"You backed the right horse," Cortez finally said. "I picked a bad one. I hope you won't hold that against me. I've grown to respect you a great deal, in spite of our differences. I wouldn't like it if you hated me."

"I don't, Hector," Anna said, taking his hand in both of hers and squeezing it. "Not at all. It was terrible, what we all went through. We all made bad decisions because we were afraid. But you're a good man. I believe that."

Cortez gave her a grateful smile and patted her hand. Anna nodded her head at the star field splashed across the wall.

"So many stars," she said. "Some of them might be ours someday."

"I wonder," Hector replied, his voice low and sad. "I wonder if we should have them. God gave man the Earth. He never promised him the stars. I wonder if He'll follow us out there."

Anna squeezed his hand again, and then let it go. "The God I believe in is bigger than all of this. Nothing we ever learn can be an attack on Him as long as that's true."

Cortez gave a noncommittal grunt.

“I want her to have them,” she said, pointing at the spray of light around her. “My little Nami, I want her to have all of that someday.”

“Whatever she finds out there,” Cortez said, “just remember it’s the future *you* chose for her.”

His words were full of hope and threat.

Like the stars.

Acknowledgments

Once again, we have more people to thank than space to thank them in. This book and this series wouldn't exist without the hard work of our agent Danny Baror and the support and dedication of Tom Bouman, Susan Barnes, Ellen Wright, Tim Holman, Alex Lencicki, and the whole crew at Orbit. Thanks to the amazing Daniel Dociu for giving us the art that people can't help but pick up off the shelf, and to Kirk Benshoff for creating that wonderful design that ties the whole series together. We'll never be able to adequately express our gratitude to Carrie, Kat, and Jayné for feedback and support, and to Scarlet for allowing us to distract her with *Mythbusters* while we work. Thanks to the *Mythbusters* crew for being so entertaining to scientifically curious six-year-olds. Thanks again to the whole Sake River gang. Much of the cool in the book belongs to them. As always, the errors and infelicities and egregious fudging was all us.

FORTUNE'S PAWN

by Rachel Bach

When professional mercenary Deviana Morris took the security guard job aboard the Glorious Fool, all she wanted was a fast route into the Devastators—the elite league of armored fighters entrusted with the most important duty on her home planet of Paradox. But this security job isn't just twelve-hour patrols, armor-polishing, and whiskey. The supposedly cursed Captain Caldwel keeps sending Devi and her partner into unimaginably dangerous situations. Ren, the captain's daughter, is a kind of weird that Devi has never experienced before. And to top it off, there's the insufferably sexy cook, Rupert Charkov, who is far more than what he seems—possibly even far more than human.

"You're quitting the Blackbirds?" The shock in Anthony's voice was at odds with the finger he was languidly sliding over my naked back. "Why? You just made squad leader last year."

"That's why," I said, swatting his finger away as I pulled on my shirt. "Nowhere left to go. Squad leader's the last promotion before they stick you in a desk job."

I stood up, grabbing my pants from the chair. Still naked, Anthony rolled over to watch me dress with growing displeasure. "I don't get you, Devi," he grumbled. "The Blackbirds are the top private armored company on Paradox. It takes most mercs ten years in a lesser outfit before they can even apply. The fact they let you in straight out of the army should be the miracle of your career. Why the hell are you leaving?"

"Some of us have ambition, Anthony," I said, sitting back down to put on my shoes. "I had five good years with the Blackbirds, made a lot of money, got my name out there. But you don't get noticed if you sit around on your laurels, do you?"

"If you got any more noticed, I think they'd have you arrested," Anthony said. "They were talking about that stunt you pulled on Tizas in the office just yesterday. The duke of Maraday's apparently thinking of offering you a fat contract with his Home Guard."

I rolled my eyes and combed my fingers through my hair, wrestling the dark brown mess into a ponytail as best I could. My hair never could take mornings. "I am *not* joining the Home Guard. I don't care how good the money is. Can you imagine me sitting around on some noble's pleasure yacht playing bouncer for his cocktail parties? No thanks."

“Home Guard is dull,” Anthony agreed, his boyish face suddenly serious. “But it’s safe.” He reached out, catching my hand as it dropped from my hair. “I worry about you, Devi. You’ve done eight full fire tours in five years. I know you want to make a name for yourself, but that kind of work will kill you, and I’m not talking about taking a bullet. If you got a job with the Home Guard, you could take it easier. Hell, if the Maraday thing actually came through, the duke never leaves the capital. You could live here, with me. I’d even let you redecorate, and we could be together every night.”

I didn’t like the way this conversation was going, but I knew better than to let that show on my face. Instead, I smiled and gently pried his fingers off mine. “It’s a sweet offer, Anthony, but I’m not looking to settle down. Here or anywhere else.”

Anthony heaved a huge sigh and collapsed on the bed. He lay there facedown for a moment, then rolled onto the floor and started pulling on his boxers. “Can’t blame me for trying.”

When he was dressed, we took the plush elevator down to the building café. I didn’t regret turning down his offer, but I had to admit Anthony had a nice setup. His apartment was in one of the new sky towers that dominated Kingston’s shoreline. Through the enormous windows, the royal capital lay spread out as far as I could see. Enormous skyscrapers rose like silver and glass trees from the dense underbrush of the older, smaller buildings. The sky was hazy with the usual smog and the clouds of commuter aircraft darting between the official sky lanes. The café was on one of the sky tower’s middle floors, but we were still high enough to see the starport and the towering shadow of the Castle behind it from our booth.

I might just be sentimental, but seeing the Castle’s shielded battlements and the shadows of the building-sized batteries of plasma guns behind it always filled me with pride. It wasn’t the tallest building in the city anymore, but the Castle was still the largest, dwarfing even the deep-space trawlers that were waiting their turn to dock in the starport below. It was a good, strong fortress, feared by all on planet and off, and a worthy guard for the Sainted Kings of Paradox.

As always, I bowed my head before my king’s sacred fortress. Anthony followed suit a second later. He’d never been as much of a believer in the power of the king as I was, but then, he hadn’t taken as many bullets as I had.

Once we’d paid our respects, Anthony called the waiter over. He ordered large and well, and the spread of food that arrived at our table was a mini-heaven all in itself. Thanking my king again, I fell to with a mercenary’s efficiency. Anthony watched me eat with amusement, drinking something red out of a tall, frosted glass that looked like a cocktail. I really hoped it wasn’t. Even I didn’t drink this early in the morning.

“So,” he said, spinning his now nearly empty glass between his fingers. “Why are you really here, Devi?”

“Last night wasn’t enough?” I said, popping a tiny coffee cake into my mouth.

“Last night was marvelous,” Anthony admitted. “But since we’ve established you aren’t exactly pining for my company, I thought we might as well get to the point before you crush my ego again.”

He was still smarting from the rejection, so I let the comment slide. I’d known Anthony a long time; we’d been in the army together before he got his captaincy and his cushy desk job with the Home Guard. We had good chemistry, and he was always the first person I called when I came home. We’d been friends with benefits for nearly seven years now, and I’d thought we had a good understanding. Obviously, things had changed. Still, this was Anthony. An apology would only make him feel worse, so I honored his request and got to the point. “I need you to tell me the qualifiers to become a Devastator.”

I had his full attention now.

“Are you out of your goddamn mind?” he cried. “*That’s* why you quit your job?” He flopped back against the booth’s deep cushions. “Devi, you can’t be serious. The Devastators are the king’s

own armored unit. They're *above* the best."

"Why do you think I want to be one?" I said. "I'm sick of wasting my time on the edge of civilized space crashing pirate camps for corporate money. Devastators serve the Sacred King directly. They get the best armor, the best guns, they go on the most dangerous and important missions. They have power you can't buy; even the nobility listens to them. I was the best in the Blackbirds—"

"This isn't like the Blackbirds," Anthony snapped. "I can't even tell you the qualifiers, because there are none. You can't apply to become a Devastator. They ask *you*, not the other way around, and they don't ask anyone who hasn't spent a minimum of twenty years in active field service."

"Twenty *years*?" I cried. "That's ridiculous!"

"They want experience—" Anthony started.

"What do you think I spent the last nine years getting?" My shouting was attracting weird looks from the other diners, but I didn't care. "I got twelve commendations in four years when I was in the army. You know, you were there. *And* I've gotten five promotions in five years in the Blackbirds. I'm not exactly fresh meat."

"Devi, you're not even thirty." Anthony's voice was calm and reasonable, the sort of voice you'd use with a child who was throwing a tantrum. It made me want to punch him. "You've already proven that you're exactly the sort of suicidally brave, workaholic lifetime soldier the Devastators look for. They'll come calling, I'd bet money on it, but not yet. Not until you've got at least ten more years on your record."

"In ten more years, I'll be dead." I said it plainly because it was a goddamn fact. The average life span of an armored mercenary was just shy of twenty-five. I was two years past that. After thirty, survival rates fell to almost nothing. Shooting for cash was a game for the young. You either got a desk job, applied to the Home Guard, or went back to your parents in a body bag. A desk wouldn't impress the Devastators any more than it impressed me, but I couldn't do crash jobs and pirate clearing forever.

"I'm good enough to serve the king right now," I said, lowering my voice. "I've seen Devastators in their thirties, so I know they make exceptions to the experience requirement. I want to know what and how, and I'm not letting you out of here until you tell me." And just in case he didn't believe me, I kicked out my leg and slammed my boot onto the booth beside him, blocking him in.

Anthony glanced at my foot with a deep sigh. "You're impossible. You know that, right?"

I didn't answer, just leaned back, crossed my arms, and waited for him to cave.

It didn't take long. Less than a minute later, Anthony shook his head and pulled out his ledger. "It just so happens you picked a good time to have your crazy idea," he said, tapping the screen with his thumb. "Here."

I took the ledger he offered, squinting to read the glowing screen in the bright sunlight. It took me a few moments to recognize the short paragraph for what it was, a job listing from the general employment boards. A tiny one, too, barely three sentences long, but what I saw was enough to make me think Anthony was seriously trying to jerk me around.

"This is for a security position on a trade freighter."

"Not just any trade freighter," Anthony said, smiling for the first time since we'd gotten out of bed. "That's Brian Caldwell's ship."

"I don't care whose ship it is," I said. "I am *not* doing guard work." Guard work was just above deep-space mine clearing for crap armor jobs. No Blackbird would be caught dead on a freighter, even an ex-Blackbird like me.

"I wouldn't have shown it to you if it wasn't something you'd be interested in," Anthony said. "Have a little faith, darling."

When I finally relaxed my scowl, Anthony went on. "Caldswell's a bit of a legend in trading circles. They say his ship is cursed. He gets into more trouble on one route than an entire fleet could find in ten years, and he goes through security teams like tissue paper. That's where you come in." He leaned closer. "Don't spread this around, but the Royal Army considers one year with Caldswell to be worth five anywhere else. If you can survive a full tour on that ship, I'm pretty sure even the Devastators would sit up and take notice."

I glanced down at the ad again. It looked perfectly normal, the sort of short-notice grunt job that kept army dropouts in beer money, nothing like the deadly golden ticket Anthony was painting it to be. "You're not putting me on, are you?"

"I wish I was," Anthony said. "Maybe you missed the part about how quickly Caldswell uses up his people? I like you as you are, all in one piece."

It was meant to laugh at his concern, but I couldn't help it. "And maybe you've forgotten who you're talking to."

"I haven't forgotten," Anthony said, his voice deadly serious. "I've seen you fight, remember? That's not something you forget. But this is the fast and dangerous route, Devi. I know you're ambitious enough for any five normal mercs, but there's nothing wrong with a life of being safe, prosperous, and happy."

"I am happy," I said, pulling out a pen and writing the dock number from the ad on the back of my hand. "And the faster I get to be a Devastator, the happier I'll be." I handed his ledger back. "You'll tell them, right?" The Devastators did whatever the king told them to, but they were technically part of the Home Guard. Anthony worked for them sometimes, which was why we were having this conversation.

"If Caldswell takes you, yes," he said. "Don't know if they'll listen, they mostly don't, but I'll be sure to tell everyone what a reckless glory hog you are."

I grinned and dropped the leg that had been fencing him in. "You're a prince as always, Anthony," I said, sliding out of the booth. "Thanks for the breakfast, and the job tip."

"I'll put them on your tab," he said. "You can settle up next time you're in town."

I kissed him on the cheek one last time and walked away. The last thing I heard before I squeezed into the crowded elevator was Anthony calling the waiter for another drink. I worried about that as the elevator whipped me down, but twenty seconds and seventy floors later, I had more immediate concerns.

The crowd on the street level was brutal, and I had to throw my weight around to break through the rush to the cab stand, something I enjoyed more than I should have. I'm five six on a good day, and between that, my bird bones, poofy brown hair, and the fact my face looks closer to thirteen than thirty, normal people tend to underestimate me. It used to piss me off to no end, but that was before I cultivated an appreciation for watching the patronizing look fall off a businessman's face when the little girl he was trying to push aside elbows him in the stomach hard enough to knock his wind out.

After a few minutes of unnecessary roughness, I'd made my way to the front of the taxi line and flagged down a ground cab. Air would have been quicker, but I wasn't in enough of a hurry to justify the cost. Fortunately, my cabbie was a stereotypical Kingston driver, utterly insane. Despite it being rush hour on a workday morning, we made it to the starport in less than twenty minutes.

He offered to take me into the departures plaza, but one look at the traffic and I told him to drop me on the street. I tipped him well for not getting us both killed and ran up the pedestrian ramp, ducking through the enormous mirrored doors with the rest of the morning crowd before taking a sharp left toward the lockers where I'd bunked my gear when Anthony had picked me up late last night.

I found my locker and opened it with a thumbscan, pulling out my duffel. My handset was on top, right where I'd left it. I flipped it open, working fast. I trusted Anthony, but only an idiot applies

for a job without doing her research first. A quick search for Brian Caldwell turned up surprisingly little, but Anthony hadn't been kidding about the prestige of serving on his ship. After five minutes of searching, I'd found no fewer than seven of his former security grunts who were now enjoying fantastic positions, including one who'd gone on to be a Devastator.

But my digging also showed that Anthony hadn't been exaggerating how dangerous Caldwell's ship was, either. The number of crew deaths and disappearances he had on file with the Trans-Galactic Trade Union was staggering for any vessel, but it was especially bad when you considered that Caldwell captained a ten-man freighter on a fairly safe route through the major systems. From his numbers, you'd have thought he was helming a battleship on a bloody front. All of this should have made me think twice, but I'd made my career by beating impossible odds. As soon as I'd verified Anthony's tip to my satisfaction, I got to work hauling my armor case out of the locker.

In addition to my fast elbow, I'm a lot stronger than most people think, a product of spending all day in armor with my resistance turned way up. Some mercs let their suit do all the work. Why bother with flesh-and-blood muscles if you're in powered armor all the time? But I don't like being weak in any way if I can help it, and real muscles come in handy when the most precious thing in your life folds up into a hundred sixty-pound case and all you can get is a top locker.

Bracing my knees, I heaved my armor case down and set it on its wheels. When it was balanced, I slung my duffel over my shoulder and started walking toward the dock number I'd written on my hand.

Considering its black reputation, I expected Caldwell's ship to look sinister, but the freighter sitting at dock C23503 was disappointingly shabby. Its belly sat directly on the ground, while its hull rose in an old-fashioned, ungraceful beige block six stories into the air. The whole ship was spotty with patches, but thanks to a fresh paint job I couldn't tell if the repairs were from cannon fire or just the usual wear and tear you saw on older vessels.

Old or not, though, Caldwell's ship was still an impressive hundred and fifty feet long from nose to thrusters, with the vast majority of that in its cargo hold. The ship's nose was boxy as the rest of it, a squat thrust of metal with its windows covered by steel shutters coated in high-burn plastic against the heat of entering the atmosphere. The tail of the ship was all engine, a pair of long-haulers and a hyperdrive coil that looked pretty new.

That gave me hope. Hyperdrive coils weren't cheap. If this Caldwell could afford a new model, he could certainly afford a top line Paradoxian armored mercenary with an exceptional record.

Like all the noncommuter ships, Caldwell's was docked in the overflow landing. But, despite being in a good spot relatively close to the main port, no other ships were docked around him. That didn't surprise me. Spacers were a superstitious bunch. Docks would have to be pretty scarce for a captain to risk leaving his ship where Caldwell's curse could reach it.

I believed the Sacred King could do miracles just like any good Paradoxian, but I didn't believe in curses. Neither did a lot of people, apparently, or maybe most mercs just didn't bother to do their research, because as I rounded the nose of the ship, I saw that the ramp in was packed with people hauling armor cases not so different from my own.

Never one to let a little competition scare me off, I walked right up and got in line. There were fifteen people ahead of me, but the crowd was dwarfed by the enormous and strangely empty cargo bay. Other than a few dusty crates lashed down in the back, the only thing inside was a suit of armor.

Unlike my armor, which could be broken down to fit in a case, this was a serious heavy combat suit, Count class, the kind the army used to rip up Terran tanks. Even powered down, it was seven feet tall and obviously someone's baby, judging from how nicely the bright yellow paint job sparkled. I scowled. Armor like that belonged to a serious professional who'd spent a lot of time in the armored corps. Clearly, someone had already gotten a job today. The ad hadn't said how many openings were available, but the ship wasn't that big. It couldn't take more than two security guards

to cover it all, and if one of those spots was already taken, then this wasn't the sure thing I'd been counting on.

I eyed the line with new rancor. None of them looked like serious competition, but then, standing around in the tight pants and flowy shirt I'd worn to meet Anthony with my hair tangled in a postsex ponytail, I probably didn't either. Nothing for it but to wait and see. I used the time to fix my appearance, brushing and braiding my hair as discreetly as I could. The line moved quickly, and by the time I was decent, I was next.

There was a stair leading up from the cargo bay to the rest of the ship where the interviews were being held. People had been going up and coming down again with only a few minutes between the whole time I'd been waiting. Some looked dejected, but most looked relieved, and I bet they were the ones who hadn't actually wanted a job on a ship that had a reputation for being a flying coffin, no matter how scarce armor work had gotten now that the king had wrapped up all our wars.

The man ahead of me was certainly one of these. He was almost grinning as he walked back down the steps and stabbed his thumb over his shoulder, letting me know it was my turn. Grabbing my bag and lifting my armor case so it wouldn't bang, I started up the stairs to tempt my fate.

The interviews were being held in what looked like a combination lounge and ship's mess. There was a tiny galley kitchen with a bar, a table for meals, and a small sitting area, all empty. My interviewer sat at a folding table with a small desk fan pointed at his face. He was older, maybe early fifties, and wearing an old-fashioned white button-up shirt and brown flight vest. His short, red-brown hair was frosted with silver, but his stocky body was still fit and solid when he stood to shake my hand and wave me to the chair.

"Name?"

I flinched. He was speaking Universal. I spoke it, of course. Everyone did. It was the standard language of civilized space. But the Blackbirds were solid Paradoxian, and we spoke our own King's Tongue exclusively in everything we did. I'd been all over the universe, but because I'd always been with my unit, I hadn't spoken Universal other than to ask where the bathroom was for almost three years.

Looking back, I don't know why I was surprised. Traders, even Paradoxians, always spoke Universal. It was, after all, the language of trade. But the man at the desk didn't look Paradoxian, he looked Terran, and that could be a problem. After so long not speaking Universal, my accent was pretty thick, which put most Terrans off. Usually, I wouldn't care. Paradoxians don't like Terrans any more than they like us. We might both be from Old Earth, but a century of border wars carries a lot more weight than a shared ancestry from some dead rock a thousand years ago. Still, if the Terran was the one with the job, then that was all water under the bridge so far as I was concerned. I'd just have to trust that he was willing to overlook a few dropped consonants in return for a stellar record.

The man glared at me, still waiting for his answer, and I snapped into business mode. "Deviana Morris," I said, pronouncing each syllable as crisply as I could. "I go by Devi."

I set my handset on the table and tapped the button for the projected screen. It flickered to life, throwing my record, commendations, and references into the air right in front of his face. The man flicked through my history with a finger, his expression neutral, though I saw his lip quirk when he got to my last tour with the Blackbirds. A glorious time, even for a glory hog like me.

"That's quite an impressive record, Miss Morris," he said at last. He spoke the words grudgingly, like he didn't like being impressed. "It's my understanding that most Paradoxian mercenaries spend their careers trying to get into the Blackbirds. Why did you leave?"

"I'd reached the top of the active duty promotions, sir."

The man smiled. "Your ambitions don't run to desk jobs, I take it?"

I smiled back. "No sir."

"Fair enough," the man said, glancing at my armor case. "What equipment are you bringing?"

My smile turned into a full-on grin. This was my favorite part of any interview. I reached down and turned my case so he could see the insignia on the front. "Custom Verdemont master craft knight's armor."

My opinion of the man rose significantly when his eyes widened in an appropriate expression of shock. "And this is your suit?" he said. "Not leased from the Blackbirds?"

"No sir," I said proudly. "I own all my own gear." It had taken me two years' wages plus some pretty extreme hazard pay to buy my armor, and it was worth every cent. "I also have my own guns and ammunition as well, and an automated repair case for my suit."

"We'll supply your ammo," the man said, leaning back in his rickety folding chair. "This is a security position. Your job will be to work with your fellow security officer to protect this ship, its crew, and its cargo at all times. We usually run a wide circuit spanning Paradoxian space, the Terran Republic, and the Aeon Sevalis, but that can change without notice. The contract is for one galactic standard year with fifteen hundred Republic Script paid monthly. Shifts are twelve hours during flight with overtime for planetary landings and time off when we're in hyperspace, plus one day paid shore leave per month. So long as you are an employee of this ship, we'll provide food, lodging, and ammunition, as I said earlier, plus a stipend for maintenance and repair of your equipment."

I considered this for a moment. It was a pretty standard contract, but the pay, while high for ship guards, was pretty low compared to what I'd earned in the Blackbirds. I might not be doing this for the money, but a merc had to protect her worth. "Is there hazard pay?"

"Thousand RS for every incident," the man said.

I bit back a smug smile. That was where the money was hiding. Considering this ship's reputation for trouble, that hazard bonus might well end up making me more than I'd earned as a squad leader.

"Sounds good to me, sir," I said, reaching for my armor case. This next bit would be pure fun. I loved showing off my armor. "What would you like me to do for my demonstration? I can do any accuracy challenge you can think of, maneuvers, a strength test, whatever you want."

"I don't think we'll need any of that," the man said, turning off my handset and handing it back. "You've got the job."

I blinked. "That's it?" I blurted before I could stop myself.

The man shrugged. "Unless another decorated ex-Blackbird with her own suit of custom, high-end armor is waiting in my cargo bay, then yes. That's it." He held out his hand. "I'm Brian Caldwell, welcome to the *Glorious Fool*."

I took his hand, head spinning. That was the fastest interview I'd ever had. "Fool?"

"The *Glorious Fool*," Caldwell repeated, smiling like this was an old joke. "My ship."

Weird name for a ship, but I didn't give it much thought. I was too busy absorbing the fact that the short, stocky man in front of me was the cursed captain, Brian Caldwell. The man who went through security like tissue paper, and I was now in his hands.

"Thank you, sir," I said before I found some way to ruin things.

The captain nodded. "We'll get you a bunk when we're ready to go. In the meanwhile, you can store your stuff behind the bar. No one will touch it."

No one but me could touch my armor without getting ten thousand volts, but I kept my mouth shut about that and stowed my bags as directed. Honestly, I was still reeling. My brain couldn't quite get around the idea that after years of fighting like a dog for every step up the ladder, I'd gotten what could well be the make or break job of my career with an interview that had taken less than five minutes.

While I was putting my things up, the captain walked over to the cargo bay door and shoved his head out. "Position's filled!" he yelled, and then he shut the door.

I thought that was a bit harsh, but the captain seemed to have forgotten the other applicants entirely the moment he turned away. "I have to go take care of some business," he said, walking past me toward the hall on the opposite side of the lounge. "Basil will get you settled. He's my second, and you'll obey him as you would me."

"Yes sir," I said, following him. "Who else do I follow?"

"Mabel, our engineer." The captain wasn't looking at me, but I caught his smile and gave myself a mental pat on the back. I'd impressed him. "But she won't be here until later. For now, just worry about making Basil happy. You'll find him on the bridge, straight ahead."

He nodded down the hall toward a closed door at the opposite end. I noted it and then turned to face my new captain head-on. "Yes sir," I said, bowing formally from the waist as was proper now that he was my superior. "It will be an honor to serve you, sir."

The captain shook his head. "This is a Terran ship, Morris. We don't do any of that bowing and scraping here. Just do your job, obey orders, don't backtalk too much, and we'll all be happy."

"Yes sir," I said, without the bow this time. Not bowing to a superior went against my training, but it was his ship. If he didn't want me bowing, I was happy not to. Bowing to a Terran felt a little blasphemous.

The captain nodded and walked down the hall away from me, toward the engines. I watched him until he started down the spiral stairs to the lower levels and then turned toward the bridge as ordered. The hall ran down the ship like a backbone with the bridge as its head. Surprisingly, though the hall was reasonably clean, it was almost as patched as the ship's hull.

The outside damage I could understand; pirates liked to take potshots, but the hall's gray metal walls were peppered with blaster burns, bullet holes, even a few blast shadows from what I could only imagine were grenades. I've walked down worse, but not many, and only in war zones. Whatever had happened here had been serious, and I made a mental note to ask how the last security team had ended their tour.

The bridge door slid open the second I stepped up. I marched inside and stopped at parade rest just as I had back in my army days, glancing around for this Basil I was supposed to be taking orders from. What I saw confused me greatly.

The bridge itself was a perfectly normal three-layer setup and far less scarred than the hall had been, though there was still a bullet hole in the ceiling. At the top where I stood was the monitor deck and systems desk, both empty. Down a step was the captain's chair, its leather seat and consoles worn nearly black from years of use. But at the bottom of the bridge, the seat at the ship's nose where the pilot usually sat was gone. In its place was what looked like a nest of bright-colored fabric, and sitting in this nest was a very large bird wearing a headset.

I'd seen aeons before, but never in person, and certainly never this close. The ones I'd seen had been brightly colored, pink and blue and green and every other neon hue you'd expect from a giant alien bird. This one was brown as a common sparrow. Sitting in its nest, it looked like an overgrown fluffy stork with short chocolate and cream feathers layered over white down. Its neck was long as my arm, and the head at the top was crested with a ridge of rust-red feathers that bobbed back and forth as the aeon studied the projected star map in front of it. Its wings, which looked large enough to be useful, were folded at its sides, each one tipped with four tiny, clawlike fingers at the joint, but the bird wasn't using them. Instead, it was tapping the ship's flight handle impatiently with its long feet, the yellow talons clicking so fast on the padded grip I could barely follow them.

Despite being the most populous race in the galaxy, beating out even humans for sheer numbers, the aeons stuck to their Sevalis and their own kind. I'd heard they disliked the other races with a passion bordering on violent xenophobia, which was a waste, because they were supposed to be the best navigators in the universe. Once I got over my initial shock at seeing a large alien bird sitting in

a literal pilot's nest, that fact that Caldwell actually had an aeon to fly this hunk of junk ship was what astonished me the most.

The bird hadn't noticed me yet, and I took a moment trying to decide if it was safer to call the thing sir or ma'am. Neither seemed good. I didn't even know if aeons had the usual genders, actually. But since this was a Terran ship with no appreciation for proper hierarchy, I decided to risk dropping the honorific, just this once.

"Excuse me," I said. "Are you Basil?"

The aeon's head whipped around, and I found myself being glared at by a pair of yellow eyes as large as my fists with round, black pupils set in a flat face above a long, curving yellow beak that practically dripped with disapproval. "Oh goody," it said. "A Paradoxian."

The bird's voice was more like a whistle than words, but I didn't like the tone of it one bit. "That's what you get when you advertise for a security team on Paradox," I said, fighting the urge to cross my arms and glare.

The aeon arched a feathered eye ridge and then, in a flurry of flapping, launched itself into the air. It cleared the captain's chair in one leap and landed right in front of me. Standing, the bird's head was a foot higher than mine. Its yellow eyes gleamed as it set down, no doubt waiting for me to scramble out of the way. But I'd faced down much scarier things than overgrown chickens with bad attitudes, and I held my ground.

The bird looked disappointed. "My name is"—it gave a shrill whistle that faded into a chirp. "But your soft human palate couldn't possibly manage that, so you may call me Basil. I'm the *Glorious Fool's* navigator and Captain Caldwell's second in command. You will address me as sir at all times."

"Yes sir," I said, hiding a smile. An officer with literal feathers to ruffle. This was going to be rich. "The captain said you would show me around."

The bird heaved an exaggerated sigh and pushed past me. "Come along, monkey. And don't touch anything."

We spent the next hour going over a ship that should have taken ten minutes to walk through. The *Fool* had the fairly standard spacer setup of cargo bay, engine room, lounge, two levels of crew cabins, and a surprisingly nice infirmary (or not so surprising with as much action as this ship supposedly saw). The most interesting thing I noticed was that the damage I'd seen in the main hallway continued through most of the ship.

Hearing about trouble was one thing, but going by battle scars I'd say the *Fool* saw more action than my former crash team's ship, which we routinely dropped on pirate camps. Everywhere I looked, things had been damaged and patched over. Even the out-of-the-way bulkheads were burned or scraped in some fashion, and more than a few still had bullets lodged in them. The floor was rubber coated for traction, but the coating was melted in several places from what looked like plasma blasts. We didn't run into any other crew members, but that didn't matter. In between boring me to tears with details of the ship's mechanics, Basil took every opportunity to talk about them.

"As our engineer, Mabel is responsible for everything mechanical," he said as we walked up the tiny spiral stair from the engine room. "You'll obey her as you obey the captain or myself. Nova is our systems analyst. She helps me run the bridge. The two of you will be bunking together until I can talk some sense into the captain."

His head swiveled to glare at me. "Honestly, if we weren't short on room, I'd never have let it happen. A nice girl like Nova shouldn't be exposed to Paradoxians. Sometimes I don't think you people even understand words that don't have to do with armor, fighting, and king worship."

"We also talk about shooting, sir," I said dryly. "And bird hunting."

"Good thing for us then that you and that other idiot are the only of your barbaric kind here," Basil snapped, feathers standing on end. "Though two is more than enough." He pressed his wingtip

to his head. “Moving on, and do try to remember this because I’m not telling you again, cleaning duty follows a standard rotation. The cook takes care of the lounge, but all other responsibilities are shared between the crew. You’ll be expected to contribute at least five hours a week or face a pay dock. In addition, our records require that you file daily reports...”

I tried not to let my eyes glaze over as I tuned him out. Normally, I am the perfect picture of the professional merc. I try not to swear because swearing is for grunts, not officers. I maintain decorum, I follow orders, I never drink on duty, and I do my job with a flair and efficiency designed to land me glowing reports. But after half an hour of listening to Basil squawk, my professional front was starting to crumble.

Even without the bird’s talk about cleaning rotations, the tour had been unappealing. The blast marks were exciting, true, but the rest of my duties sounded dull as, well, guard duty. I had a patrol path I was supposed to maintain during flight, hourly check-ins, report writing, inventory control, all the routine, mind-numbing idiocy that had led me to avoid guard jobs like the plague my whole career. Much as I’d grown to dislike crashing pirate camps over the last five years, the idea of hopping out of a drop ship on some remote moon and landing on a pirate’s head was starting to sound like heaven at the moment. When the bird turned us into the lounge and launched into a lecture on fire regulations *again*, I rolled my eyes to the ceiling and prayed to my king that all those dead security teams had actually died in combat and not from boredom.

Basil’s safety lecture was interrupted by the sound of someone coming up the cargo bay stairs. I looked over, hoping to see the captain or maybe my fellow security team member, anyone who could save me from the bird. But it wasn’t the captain or a merc, it was a girl. I placed her at about fourteen, maybe a little older. She was dark skinned with a cap of straight dark hair cut just above her shoulders and almond eyes that were almost too focused as they moved from me to Basil.

If it hadn’t been a horrible breach of decorum, I would have rolled my eyes again. I hate kids when I’m working. If Caldsell tried to make me babysit on top of report writing, I was going to tell him he could shove this job, fantastic recommendation or no. I was already working out all the excuses I could use to get out of any potential kid duty when I caught sight of the man behind the girl and everything else became superfluous.

Now this, this was more like it. The man was gorgeous. He was tall and pale, but beautifully so, with shoulder-blade-length black hair tied at his neck. His eyes were a lovely bright blue under dark eyebrows, and his mouth looked quick to smile. He was wearing a black suit, not the ones they wore in Kingston with the wide lapels, but the old-fashioned Terran kind with the high collar that I’d always considered dashing. Even hidden behind the girl, I could see enough of his posture to know that he had some military training. Combine that with his long-fingered hands and broad, sloping shoulders and I was suddenly feeling much, much better about this job.

“Ah,” Basil said, his snarky tone fading just a hair. “This is Ren, the captain’s daughter.”

It took me a few seconds to realize Basil was talking to me. I looked away from the man with some difficulty and studied the girl instead. She must have taken after her mother, I decided, because no matter how much I looked, I could see nothing of the stocky Captain Caldsell in the girl’s dark, delicate features. The disconnect made me curious, but I stomped down the urge to question. Nosy mercs were dead mercs. Instead, I nodded to the girl politely: “Miss Caldsell.”

Ren didn’t even look at me. She just walked past Basil and me like we weren’t there and sat down on the couch behind us.

If her antisocial behavior bothered him, Basil didn’t let it show. A second later, I let it go as well, because Basil was now introducing the man. “This is our cook.”

The tall man’s face broke into a smile that only made him more handsome as he held out his hand. “Rupert Charkov,” he said, his voice curling around the letters with a soft accent I couldn’t place.

“Devi Morris,” I replied, doing my best not to let my own, far less attractive accent leak through as I took his hand.

When you live around mercs, you get used to bone-crushing handshakes. It’s a dominance thing, a power game, and like all games, I play to win. But Rupert took me by surprise, closing his hand around mine gentle as a caress. His soft grip forced me to dial back my own at the last second, which had the funny effect of sending my fingers sliding under his in a way that felt shockingly intimate between two people who’d just met.

Rupert must have felt it too, because the sudden, knowing look he gave me made his eyes sparkle. “I look forward to working with you, Devi.”

“Same,” I said. I could certainly stand hearing him say my name in that lovely accent a few more times.

Terrans accuse Paradoxians of being overly forward and completely unable to comprehend subtlety. I think that’s an exaggeration, but I have to admit I watched Rupert blatantly as he walked behind the kitchen counter and began moving supplies from the bag he’d been carrying into the fridge. I can’t help it, I’m not a subtle girl. When I see something I like, I go for it, and I liked what I saw very much. Even unloading groceries, Rupert moved gracefully, and as Basil led me back toward the bridge, all my earlier misgivings seemed less damning. Yes, I decided, Rupert would definitely make this job more bearable. All I needed now was for my fellow security merc to be minimally competent and this guard business might not be half bad.

Feeling more confident than I had since Caldwel told me I’d gotten the job, I strode after Basil, nodding where appropriate as he started explaining the dreadful burden of navigation, which my unevolved brain couldn’t possibly comprehend.

THE CHURN

Burton was a small, thin, dark-skinned man. He wore immaculately tailored suits, and kept the thick black curls of his hair and the small beard on his chin neatly groomed. That he worked in criminal enterprises said more about the world than about his character. With more opportunities, a more prestigious education, and a few influential dorm mates at upper university, he could have joined the ranks of transplanetary corporate executives with offices at Luna and Mars, Ceres Station and Ganymede. Instead, a few neighborhoods at the drowned edges of Baltimore answered to him. An organization of a dozen lieutenants, a couple hundred street-level thugs and knee-breakers, a scattering of drug cooks, identity hackers, dirty cops, and arms dealers followed his dictates. And a class of perhaps a thousand professional victims—junkies, whores, vandals, unregistered children, and others in possession of disposable lives—looked up to him as he might look up at Luna: an icon of power and wealth glowing across an impassable void. A fact of nature.

Burton's misfortune was to be born where and when he was, in a city of scars and vice, in an age when the division in the popular mind was between living on government-funded basic support or having an actual profession and money of your own. To go from an unregistered birth such as his to having any power and status at all was an achievement as profound as it was invisible. To the men and women he owned, the fact that he had risen up from among the lowest of the low was not an invitation but a statement of his strength and improbability, mythical as the seagull that flew to the moon. Burton himself never thought about it, but that he had managed what he did meant only that it was possible. Anyone who had not had his determination, ruthlessness, and luck deserved pretty much whatever shit he handed to them. It didn't make him sympathetic when someone stepped out of line.

“He...what?” Burton said

“Shot him,” Oestra said, looking at the table. Around them, the sounds of the diner made a white noise that was like privacy.

“Shot. Him.”

“Yeah. Austin was talking about how he was good for the money, and how he just needed a few more days. Before he could finish, Timmy took that shitty homemade shotgun of his and—” Oestra made a shooting motion with two fingers and a thumb, the movement turning seamlessly into a shrug: a single gesture of violence and apology. Burton leaned back in his chair and looked over at Erich as if to say, *I think your puppy peed on my rug.*

Erich had recommended Timmy, had vouched for him, and so was responsible if things went wrong. It felt like they were going very wrong. Erich leaned forward, resting on his good elbow, hiding his fear with forced casualness. His bad arm, the left, was no longer than a six-year-old’s and scarred badly at the joints. His disfigurement was the result of a beating he’d suffered as a child. It wasn’t a fact that he’d shared with Burton, nor would he mention it now, though it did figure into the calculations that were his life. As did Timmy.

“He had a reason,” Erich said.

“He did?” Burton said, raising his eyebrows with feigned patience. “And what was it?”

Erich’s stomach knotted. His bad hand closed in a tiny fist. He saw the hardness in Burton’s eyes, and it reminded him that even with his knowledge, even with his skills, there were others who could fake identity records. Others who could fake DNA profiles. Others who could do for Burton what he did. He was expendable. It was the message Burton meant him to take.

“I don’t know,” he said. “But I’ve known Timmy since forever, yeah? He doesn’t do anything unless there’s a reason.”

“Well,” Burton replied, pulling the word out to two syllables. “If it’s since *forever*, I guess that makes it all right.”

“Just, you know, if he did that, he did it for something.”

Oestra scratched his arm, scowling to hide the relief he felt at Burton’s focus turning to Erich. “I got him in the storage room.”

Burton stood up, pushing back his chair with the backs of his knees. The

waitress made a point not to look at the three as they moved across the room and out through the doors marked EMPLOYEES ONLY, Burton and then Oestra and Erich limping at the back. She didn't even start cleaning the table until she was sure they were gone.

The storage room was claustrophobic to begin with and lined with boxes, making it even smaller. Cream-colored degradable storage boxes with flat green adhesive readouts on the side that listed what they contained and whether the cheap, disposable sensors in the foam had detected rot and corruption. The table in the cramped open space at the center was pressed particleboard, as much glue as wood. Timmy sat at it, the LED fixture overhead throwing the shadow of his brow down into his eyes. He was barely halfway into his second decade of life, but the red-brown hair was already receding from his forehead. He was strong, tall, and had an unnerving capacity for stillness. He looked up when the three men came in, dividing his smile equally among his childhood friend, the professional thug he'd just disappointed, and the thin, well-dressed man who controlled everything important in his life.

"Hey," Timmy said to any of them.

Erich moved to sit at the table, saw that Oestra and Burton were standing motionless, and pulled back. If Timmy noticed, he didn't say anything.

"I hear that you killed Austin," Burton said.

"Yeah," Timmy said. The empty smile changed not at all.

Burton pulled out the chair opposite Timmy and sat. Oestra and Erich carefully didn't look at each other or at Burton. The object of all their attention, Timmy waited amiably for whatever came next.

"You care to tell me why you did that?" Burton asked.

"It's what you said to do," Timmy said.

"That man owed me money. I told you to get whatever you could from him. This was your tryout, little man. This was your game. Now, how do you go from what I actually *said* to what you *did*?"

"I got whatever I could get," Timmy replied. There was no fear in his voice or his expression, and it left Burton with the sense he was talking to an idiot. "I couldn't get money out of that guy. He didn't have any. If he had, he'd have given it to you. Only thing you were getting from him was a way to make sure everyone else pays you on time. So I took that instead."

“Really?”

“Yup.”

“You’re positive—you’re *convinced*—that Austin wouldn’t have gotten my money?”

“I don’t mean to second-guess why anybody gave it to him in the first place,” Timmy said, “but that guy never met a dollar he didn’t snort, shoot, or drink away.”

“So you thought it through, and you came to the conclusion that the wise and right thing to do was escalate this little visit from a collection run to a murder?”

Timmy’s head tilted a degree. “Didn’t spent a lot of time thinking about it. Water’s wet. Sky’s up. Austin gets you more dead than alive. Kind of obvious.”

Burton went silent. Oestra and Erich didn’t look at him. Burton rubbed his hands together, the hiss of palm against palm the loudest noise in the room. Timmy scratched his leg and waited, neither patient nor impatient. Erich felt a growing nausea and the certainty that he was about to watch an old friend and protector die in front of him. His stunted hand opened and closed and he tried not to swallow. When Burton smiled his small, amused smile, the only one who saw it was Timmy, and if he understood it, he didn’t react.

“Why don’t you wait here, little man,” Burton said.

“Arright,” Timmy said, and Burton was already walking out the door.

Out in the café, the lunch rush had started. The booths and tables were filled, and a crowd loitered in the doorway, scowling at the waitresses, the diners who had gotten tables before them, and the empty place reserved for Burton and whoever he chose to have near him. As soon as he took his chair, the waitress came over, her eyebrows raised, as if he were a new customer. He waved her away. There was something about sitting at an empty table in full view of hungry men and women that Burton enjoyed. *What you want, I can take or I can leave*, it said. *All I want is to keep your options for myself*. Erich and Oestra sat.

“That boy,” Burton said, letting the words take on an affected drawl, “is some piece of work.”

“Yeah,” Oestra said.

“He’s good at what he does,” Erich said. “He’ll get better.”

Burton was quiet for a long moment. A man at the front door pointed an angry finger toward Burton's table, demanding something of the waitress. She took the stranger's hand and pushed it down. The angry man left. Burton watched him go. If he didn't know any better, this wasn't the place for him.

"Erich, I don't think I can take your friend off his probation period. Not with this. Not yet."

Erich nodded, the urge to speak for Timmy and the fear of losing Burton's fickle forgiveness warring in his throat. Oestra was the one to break the silence.

"You want to give him another job?" The words carried a weight of incredulity measured to the gram.

"The right job," Burton said. "Right one for now, anyway. You say he watched out for you, growing up?"

"He did," Erich said.

"Let him do that, then. Timmy's going to be your personal bodyguard on your next job. Keep you out of trouble. See if you can keep him out of trouble too. At least do better than Oey did with him, right?" Burton said and laughed. A moment later Oestra laughed too, only a little sourly. Erich couldn't manage much more than a sick, relieved grin.

"I'll tell him," he said. "I'll take care of it."

"Do," Burton said, smiling. An awkward moment later, Erich got up, head bobbing like a bird's with gratitude and discomfort. Burton and Oestra watched him limp back toward the storage room. Oestra sighed.

"I don't know why you're cultivating that freak," Burton's lieutenant said.

"He's off the grid and he cooks good identity docs," Burton said. "I like having someone who can't be traced keeping my name clean."

"I don't mean the cripple. I mean the other one. Seriously, there's something wrong with that kid."

"I think he's got potential."

"Potential for what?"

"Exactly," Burton said. "Okay, so tell me the rest. What's going on out there?"

Oestra hoisted his eyebrows and hunched forward, elbows on the table. The kids running unlicensed games by the waterfront weren't coming up

with the usual take. One of the brothels had been hit by an outbreak of antibiotic-resistant syphilis; one of the youngest boys, a five-year-old, had it in his eyes. Burton's neighbor to the north—an Earthbound branch of the Loca Griega—were seeing raids on their drug manufacturing houses. Burton listened with his eyelids at half-mast. Individually, no one event mattered much, but put together, they were the first few fat raindrops in a coming storm. Oestra knew it too.

By the time the lunch rush ended, the booths and tables filling and emptying in the systole and diastole of the day's vast urban heart, Burton's mind was on a dozen other things. Erich and Timmy and the death of a small-time deadbeat weren't forgotten, but no particular importance was put on them either. That was what it meant to be Burton: those things that could rise up to fill a small person's whole horizon were only small parts of his view. He was the boss, the big-picture man. Like Baltimore itself, he *weathered* storms.

* * *

Time had not been kind to the city. Its coastline was a ruin of drowned buildings kept from salvage by a complexity of rights, jurisdictions, regulations, and apathy until the rising sea had all but reclaimed them for its own. The Urban Arcology movement had peaked there a decade or two before the technology existed to make its dreams of vast, sustainable structures a reality. It had left a wall seven miles long and twenty stories high of decaying hope and structural resin that reached from the beltway to Lake Montebello. At the street level, electric networks laced the roadways, powering and guiding the vehicles that could use them. Sparrows Island stood out in the waves like a widow watching the sea for a ship that would never come home, and Federal Hill scowled back at the city across shallow, filthy water, emperor of its own abandoned land.

Everywhere, all through the city, space was at a premium. Extended families lived in decaying apartments designed for half as many. Men and women who couldn't escape the cramped space spent their days at the screens of their terminals, watching newsfeeds and dramas and pornography and living on the textured protein and enriched rice of basic. For most, their forays into crime were halfhearted, milquetoast affairs—a

backroom brewer making weak, unregulated beer; a few kids stealing a neighbor's clothes or breaking their furniture; a band of scavengers with scrounged tools harvesting metal from the buried infrastructure of the city that had been. Baltimore was Earth writ small, crowded and bored. Its citizens were caught between the dismal life of basic and the barriers of class, race, and opportunity, vicious competition and limited resources, that kept all but the most driven from a profession and actual currency. The dictates of the regional administration in Chicago filtered down to the streets slowly, and the local powers might be weaker than the government, but they were also closer, the gravities of law and lawlessness finding their balance point somewhere just north of Lansdowne.

Time had not been kind to Lydia either. She wasn't one of the unregistered, but very little of what was important in her life appeared in the government records. There, she was a name—not Lydia—and an address where she had never lived. Her real home was four rooms on the fifth floor of a minor arcology looking out over the harbor. Her real work was keeping track of inventory for Liev, one of Burton's lieutenants. Before that, she had been his lover. Before that, she had been a whore in his stable. Before that, she had been someone else who she could hardly remember anymore. When she was alone, and she was often alone, the narrative she told herself was of how lucky she was. She'd escaped basic, she'd had dear friends and mentors when she was working, she'd been able to retire up in the ad hoc structure of the city's underworld. Many, many people hadn't been anywhere near as fortunate as she had been. She was growing old, yes. There was gray in her hair now. Lines at the corners of her eyes, the first faint liver spots on the backs of her hands. She told herself they were the evidence of her success. Too many of her friends had never had them. Never would. Her life had been a patchwork of love and violence, and the overlap was vast.

Still, she hung warm-colored silk across her windows and wore the silver bells at her ankles and wrists that were the fashion among much younger women. Life, such as it was, was good.

The evening sun hung over the rooftops to the west, the late summer heat thickening the air. Lydia was in the little half-kitchen warming up a bowl of frozen hummus when the door chimed and the bolts clacked open. Timmy came in, lifting his chin in greeting. She smiled back, raising an eyebrow.

There was no one with him, and there never would be. They had never allowed someone else to be with them when they were together. Not since the night his mother died.

“So, how did it go?”

“Kind of fucked it up, me,” Timmy said.

Lydia’s heart went tight and she tried to keep her voice calm and light. “How so?”

“Burton told me to get what I could out of this guy. Looking back, I think he just meant money. So.” Timmy leaned against the couch, hands deep in his pockets, and shrugged. “Oops.”

“Was Burton angry?”

Timmy looked away and shrugged again. With that motion, she could see him again as he’d been as a young boy, as a child, as a baby. She had known his mother when they’d worked together, each watching out for the other when they turned tricks. Lydia had been there the night Timmy was born among the worn tiles and cold lights of the black-market clinic. She’d made him soup the night Liev had turned him out the first time and while he ate told him lies about her first time with a john to make him laugh. She’d picked music with him for his mother’s memorial and told him that she’d died the way she’d lived, and not to blame himself. She had never been able to protect him from anything, so she’d helped him live in the jagged world, and he gave her something she couldn’t describe or define but that she needed like a junkie craved the needle.

“How angry is he?” she asked carefully.

“Not that bad. I’m gonna be watching Erich’s back for a while. He’s got some things need doing, and the boss doesn’t want anything going pear-shaped. So that’s all right.”

“And you? How are you?”

“Eh. I’m good,” Timmy said. “I think I’m coming down with something. Flu, maybe.”

She walked out from the kitchen, her food abandoned, and put the back of her hand to his forehead. His skin felt cool.

“No fever,” she said.

“Probably nothing,” he said, pulling his shirt up over his head. “I got the shakes a little, and I got dizzy a couple times on the way back. It ain’t serious.”

“What happened to the man Burton sent you to?”

“I shot him.”

“Did you kill him?” Lydia asked as she walked back to her bedroom. The ruddy light of sunset filtered through yellow silk. An old armoire stood against one wall, its silver finish stained and corroded by years. The bed was the same cheap foam queen-sized she’d had when she was working, the sheets old and thin, softer than skin with wear.

“Used a shotgun about a meter from his chest,” Timmy said, following her. “Could have stuck your fist through the hole. So, yeah, pretty much.”

“Have you ever killed a man before?” she asked, lifting her dress up over her thighs, her hips, her head.

Timmy undid his belt, frowning. “Don’t know. Beat some guys pretty bad. Maybe some of ’em didn’t get back up, but no one I know about. You know, not for sure.”

Lydia unhooked her bra, letting it slide to the cheap carpet. Timmy took his pants down, kicking them off with his shoes. He didn’t wear underwear, and his erect penis bobbed in the air like it belonged to someone else. There was no desire in his expression, and only a mild distress.

“Timmy,” she said, lying back on the bed and lifting her hips. “You aren’t getting ill. You’re traumatized.”

“Y’think?” He seemed genuinely surprised by the thought. And then amused by it. “Yeah, maybe. Huh.”

He pulled her underwear down to her knees, her ankles. “My poor Timmy,” she murmured.

“Ah shit,” he said, lowering his body onto hers. “I’m all right. At least I’m not getting sick.”

Sex held few mysteries for Lydia. She had fucked and been fucked by more men than she could count, and she’d learned things from each of them. Ugly things sometimes. Sometimes beautiful. She understood on a deep, animal level that sex was like music or language. It could express anything. Love, yes. Or anger, or bitterness, or despair. It could be a way to grieve or a way to take revenge. It could be a weapon or a nightmare or a solace. Sex was meaningless, and so it could mean anything.

What she and Timmy did to and for and with each other’s bodies wasn’t a thing they discussed. She felt no shame about it. That other people would see only the perversion of a woman and the boy she’d helped raise

pleasuring one another meant that other people would never understand what it mean to *be* them, to survive the world they survived. They were not lovers, and never would be. They were not surrogate mother and incestuous son. She was Lydia, and he was Timmy. In the bent and broken world, what they did fit. It was more than most people had.

After, Timmy lay beside her, his breath still coming in small, reflexive gulps. Her body felt pleasantly tender and bruised. The yellow over the window was fading into twilight, and the rumble of air traffic was like constant thunder in the distance, or a city being shelled two valleys over. A transport ship for one of the orbital stations, maybe. Or a wing of atmospheric fighter planes on exercises. So long as she didn't look, she could pretend it was anything. Her mind wandered, delivering up what had been nagging at her since Timmy had told her all that had happened.

Burton had sent Timmy to collect a debt, Timmy had killed the man instead, and Burton hadn't cut him loose. Two points defined a line, but three defined the playing field. Burton didn't always have need of boys like Timmy, but sometimes he did. Right now, he did.

Lydia sighed.

The churn was coming. It was the name Liev had given it, back before. All of nature had its rhythms, its booms and busts. She and Timmy and Liev and Burton were mammals, they were part of nature, and subject to its rules and whims. She had lived through perhaps three, perhaps four such catastrophes before. Enough that she knew the signs. Like a squirrel gathering food before a hard winter, Burton collected violent men before the churn. When it came, there would be blood and death and prison sentences and maybe even a curfew for a time. Men like Timmy would die by the dozen, sacrificed for things they didn't know or understand. Maybe even some of Burton's lieutenants would fall the way Tanner Ford had back when she'd been Liev's lover. Or Stacey Li before him. Or Cutbreath. The history of her corrupted world echoed with the names of the dead; the expendable and the expended. If Burton had kept Timmy on, it was because he thought it was coming. And if Burton thought it was coming, it probably was.

Timmy's breath was low and deep and regular. He sounded like a man asleep, except his eyes were open and fixed on the ceiling. Her own skin was cool now, the sweat dried or nearly so. A fly swooped through the air

above them, a gray dot tracing a jagged path, turning and dodging to avoid dangers that weren't there. She lifted her first two fingers, cocked back her thumb, and made a thin cartoon shooting sound with her teeth and tongue. The insect flew on, undisturbed by her small and violent fantasy. She turned her head to look at Timmy. His expression was blank and empty. He was still, and even in the warmth that followed orgasm, there was a tension in his body. He wasn't a beautiful boy. He'd never be a beautiful man.

Someday, she thought, I will lose him. He will go off on some errand and he will never come back. I won't even know what happened to him. She probed at the thought like a tongue-tip against the sore gum where a tooth has been knocked out. It hurt and hurt badly, but it hadn't happened yet, and so she could bear it. Best to prepare herself now. Meditate upon the coming loss so that when it came, she was ready.

Timmy's eyes clicked over toward her without his head shifting at all, without any expression coming to his face. Lydia smiled a slow, languorous smile.

"What are you thinking?" she asked.

He didn't answer.

The catastrophe began four days later. Quietly, and with near-military precision, the city opened a contract with Star Helix security. Soldiers from across the globe arrived in small groups and sat through debriefings. The plan to end the criminal networks operating in Baltimore would be announced after the fact, or at least after the first wave. The thought, widely lauded by the self-congratulatory minds in administration, was to take the criminal element by surprise. In catching them flat-footed, the security teams could cripple their networks, break their power, and restore peace and the rule of law. The several unexamined assumptions in the argument remained unexamined, and the body armor and riot control weapons were distributed in perfect confidence that the enforcers would arrive unanticipated.

In fact, what Burton and Lydia knew from experience, many, many others felt by instinct. There was a discomfort in the streets and alleys, on the rooftops, and behind the locked doors. The city knew that something was near. The only surprise would be in the details.

Erich felt it like an itch he couldn't scratch. He sat on the rotting concrete curb, drumming the fingers of his good hand against his kneecap.

The street around him was the usual mix of foot traffic, bicycles, and wide blue buses. The air stank. The sewage lines this near the water were prone to failures. A few doors to the east, a group of children were playing some kind of complex game with linked headsets, their arms and legs falling into and out of phase with each other. Timmy stood on the sidewalk, squinting up into the sky. Behind them was a squatter's camp in an old ferrocrete apartment block. In a locked room at its center, Erich's custom deck was set up and primed, connected to the network and prepared to create a new identity from birth records to DNA matching to backdated newsfeed activity for the client, as soon as she arrived. Assuming she arrived. She was fifteen minutes late and, though they had no way to know it, already in custody.

Timmy grunted and pointed up. Erich followed the gesture. Far above, a star burned in the vast oceanic blue, a plume of fire pushing a ship out of the atmosphere. Near the horizon, the half moon glowed pale, a network of city lights crossing the shadowy meridian.

"Transport," Erich said. "They use mass drivers for the stuff that can take the gees."

"I know," Timmy said.

"Ever want to go up there?"

"What for?"

"I don't know," Erich said, staring down the street for the client. He'd seen her picture: a tall Korean woman with blue hair. He didn't know who she'd been before, and he didn't much care. Burton wanted her made into someone new. "Piss out the window and make everyone down here think it was raining, maybe."

Timmy's chuckle sounded polite.

"It's what I'd do, if I could," Erich said, making a swooping gesture with his good hand. Zoom. "Get up the well and out of here. Go where no one cares about who you are so long as you're good at what you do. Seriously, it's the wild fucking west up there. You want nineteenth-century Tombstone, Arizona, it's alive and well on Ceres Station. From what I heard, anyway."

"Why don't you go, then?" Timmy said. With a different intonation, it could have been dismissive. Instead it was only a mild kind of curiosity. It was part of what Erich liked about Timmy. There was almost nothing he

seemed to feel deeply.

“Starting from here? I’d never make it. I’m not even a registered birth.”

“You could tell them,” Timmy said. “People get registered all the time.”

“And then they get tracked and monitored and wind up dying on basic,” Erich said. “Anyway, no one’s taking me for a vocational. Waiting lists for that are eight, ten years long. By the time I came up, I’d have aged out.”

“Could build one, couldn’t you?” Timmy asked. “Make a new identity and put it at the front of the list?”

“Maybe,” Erich said. “If you gave me a couple years to layer it all in like I did for Burton. He can go *anywhere* with docs I built for him.”

“So why don’t you go, then?” Timmy asked again, his inflection as much an echo as his words.

“Guess I don’t want it bad enough. Anyway, I’ve got real stuff to do, don’t I? I wish she’d fucking get here, right?” Erich said, unaware that he made everything a question when he wanted to change the subject. Unconsciously, he made a fist with the hand of his bad arm. Timmy nodded, squinting down the street for the client that wasn’t coming.

Most of their lives had been spent on streets like this. The trade that exploited prostitutes and their illegal children was the second largest source of unregistered births in the city. Only religious radicals accounted for more. It was impossible to know how many unregistered men and women were eking out lives on the margin of society in Baltimore or how many had lived and died unknown to the vast UN databases. Erich knew of perhaps a hundred scattered among the legitimate citizens like members of a secret society. They congregated in condemned buildings and squats, traded in the gray-market economy of unlicensed services, and used their peculiar anonymity where it was most helpful. Looking down the pocked asphalt street, Erich could count three or four people that he personally knew were ghosts in the great world machine. Counting him and Timmy, that was half a dozen all breathing the same air while the plume of the orbital transport marked the sky gold and black above them. There was old water in the gutters, black circles of gum and tar on the sidewalk, the combined smell of urine and decay, and ocean all around them. Erich looked up at the sky with a longing he resented.

He knew himself well enough to recognize that he was a man of desires and grudges, so well in fact that he’d come to peace with it. The blackness

of space where merit counted more than the placement on a bureaucrat's list, where the brothels were licensed and the prostitutes had a union, where freedom was a ship and a crew and enough work to pay for food and air. It called to him with a romance that made his heart ache. On Ceres or Tycho or Mars, the medical technology was available to regrow his crippled arm, to remake his shortened leg. The same technology could be found fewer than eight miles from the filthy curb where he sat, but with the triple barriers of being unregistered, basic medical care waiting lists, and his own ability to function despite his disabilities, space was closer. Out there, he could be the man he should have been. The thought was like the promise of sex to a teenager, rich and powerful and frightening. Erich had resolved a thousand times to make the effort, to build himself an escape identity and shrug off the chains of Earth, of Baltimore, of the life he'd lived. And a thousand and one times, he had postponed it.

"Get up," Timmy said.

"You see her?" Erich said.

"Nope. Get up."

Erich shifted, frowning. Timmy was looking east with an expression of mild curiosity, a casual witness at someone else's wreck. Erich stood. At the intersection a block down, two armored vans had pulled to a stop. The logo on their sides was a four-pointed star. Erich couldn't tell if the people getting out were men or women, only that they were wearing riot gear. Metallic fear flooded his mouth. Timmy put a strong hand on his shoulder and pushed him gently but implacably across the street. Two more vans came to a halt at the intersection to the north.

"What the fuck?" Erich said, his voice distant and shrill in his own ears.

Timmy got him across the street and almost up to the doors of a five-story squat before Erich pulled back. "My deck. My setup. We've got to go back for it."

A deep, inhuman voice broke the air, the syllables designed in a sound lab to be sharp, clear, and intimidating. *This is a security alert. Remain where you are with your hands visible until security personnel clear you to leave. This is a security alert.* At the intersection, teams of armored figures were already questioning three men. One of the civilians—a thin, angry man with close-cropped black hair and dark olive skin—shouted something, and the security team pushed him to his knees. The biometric scan—

fingerprints, retina scan, fast-match DNA—took seconds while the man's arms were held out at his sides, his elbows bent back in restraint holds.

"I think maybe you used to have a deck," Timmy said. "I don't think you got one right now."

Erich stood unmoving, caught between the animal urge to flee and to protect himself by hiding the evidence. Timmy's thick fingers closed around his good shoulder. The big kid's expression was mildly concerned. "We don't go right now, they're gonna have you and it both. I sorta screwed up the last thing Burton told me to do. Let's not burn my second chance getting you caught."

This is a security alert. Remain where you are with your hands visible until security personnel clear you to leave.

Erich swallowed and nodded. It was the nearest he could come to speech. Timmy turned him toward the squat and pushed him forward.

In the streets, the security teams converged slowly, moving from person to person, door to door, floor to floor. Before the operation was through, they would identify three hundred forty-three people and detain four who appeared in the operational database as persons of interest. Three unregistered individuals would be identified, entered into the system, and held pending investigation. The two of the unregistered who refused to provide a name would have names assigned to them. The operation, covering three city blocks, would locate an unlicensed medical clinic, three children in distressed circumstances, seven pounds of S-class psychoactives, eighty-two instances of illegal occupation, and the network interface deck and data collection setup offered up by a blue-haired detainee in exchange for a reduced penalty. The process would take ten hours, and so it was still hardly under way when Timmy and Erich emerged from the undocumented access tunnel that connected the squat with an abandoned seawater pumping station. They walked together, Erich with his good hand stuffed deep in his pocket, Timmy with the same amiable air that was his default. Erich was weeping silently. Above them, the transport ship was gone, the golden exhaust plume now only a streak of smoke against the sky.

"I'm dead," Erich said. "Burton's going to fucking kill me. They got my deck. They got everything."

"Wait a minute," Timmy said. "*Everything* everything? Burton's stuff was on the—"

“No. I’m not stupid. I don’t store records of how I keep Burton clean. But I didn’t wash it down after the setup. I was going to do it after we were done. It’s going to have DNA on it. Shit, it may even have fingerprints. I don’t know.”

“So what if it does?” Timmy asked with a shrug. “You’re not in the system.”

“Not now,” Erich said. “But if they pick me up ever, for *anything*, it’s going to be with a little highlight alert linking back to that fucking deck. They’ll know what I do. And then they’ll know to ask.”

“You don’t gotta say anything,” Timmy said, his tone almost apologetic.

“I won’t get a chance. Burton finds out they’ve got my DNA, all he’s gonna see is a path back to him. I’m a loose end, man. I’m dead.”

All around the city, traps shut.

In the north, five dozen armored security personnel blocked intersections and shut down metro stations. The door-to-door search and control operation converged on a seven-story office building controlled by the Loca Griega. The local men and women took shelter where they could, hiding in bathtubs and basements and soot-caked hard-brick fireplaces. Things dense enough to hopefully block the infrared and backscatter and heartbeat sensors Star Helix carried. Network signals went dark. The Star Helix employees moved forward in tight formation, forced to use their eyes instead of their tech, the plates of armor on their chests and backs and bellies making them seem like vast beetles in the autumn sunlight. When the perimeter around the building was established, monitoring stations were constructed, watching the windows for the vibrations made by voices. A wave of dragonfly-small surveillance drones swept in, and for a moment it seemed like perhaps the violence wouldn’t come. And then, as one, the hundreds of small, cheap Star Helix robots fell to the ground, victims of Loca Griega countermeasures, and the building bloomed with gunfire. Seventeen Loca Griega died before the sun went down, including Eduard Hopkins and Jehona Dzurban, reputed to be the Earth-surface coordinators of the Belt-based syndicate. The plume of smoke that rose from the building darkened the air for hours and left the city air gray and hazy the next morning.

At the same time in the west, where the municipal limits gave way invisibly to the regional jurisdiction, a warehouse owned and operated

through a complex web of shell companies was locked down. The security teams emptied a three-block radius using a small fleet of armored buses and an operational procedure designed for response to sarin gas attacks. When the warehouse's perimeter was breached shortly before midnight, it contained ten thousand unrecorded assault rifles, half a million rounds of tracer-free ammunition, seventy cases of grenades, and a computer room ankle deep in melted slag. There was no evidence of anyone having been present in the warehouse, and no trail of ownership for any of it.

Checkpoints at the evacuated rail terminal, the spaceport, and the docks identified seventy people traveling on falsified accounts. All of them were independents or small fry in a larger organization. The security forces hadn't expected to catch anyone high on their priorities list in the first pass. The more powerful, better-connected targets were either smart enough not to travel during a crackdown or else had cleaned accounts to move under. Instead, the thought was that among the small-time thugs and operatives, there might be one or two desperate and foolish enough to provide them a lead to someone bigger. Someone worth having. And so without knowing who Burton was, what he looked like, his name or description or precise role in the criminal ecology of Baltimore, they were hunting him. And they were also hunting others, many of them much higher-priority than himself. Organizace Bayyo had a presence in the city, as did the Golden Bough. Tamara Sluydan controlled several blocks north of the arcology, and Baasen Tagniczen an area twice Burton's—though not so profitably run—in the Patapsco Valley Housing Complex. There was a great deal of crime, organized and otherwise, for the forces of law to concern themselves with, and no net was so strong or fine that nothing slipped through.

In times like these, when he couldn't know whether he had been compromised, Burton played it safe. He had half a dozen apartments and warehouses outfitted to act as temporary command centers, and he moved between them almost at random. Some of his people, he knew, would be caught up. Some of those who were would buy short-term leniency with the coin of information. He knew that would happen, and he had plans in place that would protect him from discovery, obscure his involvement in anything actionable, and punish brutally and irrevocably whoever had chosen to make that trade. It was understood that anyone captured would be wiser to trade their own underlings to the security forces than to sell out Burton. The

risk devolved on the little guy. Shit rolling downhill, as it had since the beginning of time. Which was, in part, why what happened to Liev was so unfortunate for everybody.

Liev Andropoulos had worked for Burton since coming to Baltimore from Paris more than twenty years before. He was a thickly built man, as round in the chest as the belly, and strong enough that he rarely had to prove it. His appetite for women occasioned jokes, though rarely the sort made in front of him, as did his habit of placing his long-term lovers in positions of comfort within his organization when he ended their relationships. As one of Burton's lieutenants, he oversaw three full-time whorehouses, a small network of drug dealers specializing in low-end narcotics and psychoactives, and an unlicensed medical facility that catered to the unregistered population. By custom, he worked from a small concrete building at the edge of the water, but when the churn began, he was leaving his lover's apartment on Pratt. The woman's name was Katie, and she had the olive skin and brown lips that Lydia had had twenty years before. Liev was a man of deep habits and consistent tastes. He kissed her goodbye for the last time on the street outside the apartment building, then walked away to the north while she went south. It was a perfunctory gesture, meaningful only in retrospect, as so many last kisses are.

The streets were crowded, the air muggy and close. The saltwater and rotting fish smells of the encroaching Atlantic were omnipresent, as they always were on hot days. Private transport wasn't allowed, and the lumbering buses moved like slow elephants in the press of midday bodies. A beggar plucked at Liev's sleeve and then backed away in fear when Liev turned to scowl at him. In the cacophony of the city, the whine of the flying drones should have been inaudible, but something caught Liev's attention, tightening the skin across the back of his wide neck. His footsteps faltered.

From above, the ripples in the crowd would have looked like the surface of still water disturbed by the convergence of half a dozen fish intent on the same fly. For Liev, it was only a sense of dread, a burst of useless adrenaline, and the offended shouts of the civilians pushed aside by the armored security men. As if by magic, a bubble of open space appeared around him. Liev could see clearly the scuffed and stained concrete on which he walked. The man in the Star Helix uniform before him held a pistol in both hands, the barrel fixed on Liev's chest. Center of mass. By the

books. Behind the helmet's clear face shield, the man looked to be somewhere in his middle twenties, focused and frightened. Liev felt a pang of amusement and regret. He held his arms out at his sides, cruciform, as five more security men boiled out of the gawking crowd.

"Liev Andropoulous!" the boy shouted. "You are under arrest for racketeering, slavery, and murder! You are not required to participate in questioning without the presence of an attorney or union representative!" Tiny flecks of spittle dotted the inside of the face shield. The boy's wide eyes were almost jittering with fear. Liev sighed.

"Ask me," he said slowly, enunciating very clearly, "if I understand."

"What?" the boy shouted.

"You've told me the charges and made the questioning statement. Now you have to ask me if I understand."

"Do you understand?" the boy barked, and Liev nodded.

"Good. Better," Liev said. "Now go fuck yourself."

The prisoner transport blatted its siren, shouldering its way through the crowd, but before it had crossed the distance to Liev, before he had been slotted into the steel cell and made secure, news of his capture was radiating out through the neighborhood. By the time the transport began moving again, making its way north toward the nearest tactical center, Burton had already seen a recording of the arrest. Katie, sitting at a noodle café with her little brother, got the news on her hand terminal and broke down weeping. Dread passed through the network of Liev's employees and underlings. Everyone knew what would happen next, and what would not. Liev would be taken to a holding cell, processed, and interrogated. If he kept quiet, he would be remanded to state custody, tried, and sent to a detention center, likely in North Africa or the west coast of Australia. More likely, he would cut a deal, parting out the network of crime he'd controlled bit by bit in exchange for clemency—the names and ID numbers of his pimps in order to serve his time in North America or Asia, the details of how he laundered the money for a private cell, which physicians had moonlighted in his clinic for library access.

They would ask him who he worked for, and he wouldn't say.

For Burton's other lieutenants, it complicated the future and simplified the present. One of their own was gone and unlikely to return. When the worst had passed and something like normalcy returned to Burton's little

kingdom, business that had been Liev's would be shared among them, granted to some newly promoted member of the criminal nobility, or a combination of the two. How exactly that played out would be the subject of weeks of negotiations and struggle, but later. Later. In the short term, all such agendas gave way to the more immediate problems of avoiding the security forces, protecting the assets they had, and making it very clear to everyone under them that selling out information for the favor of the court's mercy was a very, very bad idea.

In a basement lab at the corner of Lexington and Greene, eighty gallons of reagents used in alkaloid synthesis were poured into the water recycling stream. At the locally renowned Boyer Street house, two overly talkative prostitutes went quietly missing and the doors were locked. The body of Mikel "Batman" Chanduri was discovered in his two-room apartment at sundown, and though it was clear his death had been both violent and protracted, none of his neighbors had anything to report to the security men who'd come to interview him. Before the sun had set, Burton's lieutenants—Cyrano, Oestra, Simonson, Little Cole, and the Ragman—went to ground like foxes, ready to wait out the worst of the crackdown, each hoping that they would not be another gap in the organization like Liev, and each hoping that the others—not all, of course, but a few—would. One or two, perhaps even three, harbored some plots of their own, ways to see that their rivals within Burton's organization fell prey to the dangers of the churn. But they didn't speak of them to anyone they didn't trust with their lives.

And in an unlicensed rooftop coffee bar that looked down over the human-packed streets, Erich hunched over a gray-market network deck the owner had bolted to the table. He was trying to keep his panic from showing, wondering if Burton had heard about the capture of his deck, and hoping that wherever Timmy had rushed off to when they'd heard of Liev's arrest, he'd get back soon. The coffee was black and bitter, and Erich couldn't tell if the coppery flavor was a problem with the beans or the lingering taste of fear. He sat on his newsfeed, set to passive for fear that his search requests would be traced, and watched as all around him more traps snapped shut, his gut knotting tighter with every one.

When Lydia heard what had happened to Liev, her first action was to put on her makeup and style her long, gray-streaked hair. She sat at the mirror in her bedroom and rubbed on the flesh-toned base until the lines in her skin

were gone. She painted her lips fuller and darker and redder than they had ever been in nature. The black eyeliner, reddish eyeshadow, rust-colored blush. Despite the danger she was in, she didn't hurry. A lifetime of experience had drawn connections in her mind that linked sexual desirability, fear, and fatalism in ways she would have recognized as unhealthy if she'd seen them in someone else. She pulled her hair around, piling it high and pinning it in place until it cascaded, three-quarters contained, to her shoulders in the style Liev had enjoyed back when he had lifted her up from the working population of the house and made her his own. She thought of it as a last act of fidelity, like dressing a corpse.

She shrugged out of her robe and pulled on simple, functional clothes. Running shoes. Her go-bag was a nondescript blue backpack with a three-month supply of her medications, two changes of clothes, four protein bars, a pistol, two boxes of ammunition, a bottle of water, and three thousand dollars spread across half a dozen credit chips. She pulled it down from the top of her closet, and without opening it to check its contents, went to the chair by her front window. The curtains were pale gauze that scattered and softened the afternoon light, graying everything. She pulled a sheer yellow scarf over her hair, swathed her neck, and tied it at her sternum, the ironic echo of her old hijab. Then sat very still, feet side by side, ankles and knees touching. Primly, she thought. She waited in silence to see who would open her door, a security team or Timmy. The darkness, or else the light.

The better part of an hour passed. Her spine hurt, and she savored the pain, keeping her face placid. Smiles or grimaces, either one would disturb her makeup. Then footsteps in the hall, like someone clearing their throat. The door opened, and Timmy stepped in. His gaze flicked down to her back, up to her face. He shrugged and nodded to the hall in a gesture that said, *Can we go?* as clearly as words. Lydia stood, pulled on her pack as she walked to the door, and left her room for the last time. She had lived there for the better part of a decade. The necklace that Liev had given her the night he'd told her he was moving on, but that she would be cared for, hung from a peg in the bathroom. The cheap earthenware cup that Timmy had painted with glaze when he was eight years old and given her for what he'd mistakenly thought was her birthday remained in the cupboard. The half-finished knitting that an old roommate had left when she disappeared twenty years before sat hunched in a plastic bag under the bed, stinking of

dust.

Lydia didn't look back.

"My spirit animal is the snake," she said as they walked south together. They went side by side, but not touching. "I shed my skin. I just let it slough away."

"Okay," Timmy said. "Come on this way. I got a thing waiting."

The waterline was cleanest near the new port. There, the ships and houseboats rested in clean slips made of flexible ceramic and the bones of the drowned buildings had been cut free and hauled away. With every mile farther from the port, the debris grew less picturesque, the charm of the reclaimed city giving way to the debris of its authentic past. Little beaches formed over asphalt, gray sand swirling around old blocky concrete pillars standing in the waves green with algae and white with bird shit. The stink of rot came from the soupy water and the corpses of jellyfish melting where the tide had left them.

Timmy's boat was small. White paint flaked off the metal where it hadn't been scraped well enough before being repainted. Lydia sat in the bow, her legs folded under her, her chin high and proud. The motor was an under-the-waterline pulse drive, quiet as a hum. The water in their wake was louder. The sun was near to setting, the city casting its shadow on the waves. A handful of other boats were on the water, manned by children for the most part. The citizens of basic with nothing better to do with their time than spend the twilight on the water, then go home.

Timmy ran them along the coast for a time, and then turned east, out toward the vast ocean. The moon had set, but the lights of the city were bright enough to travel by. The islands had once been part of the city itself, and now were ruins. Timmy aimed for one of the smaller, a stretch not more than two city blocks long by three wide humped up out of the water. A few ancient walls still stood. The boat ran up onto the hard shore, and Timmy jumped out, soaking his pants to the thighs, to pull it the rest of the way up. The metal screeched against the rotting concrete sidewalk.

The ruin he led her to was little more than a camp site. A bright yellow emergency-preparedness sleeping bag lay unrolled on a foam mattress. An LED lamp squatted beside it with a cord snaking up the grimy wall to a solar collector in the window. A small chemical camping stove stood on a driftwood board placed over two cinderblocks, a little unpowered

refrigerator beside it to store food. Two more rooms stood empty through the doorway. If the house had ever had a kitchen or a bathroom, it was lost in the tumble of rubble beyond that. Outside, the city glowed, the violence and bustle made calm and beautiful by even such a small distance. The wail of the sirens and angry blat of the security alerts became a kind of music there, transformed by the mystical act of passing above waves.

Timmy pulled off his water-soaked pants and dug a fresh pair out from under the sleeping bag.

“This is where you go?” Lydia said, putting her hand on the time-pocked window glass. “When you aren’t with me, you come to this?”

“Nobody bugs you here,” Timmy said. “Or, you know. Not twice.”

She nodded, as much to herself as for his benefit. Timmy looked around the room and rubbed his hand across his high forehead.

“It’s not as nice as your place,” he said. “But it’s safe. Temporary.”

“Yes,” she said. “Temporary.”

“Even if Liev does tell ’em about you, it’s not like it’s over. You can get a new name. New paper.”

Lydia turned her gaze back from the city, her right hand going to her left arm as if she were protecting herself. Her gaze darted to the empty doorway, and then back. “Where’s Erich?”

“Yeah, the meet didn’t happen,” Timmy said, leaning against the wall. She never ceased to be amazed by his physicality. The innocence and vulnerability that his body managed to project while still being an instrument of violence.

“Tell me,” she said, and he did. All of it, slowly and carefully, as if worried he might leave something out that she wanted to know. That she found interesting. The low rumble of a launch shuddered like an endless peal of thunder, and the exhaust plume rose into the night sky as he spoke. It had not yet broken into orbit when he stopped.

“And where is he now?” she asked.

“There’s a coffee bar. The one at Franklin and St. Paul? On top of the old high-rises there. I got him there when it was done. They’ve got a deck there you can rent by the minute, and since his got taken, I figured he’d like that. Gotta say, he was pretty freaked out. That DNA thing? I don’t see how that’s gonna end well. If he’s right about how Burton’s gonna react...”

Lydia shook her head once, a tiny gesture, almost invisible by the light

of the single LED lamp. “I thought you were his bodyguard. You were assigned to protect him.”

“I did,” Timmy said. “But then the job was done. Burton didn’t tell me I was supposed to go to the bathroom with him for the rest of his life, right? Job was done, so the job was done.”

“I thought you were his friend.”

“I am,” Timmy said. “But, y’know. *You*.”

“Don’t worry about me. Whatever comes to me, I have earned it a thousand times over. Don’t disagree with me! Don’t interrupt. Burton asked you to protect Erich because Erich is precious to him. The particular job he assigned you may be over, but worse has come to the city, and Erich is still precious.”

“And I get that,” Timmy said. “Only when they got Liev—”

“I have lived through the churn before, darling boy. I know how this goes.” She turned to the window, gesturing at the golden lights of the city. “Liev was only one. There will be others. Perhaps many, perhaps few, but Burton will lose some part of his structure to the security forces or to death. And the ones who remain afterward will become more important to him. He is a man who values survivors. Who values loyalty. What will he think, dear, when he hears that you left Erich to come spirit me away?”

“Job was done,” Timmy said, a little petulantly she thought.

“Not good enough,” she said. “Not anymore. You aren’t the boy Erich drinks with anymore. You aren’t even your mother’s son now. Those versions of you are gone, and they will never come back. You are the man who took a job from Burton.”

Timmy was silent. Far above them, the transport’s exhaust plume went dark. Lydia stepped close to him and put her hands on his shoulders. He wouldn’t meet her eyes. She thought that was a good sign. That it meant she was getting through to him.

“The world changes you and you can’t stop it from doing so. You have to let go of being someone who doesn’t matter now. Because if you live through this time—just live through it and nothing more—you will be more important to Burton. You can’t avoid it. You can only choose what your importance is. Will you be someone he can rely upon, or someone he can’t?”

Timmy took a deep breath in through his nose and sighed it out. His eyes

were flat and hard. "I think I maybe fucked up again."

"Only maybe," Lydia said. "There still may be time to repair the error, yes? Go find your friend. You can bring him here."

Timmy's head jerked up. Lydia rubbed his shoulders gently, beginning at the base of his neck and stroking out to the bulges of muscle where his arms began, then back again. It was a gesture she had made with him since he was a child, a physical idiom in their own private language. Her heart ached at the sacrifice she was making. *The world changes you*, she thought. Hadn't she just said that?

"Bring him here? Y'sure about that?"

"It's all right," she said. "It's temporary."

"Okay then," he said. She felt a tug of regret that he had given in so quickly, but it passed quickly. "I'll leave you the good boat."

"The good boat?" she said to his retreating back.

"The one we came in."

The door closed. The gray that passed for darkness swallowed him up, and five minutes later she heard what might have been a skiff splashing in among the waves. Or it might only have been her imagination. She pulled herself into the warm, stinking, plastic embrace of the sleeping bag and stared at the ceiling and waited to see whether he returned.

* * *

All through Baltimore, the struggle between law and opportunity continued, but most of the citizens allied themselves with neither side. The unlicensed coffee shop filled with customers looking for a cheap way to make their dinners on basic seem more palatable, and then with younger people who either didn't have the currency or else the inclination to take amphetamines before descending to the one-night rai clubs on barricaded streets. A few parents came home from actual jobs, proud to spend real money for a stale muffin and give their credits to the gray-market daycares run out of neighborhood living rooms. Very few people stood wholly for the law or wholly against it, and so for them the catastrophe of the churn was an annoyance to be avoided or endured or else a titillation on the newsfeeds. That it was a question of life and death for other people spoke in its favor as entertainment.

Erich, sitting at the rented deck with a newsfeed spooling past, felt the distance between himself and the others who shared his space more keenly than they did. His sense of dread, of a chapter of his own life ending, was unnoticed by the heavysset woman who brewed the coffee and the thin man at the edge of the rooftop who spent his hours sending messages about tangled romantic involvements. To the other habitués of the coffee shop, Erich was just the crippled man who was hogging the deck. An annoyance and an amusement, and no one would particularly notice or care if he vanished from the world.

Timmy arrived just after midnight, his broad, amiable smile softening the distance in his eyes. To anyone who didn't look at him closely, he seemed unthreatening, and no one looked at him closely. He pulled a welded steel chair up to the bolted-down deck and sat at Erich's side. The newsfeed was set to local. A pale-skinned woman with the Outer Planets Association split circle tattooed on her sternum and Loca Griega teardrops on her cheeks had blood pouring from her nose and left eye while she struggled against two Star Helix enforcers in gear so thick they barely seemed human. Erich smiled, trying to hide the relief he felt at Timmy's return.

"Loca," Erich said, nodding at the feed. "They're having a bad night too."

"Lot of that going around," Timmy said.

"Yeah, right? You...heard from Burton?"

"No. Didn't try to find him yet either," Timmy said with a shrug. "You want to hang out here some more, or you about ready to go?"

"I don't know where to go," Erich said, a high violin whine coming in at the back of his voice.

"I got that covered," Timmy said.

"You got a bolt-hole? Jesus, that's where you've been all this time, isn't it? Getting someplace safe to hide?"

"Kind of. But, you know, you ready?"

"I need to stop someplace. Get a deck."

Timmy frowned and nodded at the table before them. *There's one right there* was in his eyes. Erich pointed at the bolts anchoring the machine to the wooden tabletop. Timmy's expression went empty and he stood up.

"Hey," Erich said. "What're you...Timmy? What are you—"

The thick woman who brewed the coffee looked up at the broad-shouldered young man. The coffee bar had been hers for three years, and she'd seen enough of the regulars to recognize trouble.

"Hey," the large man—boy, really—said, his voice making the word half apology. "So look. I don't mean to be a dick or anything, but I kind of need that deck."

"You can use it here, you buy some coffee. Or rates are printed on the side," the woman said, crossing her arms.

The big kid nodded, his brow knotting. He took a scuffed and stained black-market credit chip and pressed it into her palm.

"Shit, Jones," she said, blinking at the credit balance on the tiny LED display. "How much coffee you want?"

The kid had already turned back to the table where the cripple with the baby arm had been sitting all day. He hit the table with his fist hard enough that everyone on the rooftop turned to look at him. After the third hit, the wood of the tabletop started to splinter. There was blood on the big boy's knuckles, and the cripple was shifting back and forth anxiously as the table fell to sticks and splinters. The boy pulled her little deck free with a creaking sound. The bolts still hung from it, the wood torn out from around them. Blood dripped from his hands as he tucked the machine under his arm and nodded to the cripple.

"Anything else you need?" Timmy asked.

Erich had to fight not to smile. "No, I think I'm good now."

"All right then. We should go." Timmy turned to the woman and lifted his swelling hand to her in a wave. "Thanks."

She didn't say anything, but pushed the credit stick into her apron and waddled back to get a broom. They were gone before she returned, walking down the stairway to the street.

"That was incredible," Erich said. "The way you did that? I mean, damn it. Everyone in there was cold as stone, and you were just madness and power, man. Did you see that? Did you see how gassed they were at you?"

"You said you needed the deck," Timmy said.

"Come on! That was critical. You can brag about it some."

"Tables don't fight back," Timmy said. "Come on. I got a boat."

Erich's relief left him chatty, but he didn't talk about the fear he'd felt when Timmy had left him. Instead, he filled the trip with everything he'd

seen on the feeds, and he told it all like he was telling ghost stories. The security forces were watching the ports, the trains, the transports up to the orbitals and Luna. Eighteen dead today, maybe three times that many in custody. It was news all over the world, and farther. There had even been a lady from Mars who'd come on for a while talking about the history of Earth-based police states. Wasn't that cool? All the way to Mars, they were talking about what was going on right then in Baltimore. They were everywhere.

Timmy listened, adding in a few words here and there, but mostly he walked until they reached the water, and then he rowed. The ceramic oars dipped into the dark water and lifted out again. Erich drummed his fingertips against the stolen deck, anxious to reconnect it to the network, so see what was happening and what had changed in the time since they'd left the coffee bar. That being connected would somehow protect him was an illusion, and Erich half knew that. But only half.

At the little island, Timmy pulled the boat onto shore and marched into the ruins where a light was burning. An old woman was sitting beside a chemical stove, stirring a small tin pot. The smell of brewing tea competed with the brine and the reek of decaying jellyfish. She looked up. Her face was like a mask, the makeup applied so perfectly it shoved her back into the uncanny valley.

"I found your tea," she said. "I hope you don't mind."

"Nope," Timmy said, not breaking stride. "Come on, Erich. I'll get you set up."

They walked through a doorway without a door and into a small room. It was even less comfortable than the one with the old lady. There was nothing on the floor but the glue marks where there had once been carpeting. Mold grew up along one wall, black and branching like tree limbs. Timmy put the deck on the ground. His knuckles were black with blood and forming scab.

"You be able to get signal here?" Timmy asked.

"Should be. May need to find a way to power up in the morning."

"Yeah, well. We'll come up with something. So this is your room, okay? Yours. That one's hers," Timmy said, pointing a thumb at the lighted doorway. "Hers. She asks you in, you can go in, but she asks you to leave, you do it, right?"

“Of course. Sure. Christ, Timmy. Your place, your rules, right?” Erich smiled, hoping to coax one in response. “We’ve always respected each other, right? Only, seriously, who is she? Is that your mom?”

It was like Timmy hadn’t heard him. “I’m gonna get some sleep, but come morning, I can go back in, get some food. And I’ll check in with the man.”

Erich felt his belly go cold. “You’re going to talk to Burton?”

“Sure, if I can find him,” Timmy said. “He’s got the plan, right?”

“Right,” Erich said. “Of course.”

He opened the deck, ran it through its startup options, and connected to the network. The signal strength wasn’t great, but it wasn’t awful. he’d been in half a dozen basement hack shacks with worse. He opened the newsfeed, still set to passive. The glow from the screen was the only light. Erich was cold, but he didn’t complain. Timmy stood, stretched, considered the skinned knuckles of his hand with what could have been a distant sort of ruefulness, and turned to go back to the old woman and the light.

“Hey, we’re friends, right?” Erich said.

Timmy turned back. “Sure.”

“We’ve always watched out for each other, you and me.”

Timmy shrugged. “Not *always*, but when we could, sure.”

“Don’t tell him where I am, okay?”

* * *

Security crackdowns, like plagues, had a natural progression. A peak, and then decline. As terrible as they might be at their height, they did not last forever. Burton knew this, as did all of his lieutenants, and he made his plans accordingly. Burton moved through his safe houses, playing shell games with the security forces. The first night, while Erich and Lydia slept in their respective rooms in the little island ruin and Timmy tried to find someone in the organization to report to, Burton slept in a loft above a warehouse with a woman named Edie. In the morning, he moved to the storage in the back of a medical clinic, locking the door and hijacking an untraceable connection so that he could speak to his people with relative safety. Little Cole had closed down her houses, locked away her reports, buried a month’s supply of drugs, and taken a bus to Vermont to stay with

her mother until things died down. Oestra was still in the city, moving from place to place in much the same fashion that Burton was. Ragman and Cyrano were missing, but it was early enough that Burton wasn't concerned yet. At least they weren't in the newsfeeds. Liev and Simonson were.

And there was other evidence, indirect but convincing, of where the little war stood. Even in the first morning after the catastrophe began, security teams were calling on Liev's underlings, sweeping them up for questioning. Some, they held. Others, they released. Burton had no way of knowing which of those who had been set free had cut deals with security and which had been lucky enough to slip through the net. It hardly mattered. That branch of the business had been compromised, and so it would die. The demand for illicit drugs, cheap goods, off-schedule medical procedures, and anonymous sex could be neither arrested nor sated, and so the thing that mattered most for Burton's little empire was safe. Would always be safe. The question of how to feed the city's subterranean hungers was only a tactical one, and Burton could be flexible.

The temptation, of course, was to fight back, and in the following days, some did. Five soldiers from the Loca Griega left a bomb outside a Star Helix substation. It exploded, injuring two of the security contractors and damaging the building, and all five bombers were identified and taken into custody. Tamara Sluydan, who really should have known better, organized street-level resistance, starting a two-day riot that ended with half of her people hospitalized or in custody, eighteen local businesses looted or set afire, and the goodwill of her client base permanently damaged. Burton understood. He wasn't a man without passions. If someone hurt him, of course he wanted to hurt them back. Phrases like "even the score" or "blood for blood" came to mind, and each time they did, he made the practice of tearing them apart to himself. "Even the score" was the metaphor of a game, and this wasn't a game. "Blood for blood" made it sound as if through more violence, past wrongs could be balanced, and they couldn't. The hardest lesson Burton had ever learned was to endure the blows, accept the damage, and let someone else strike back. Soon, very soon, the crackdown would shift from its great, overwhelming force to individual struggles. It was in his interests to see that those struggles were with the Loca Griega and Tamara Sluydan, not with him. As soon as the enemy was clearly defined in the collective mind of Star Helix and Burton's name and

organization were not central to their plans, the storm would move on and he could begin to reopen the folded fronds of his business.

In the meantime, he moved from one place to the next. He told people he would go one place, and then arrived at another. He considered all his habits with the uncompromising eye of a predator, and killed the ones with flaws. Anything that connected him with the patterns of the past was a vulnerability, and wherever possible, he chose to be invulnerable. It wasn't the first time he'd been through this. He was good at it.

And so when it took Timmy the better part of a week to find him, Burton's annoyance was balanced against a certain self-centered pride.

The office was raw brick and mortar, newsfeeds playing on five different screens. A sliding wooden door stood half open, the futon where Burton had slept the the night before half visible through it. Oestra, whose safe house it was, sat by the window looking down at the street. The automatic shotgun across his legs seemed unremarkable. Timmy had been searched by three guards on the street, and he'd been clean. Even if he'd swallowed a tracking device they would have found it, and the big slab of human meat would have been bleeding out in a gutter instead of smiling amiably and gawking at the exposed ductwork.

"Timmy, right?" Burton said, pretending uncertainty. Let the boy feel lucky he'd remembered that much.

"Yeah, chief. That's me." The openness and amiability was annoying. Burton glanced toward Oestra, but the lieutenant was squinting at the brightness of the day. Burton scratched his leg idly, his fingernails hissing against the fabric of his pants.

"You got something for me?"

Timmy's face fell a little. "Just news. I mean, I didn't have any stuff. Nothing to deliver or anything."

"All right, then," Burton said. "What's the news, Tiny?"

Timmy grinned at the irony of the nickname, then sobered and began his report. Burton leaned forward, drinking in all the words as fast as they spilled from Timmy's lips. When Oestra risked a glance back, it was like watching a bird singing away while a cat stood in the too-still pose of a carnivore waiting to pounce. The details came out in no particular order: Erich was in a safe place, Timmy had been taking food to him, the fake profile deal had been interrupted by the security crackdown, Erich's original

deck was gone but he had a replacement, the police probably had his DNA profile now. Oestra sighed to himself and looked back out the window. On the street, a half dozen young men who hadn't just condemned their friends to death slouched down the street together.

"He's sure about that?" Burton asked.

"Nah," Timmy said. "We didn't hang around and watch them find the deck or anything. I figured it'd be better, you know. To get out."

"I see."

"Erich wanted to go get it. Grab the hardware, I mean."

"That would have been a mistake," Burton said. "If security had the deck and the man, that...well, that'd be bad."

"Was what I thought too," Timmy said.

Burton sat back, the leather of the chair creaking. Back past the bedroom, Sylvia started running the shower. Sylvia or Sarah. Something like that. One of Oestra's, provided with the bed. "Where's the safe house?"

"I'm not supposed to say," Timmy said.

"Not even to me?"

The boy had the good sense to look uncomfortable. "Yeah, not to anyone. You know how it is."

"Is there anyone there with him?"

"Yeah, I got a friend there."

"A guard?"

"Not really, no. Just a friend."

Burton nodded, thinking hard. "But he's secure?"

"He's on the water. Anyone starts coming in, he's got a boat and about a dozen decent places to hide. I mean, nowhere's a hundred percent."

"And you're protecting him."

"That's the job," Timmy said, with a shrug and a smile. Burton couldn't quite put his finger on what it was about the boy that was so interesting. Over the years, he'd had hundreds just like him who came through, worked, disappeared, died, were fed to security or found God and a ticket out of town. Burton had a nose for talent, though, and there was something about this one that kept bringing him back to the sense of the boy's potential. Perhaps it was the casual logic he'd used when he'd killed Austin. Maybe it was the deadness in his eyes.

Burton got up, raising a finger. Timmy sat deep in his chair like a trained

dog receiving a command. Sylvia—whoever—was singing in the bathroom. The splash of water against porcelain covered the sound of Burton opening the gun safe, pulling out the pistol and its magazine. When he stepped back into the main room, Timmy hadn't so much as crossed his legs. Burton held the gun out.

"You know what this is?" he asked.

"It's a ten-millimeter semi-auto," Timmy said. He put his hand out halfway to it, and then looked up at Burton, his eyes asking permission. Burton nodded and smiled. Timmy took the gun.

"You know guns?"

Timmy shrugged. "They're around. It feels...sticky."

"It's got a resin of digestive enzymes," Burton said. "Won't hurt your skin much, but it won't hold prints and it breaks down any trace evidence. No DNA."

"That's cool," Timmy said, and started to hand it back. Burton tossed the magazine onto the boy's lap.

"Those are plastic-tipped. Organ shredders, but they don't work on armor," Burton said. "Still, step up from that homemade shotgun you've used, right?"

"Right."

"You know how those things all go together?"

Timmy weighed the pistol in one hand, the magazine in the other. He slid them together, checked the chamber, flicked the safety on and off. It wasn't the practiced action of a professional, but talented amateur was good enough for his purposes. Timmy looked up, his smile blank and empty. "New job?" he asked.

"New job," Burton said. "I know you and Erich grew up together. Is this going to be a problem for you?"

"Nope," Timmy said, slipping the gun into his pocket. There hadn't even been a pause.

"You're sure?"

"Sure, I'm sure. I get it. They've got him in the system now. If they get him too, there's all kinds of things he compromises. If they can't get him, nothing gets compromised, and I'm the only guy who can get close to him without him seeing it coming."

"Yes."

“So I kill him for you,” Timmy said. He could have been saying, *So I’ll pick up dinner on my way*. There was no bravado in it. Burton sat, tilted his head. The friendly smile and the empty eyes met him.

“All right, I’m curious,” Burton said. “Did you game this? This was your plan?”

“Shit no, chief,” Timmy said. “This here’s just happy coincidence.”

Either it was truth or the best deadpan Burton had seen in a long time. The shower water turned off. On the newsfeeds, a woman in a Star Helix uniform was saying something, a dour expression on her face. Burton wanted to turn up the volume, see if the press statement was something useful to him like reading fortunes in coffee grounds. He restrained himself.

“I will need proof,” Burton said. “Evidence, yeah?”

“So what, you want his heart?”

“Heart. Brain. Windpipe. Anything he can’t live without.”

“Not a problem,” Timmy said. Then a moment later, “Is there anything else, or should I go?”

“You watched out for this kid your whole life,” Burton said. “He vouched for you. Got you in with me. And you’re really going to put a slug in his brain just like that?”

“Sure. You’re the man with the plan.”

When the boy left, Burton came to stand beside Oestra, watching him walk away down the sunlit street. The thinning reddish-brown hair and wide shoulders made him look like some kind of manual laborer twice his age. His hands were shoved deep in his pockets. He could have been anybody.

“Think he’ll do it?” Burton asked.

Oestra didn’t answer for a long moment. “Might.”

“He does this for me, he’ll do anything,” Burton said, clapping Oestra’s shoulder. “Potential for a man like that.”

“If he doesn’t?”

“There are a lot of ways to dispose of someone disposable,” Burton said.

Burton walked back to the chair, shifted the newsfeed buffer back to the start of the Star Helix woman’s press announcement. The woman started talking, and Burton listened.

Timmy’s ruin had long since become a misery for Lydia, and misery had become a kind of pleasure. Their days had taken a kind of rhythm. Erich

woke first in the morning, his uneven footsteps playing a tentative counterpoint to the rough sound of the waves. Lydia lay in the warmth of her cocoon, the slick fabric wrapped around her until only her mouth and nose were in the free air. When she could no longer pretend sleep, she emerged and made tea on the little stove, and when she was done, Erich transferred the solar charger to his deck and squatted over it, scanning the newsfeeds with a ferocity and single-mindedness that made her think of a poet chasing the perfect rhyme. If Timmy was there, she would walk with him to the boats or survey the newest supplies he had smuggled to their private island: fresh clothes, carryout tandoori, charged batteries for the deck and the lamp. More often, he was not there, and she haunted the shore like a sea widow. The city glowered out at her from across the water, like a great angry gray face, condemning her for her sins.

Is this the time? she would wonder. *Has he left now, never to return? Or will there be one more? Another time to see his face, to hear his voice, to have the conversations that we can only ever have with each other?*

She knew that the churn was playing itself out there, across the narrow waves. Security had likely come to her rooms on Liev's word and found them already abandoned. The men and women she'd worked with these last years were part of the past now. Part of a life she'd left behind, though nothing else had begun. Only this island exile and its waiting.

At night, Erich would eat with her. Their conversations were awkward. She knew that she was uncanny to him, that he thought of Timmy as his own friend, a character from his own past. Her appearance and the reticence she and Timmy had to making her explicable were as odd to Erich as if lobsters had crawled up out of the sea and started speaking Spanish. And yet if they did, what could anyone do but answer them, and so Erich and Lydia reached the odd peace of roommates, intimate in all things and nothing.

That night, Timmy crossed the waves unnoticed by her or Erich. Lydia was looking east over the ruined island to the greater sea beyond. Erich curled in the room that common habit designated as his, snoring slightly as the deck ran down its charge to nothing beside him. Timmy arrived quietly and alone, announced only by his footsteps and the smell of fresh ginger.

When he emerged from the darkness, two thin plastic sacks hung from his left fist. Lydia shifted, not rising, but coming up to rest on her knees and

ankles in a posture she imagined to be like a geisha, though she'd never met a real geisha. Timmy put the sacks down beside her, his eyes on the shadows past the doorway. Far away across the water, gulls complained.

"Two?" she said.

"Hmm?" Timmy followed her gaze to the sacks. A glimmer of something that might have been chagrin passed through his eyes fast as a blink. "Oh. The dinners. Hey, is Erich back there?"

"He is," Lydia said. "I think he's asleep."

"Yeah," Timmy said, straightening. He put a hand into his pocket. "Hang on a minute." He walked back toward the black doorway as if he were going to check on the other boy, perhaps wake him for his supper.

"Wait," Lydia said as Timmy reached the doorway.

He looked back at her, twisting at the shoulders, his body and feet still committed.

"Come sit with me."

"Yeah, I just gotta—"

"First," she said. "Come sit with me first."

Timmy hesitated, fluttering like a feather caught between contradictory breezes. Then his shoulders sank a centimeter and his hips turned toward her. He pulled his hand from his pocket. Lydia opened the sacks, unpacked the food, laid the disposable forks beside the plates. Every movement had the precision and beauty of ritual. Timmy sat facing her, his legs crossed. The bulge of the gun stood out from his thigh like a fist. Lydia bowed her head, as if in prayer. Timmy took up his fork and stabbed at the ginger beef. Lydia did the same.

"So you're going to kill him?" Lydia asked, her voice light.

"Yeah," Timmy said. "I mean, I ain't happy about it, but it's what needs to get done."

"Needs," Lydia said, her intonation in the perfect balance point between statement and question.

Timmy ate another bite. "I'm the guy that took a job from Burton. Used to be the job was one thing. Now it's something else. It's not like I get to tell him what to do, right?"

"Because he's Burton."

"And I'm not. You were the one who said I'd be important to him if I made it through this shitstorm. This is part of that."

“I said Burton would see you as important,” Lydia said. “There is more to you than what he sees. There’s more to you than what anybody sees.”

“Well,” Timmy said. “You.”

Even I do not know your depths floated at the back of her throat like a cough. She didn’t have it in her to say the words. If it was true, so what? When had truth ever been her friend? Instead she took another bite of the beef. He did the same. She imagined that he was giving her the time to gather herself. It might even have been true. The perfectly straight lightning bolt of a railgun transport lit the black sky, its thunder rolling after it like a wave. The ginger and pepper burned her lips, her throat, her tongue, and she took another bite, welcoming the pain. It was always pleasant when pain was on the outside.

“And who will you be to yourself?” she said at last. “Doesn’t what you think matter more than what he does?”

Timmy’s brow furrowed. “Yeah, I don’t know what you just said.”

“Who are you going to be to yourself, if you do this?” She put down her fork, leaned across the space between them. She lifted his shirt as she had countless times before, and the erotic charge of it was still there. Never absent. She pressed her palm against his breast, her skin against his skin in the place above his heart. “Who will you be in there?”

Timmy’s face went perfectly still in the unnerving way it sometimes did. His eyes were flat as a shark’s, his mouth like a plaster cast mold of himself. Only his voice was the same, bright and amiable.

“You know there ain’t no one in there,” he said.

She let her fingertips stray to the side, brushing through the coarse hair she knew so well. She felt the hardness of his nipple against her thumb. “Then who will you put there? Burton?”

“He’s the guy with the power,” Timmy said.

“Not the power to kill Erich,” she said. “Not the power to make *you* kill him. That is you and only you. People like us? We aren’t righteous. But we can pretend to be, if we want, and that’s almost the same as if it were true.”

“I get the feeling you’re asking me for something. I don’t know what it is.”

“I am not a good person,” she said.

“Hey. Don’t—”

“If I were, though? If I *were* that woman? What would I want you to

do?”

Timmy took another mouthful of beef, his jaw working slowly. In his concentration, she saw the echoes of all the versions of himself that she had known from baby to toddler to young man to this, now before her. She folded her hands on her lap.

“That’s a long way to say I shouldn’t do it,” he said.

“Is that what I said?” she asked.

Erich’s yawn came from the doorway. Lydia felt the blood rush from her face, tasted the penny-bright flush of fear as if she had been caught doing something illicit. Erich came into the light, scratching his sleep-tousled hair with his good hand. “Hey,” he said. “Did I hear you get back, big guy? What’s the word?”

Timmy was quiet, his gaze fixed on Lydia, his expression empty as a mask.

“Guys?” Erich said, limping forward. “What’s the matter? Is something wrong?”

Timmy’s sigh was so low that Lydia barely heard it. The boy she had loved for so long, and in so many ways, put on his cheerful smile and looked away from her. She felt tears pricking her eyes.

“Yeah, bad news,” Timmy said. “Burton’s not taking the whole thing very well. He’s put out paper on you.”

Erich sat down, the blood draining from his face. He grabbed his bad arm reflexively, unaware that he was doing it, and looked from Timmy to the woman and back. His heart thudded like a drum in his ears. Timmy licked his fork clean and put it down. The woman was still as stone. Erich felt his world fall out from underneath him, and that he had known it would be less of a comfort than he’d expected. Anyone looking in at the little circle of light from the shadows would have seen only three faces in the black, like a family portrait of refugees. Erich broke the silence.

“Are you *sure*?”

“Yeah, pretty sure,” Timmy said. “Seeing as how I got the contract.”

Erich stopped breathing. Timmy stared at him, expressionless for several infinitely long seconds.

“We’ve gotta find a way to get you out,” his big friend finally said, and Erich started breathing again.

“There’s no way out,” he said. “Burton’ll track me down anywhere.”

“What about that deck?” Timmy asked. “It ain’t your old one, but can you still sample with it?”

“What do you mean?” Erich said.

“You’ve got the escape plan for Burton. The clean one. Why don’t you put your sequence on it? Use it to get out of here?”

“I can, sure, but they’ve already got my *other* deck, remember? I put my DNA on a record, the flag goes up, and I’m in for questioning.”

“Yeah,” Timmy said. “Well maybe you could...Shit. I don’t know. Maybe you could think of something.”

“I knew,” Erich said. “The second I saw those bastards coming down the street, I knew it was over for me. I’m dead. It’s just a matter of time is all.”

“That’s always true,” Lydia said, her mind taken with other matters. “For everyone.”

“Might as well be you,” Erich said to Timmy, giving his friend permission. Terror and love warring in his chest.

“Nope,” Timmy said, cocking his head to one side as if he’d only just made the decision in that moment.

“Erich,” Lydia started.

“As long as I’m alive,” Erich said, ignoring her, “Burton’s not safe. He’s not going to let me slide.”

Timmy frowned, then grunted in surprise. Maybe pleasure.

“What?” Erich said.

“Just that it works the other way too,” Timmy said, levering himself up to his feet. “Anyway, I gotta go back in.”

“Back in?” Erich said.

Timmy brushed his hands across his wide thighs. “The city. I gotta go back to the city. Burton’s expecting me.”

“You’re not going to tell him where I am, are you?” Erich asked. Timmy started laughing and Lydia took it up. Erich looked from one to the other, confused.

“Nah, I’m not going to tell him where you are. I got something of his I need to give back is all. Nothing you have to worry about.”

“Easy for you to say,” Erich said, ashamed of the whine in his voice.

“I’ll leave you the good boat,” Timmy said, turning toward the darkness.

“Will you be back?” Lydia said. She hadn’t meant to, because she knew in her heart, in her bones, and deeper than that what the answer was. Timmy

smiled at her for the last time. *I take it back*, she thought. *Kill him. Kill the boy. Kill everyone else in the world. Shoot babies in the head and dance on their bodies. Any atrocity, any evil, is justified if it keeps you from leaving me.*

“Eh,” Timmy said. “You never know.”

The darkness folded around him as he walked away. Her hands were made of lead and tungsten. Her belly felt hurt and empty as a miscarriage. And underneath the hurt and the horror, the betrayal and the pleasure she took in her distress, something else stirred and lifted its head. It took her time to recognize it as pride, and even then she couldn’t have said who or what she was proud of. Only that she was.

The boat splashed once in the water, her almost-son and sometime-lover leaving the shore for the last time. Her lifetime was a fabric woven of losses, and she saw now that all of them had been practice, training her to teach her how to bear this pain like a boxer bloodying knuckles to make them strong and numb. All her life had been preparation for bearing this single, unbearable moment.

“Shit,” Erich said. “Were there only two dinners? What am I going to eat?”

Lydia plucked up the fork that had been Timmy’s, gripping the stem in her fist like holding his hand again, one last time. Touching what he had touched, because she would never touch him again. Here this object had opened his lips, felt the softness of his tongue, and been left behind. It held traces of him.

“What’s the matter?” Erich said. “Are you all right?”

I stopped being all right before you were born, she thought. What she said was, “There’s something I’d like you to do for me.”

* * *

The streets of Baltimore didn’t notice him pass through them this one last time. More than three million people lived and breathed, loved and lost, hoped and failed to hope that night, just as any other. A young woman hurrying home later than her father’s curfew dodged around a tall man with thinning hair and pants wet to the knee at the corner of South and Lombard, muttering obscenities and curses at him that spoke more of her own dread

and fear than anything the man had done. Four Star Helix security employees, out of uniform and off-shift, paused at the entrance to an Italian restaurant to watch a civilian pass. None of them could have said what it was about him that caught their attention, and it might only have been that they'd operated on high alert for so many days at once. The civilian went on, minding his own business, keeping himself to himself, and they went into the building's garlic and onion smells and forgot him. A bus driver stopped, let two old women, a thin-faced man, and a broad-shouldered amiable fellow come on board. Bus service was part of basic, and the machine followed its route automatically. No one paid, no one spoke, and the driver went back to watching the entertainment feeds as soon as the bus pulled back into traffic.

Nearer Oestra's safe house, things changed. There were more eyes, more of them alert. The catastrophe of the churn hung thick in the air, the sense that doom might come at any moment in the shape of security vans and riot gear and voices shouting to keep hands visible. Nothing like it had happened that day or the one before, but no one was taking comfort in that yet. The guards who stopped Timmy were different than the ones he'd seen earlier, but their placement on the street was the same. They stopped him, took the pistol that Burton had given him, scanned him for tracking devices, firearms, explosives, chemical agents, and when they found he was clean, they called in. Oestra's voice through their earpieces was less than a mosquito but still perfectly recognizable, a familiar buzz and whine. They waved Timmy on.

Oestra opened the door to him, automatic shotgun still in the lieutenant's hand, as if he hadn't put it down all day. Probably, he hadn't.

Timmy stepped into the main room, looking around pleasantly. The newsfeeds flickered silently on their screens: a street view from sometime earlier in the day with five security vans lined up outside a burning apartment building, a serious-faced Indian woman speaking into the camera with a dour expression, an ad with seven bouncing monkeys reaching for a box of banana-flavored cakes. The world cast its shadows on the bare brick wall and threw stories into the gray mortar. The churn, running itself to exhaustion. New stories from around the world and above it filling in the void.

"You're back," Oestra said.

“Yup.”

“You do the thing?”

“It got a little complicated,” Timmy said. “The man still here?”

“Wait. I’ll get him.”

Oestra walked to the back, one set of footsteps fading into the safe house, then a long pause made rich by the murmur of voices, then two sets of footsteps coming back. The timestamp beside the dour Indian woman read 21:42. Timmy considered the curtains. Blue-dyed cotton with cords of woven nylon. The chair Oestra had been sitting on before, leather stretched over a light metal frame. A kitchen in through a wide brickwork archway. The bedroom in the back with its futon, and a bathroom somewhere behind that.

“Tiny,” Burton said. “What’s the news, little man?”

Burton’s white shirt caught the light from the screens, dancing in a hundred colors. His slacks were dark and beautifully cut. Timmy turned to him like he was an old friend. Oestra walked past them both, taking his place by the window. Timmy glanced back at him only a few feet away, a shotgun across his thighs.

“Well,” Timmy said. “Truth is, I ran into a little hiccup.”

Burton crossed his arms, squared his shoulders and hips. “Something you couldn’t handle?” he asked, his voice hard with disapproval.

“I’m waiting to see,” Timmy said.

“Waiting to see if you can handle it?”

“Well, yeah,” Timmy said with a wide, open smile. “Actually, it’s kind of funny you put it that way.”

When the big man stepped back toward the window, the movement was so casual, so relaxed, that neither Oestra nor Burton recognized what was happening. Timmy’s thick fingers grabbed the back of the leather chair, pulling back and down fast and hard. Oestra twisted trying to keep from falling and also bring the shotgun to bear at the same time, managing neither. He spilled to the floor, Timmy’s knee coming down hard on his neck. Oestra’s muffled roar was equal parts outrage and pain. Timmy reached down and ripped the man’s right ear off, then punched down twice, three times, four. Burton ran for the back bedroom. There wasn’t much time.

Unable to use it with Timmy on his neck, Oestra dropped the shotgun

and twisted, trying to get his arms and legs under himself, trying to get the leverage to push Timmy back. Timmy reached down and hooked his finger into the gunman's left eye, bracing the head with his knee and turning his wrist until he felt the eyeball pop. Oestra's screams were wilder now, panic and pain taking over. Timmy let the pressure up, scooted to the left, and picked up the abandoned shotgun. He fired once into Oestra's head and the man stopped screaming.

Timmy trotted across the room, shotgun in one hand. Burton boiled out of the bedroom, pistols in either fist and teeth bared like a dog's. The front window shattered. Timmy ducked through the brick archway into the kitchen, shifted his grip on the shotgun, and swung it hard and low, leading with the elbow like a cricket player at the bat as Burton roared in after him. The sound of the connection was like a piece of raw steak being dropped on concrete. Burton's feet flew out from under him, but the momentum of his rush carried him stumbling into the space beyond. Timmy lowered the shotgun toward the man's head, but Burton whirled, dropping his own guns and grabbing the shotgun's barrel. The smell of burning skin was instantaneous. Timmy tried to pull back, but Burton kicked out. His right foot hit Timmy's knee like he'd kicked a fire hydrant, but Timmy still stumbled. The shotgun roared again, and the refrigerator sprouted pocks of twisted metal and plastic. Burton twisted, pulling himself in close. Too close for the shotgun's long barrel. He hammered his elbow into Timmy's ribs twice and felt something give the third time. Timmy dropped the shotgun, and then they were both down on the floor.

They grappled, caught in each other's arms, each man shifting for the position that would destroy the other in a parody of intimate love. The fingers of Burton's left hand worked their way under Timmy's chin, digging at his neck, pushing into the hard cartilage of his throat. Timmy choked, gagged, pulled back the centimeter that was all Burton needed. He pulled his right arm up into the gap, braced himself, twisted, and now Timmy's arm and head were locked. Burton gasped out a chuckle.

"You just fucked the wrong asshole," he hissed as Timmy bucked and struggled. "Your little cripple boyfriend? I'm gonna burn him down for days. I'm gonna find everyone you ever loved and kill them all slow."

Timmy grunted and pushed back, but the effort only made Burton's lock on him tighter.

“You thought you could take me, you dumbfuck piece of shit?” Burton spat into Timmy’s ear. “You thought you were tougher than *me*? I owned your momma, boy. You’re just second-generation *property*.”

All along their paired bodies, Burton felt Timmy tense and then, with a vast exhalation, relax, melting into the hold. Burton pulled tighter, squeezing. There was a report like a pistol shot when Timmy’s shoulder dislocated and the resistance stuttered. Burton’s grip broke. Timmy rolled, cocked back his fist and brought it down on the bridge of Burton’s nose. The pain was bright. The volume of the world faded. The fist came down again, jostling the kitchen. The light seemed strange, reducing the red of the bricks and the yellow of the stove to shades of gray. Burton tried to bring his arms up to cover his face, to shield him from the violence, but they were a very long way away, and he kept losing track of them. He had them up, but they were numb and boneless. The attacks easily brushed them aside. The fist hit his nose again, and he didn’t know if it was for the third time or the fourth.

Shit, he thought. *This is just going to keep going on until that fucker decides to stop.*

The impact came again, and Burton tried to say something, to scream. The impact came again, and afterward followed a few seconds of darkness and silence and calm. Burton felt very sleepy. The impact came again. Calm. The impact came again and again and again. Each time, the violence felt more distant and the emptiness between more profound until a kind of forgetfulness came over him.

Once Timmy was sure that he was alone in the apartment, he rolled onto his back. His left arm hung from the socket, limp, useless, and disconnected. He levered himself up to his knees, breathing hard between clenched teeth. Then stood. He took the automatic shotgun in his one good hand and stepped out to the main room. On the screen, the Indian woman was still speaking, wagging a finger at the camera to make a point. The timestamp beside her read 21:44. Two minutes. Maybe a little less. Timmy walked to the front window. The guards from the street weren’t at their posts. He nodded to himself and went to stand by the front door. When the knob turned, he waited. The door flew open, and he fired three times, once straight ahead, and then angling to the left and right. Someone started screaming and the door banged closed again.

Timmy went back to the kitchen. He flipped on the burners, pulled down the roll of cheap paper towels from the wall. He found a bottle of peanut oil in the cabinet and doused the towels with half of it before he put them directly on the heating element. A flurry of footsteps came from the front and he fired the shotgun again, not aiming at anything. They retreated. The oil-soaked paper caught fire, and Timmy picked up the burning roll, trotted to the bedroom, and threw the flaming mass into the bunched covers. By the time he was back in the kitchen, the flame shadows were already dancing in the archway behind him. Timmy put the half-full bottle of oil directly onto the heating element and walked to the back of the safe house. The stairway leading to the alley was narrow and white. He didn't see anyone, but he fired the shotgun twice anyway then tossed the gun back into the fire. If there had been a guard there, they'd fled. Timmy walked out into the night.

He moved slowly, but with purpose. When his path crossed with other people's he smiled and nodded. Once, when he had almost reached his destination, an old man in a black coat had stopped and stared at his bruised and bloody hand. Timmy smiled ruefully, shrugged, and didn't break stride. The old man didn't raise an alarm. Around here, a muscle-bound thug with blood on his cuffs and skinned knuckles didn't warrant anything more than a disapproving look.

The security forces had put a fresh lock on Lydia's door, but Timmy knew the back way in. He slid through the window into the bathroom he'd known so well over the last few years. It still smelled like her. They'd gone through everything. Her towels and the shower curtain were on the floor. Bottles of medications littered the sink. He dug through until he found some painkillers and dry swallowed three. In the kitchen, he wrapped his shoulder in ice, then waited motionless until the swelling was down as far as it was going to go. Putting his shoulder back in its socket was a question of lying on the bed, his grip on the mattress bottom hard and unforgiving, and then pulling back slowly, relaxing into the pain, until it slid back into place with a wet, angry pop. He stripped, washed himself with wet hand towels, and changed into a fresh set of his clothes. Ones that didn't have anybody's blood on them.

The churn, the crackdown, the catastrophe. The cycle of boom and bust. The turn of the seasons. Whatever name was applied to it, the inevitable cascade of events in the city rolled on just the same. When the fire trucks

came and put out the blaze, they identified the two bodies as Feivel Oestra and an unregistered man. The unregistered was a small, compact, dark-skinned man in an expensive shirt and tailored slacks. He had no tattoos, and a wide birthmark on his right shoulder blade in the shape of a rough triangle. Both men had died by violence. If the fire had been meant to conceal that, it failed. If it was only meant to foul any trace DNA or fingerprint evidence, it did well enough. Add to that the fact that Oestra was on the Star Helix lists as someone to bring in for questioning, and the broad strokes of the story came clear.

The same night, fifteen men loyal to the Loca Griega were surrounded in a nightclub. The hostage situation that rose out of it left two people dead and ten in custody, and the attendant lawsuits against Star Helix and the owners of the nightclub were the top of the local and regional newsfeeds. Oestra's death was little more than a footnote, something mentioned and then moved on from. Other things—smaller things—fell even below that level of obscurity. A woman selling illicit painkillers out of her apartment beside the arcology had a screaming fight with one of her clients, called security, and was taken away for questioning. A sweep of the ruins on the bay islands found a small squatters' camp with an LED lamp, an emergency prep sleeping bag, and an exhausted chemical stove, but anyone who had been living there was gone. An art dealer contacted with a request for assistance with an investigation killed himself rather than come in. None of those events raised any notice at all.

Soon, the paroxysm of violence, legal and otherwise, would thin back down to the normal background radiation of human vice. Very serious people would argue about whether the program had worked. Some would argue that crime had gone down, others that it had actually risen. Star Helix would take its payment from the government and settle out of court most of the complaints made against it. One of the remaining lieutenants would rise to the top, or the whole criminal apparatus would turn over to a new organization, a new generation. Within a year, there would be a new working normal that would run more or less gracefully until the next time. People of little importance would survive and make names for themselves. The mighty would fall, the meek would rise up in their places and become mighty. But all that would come later.

In the pearly light that came before the dawn, one other thing happened

that went unnoticed, meaningless to anyone but those involved.

It was on a street down near the water's edge. The eastern sky was brightening with the coming dawn, the western sky still boasted a scattering of stars. Traffic on the street was thick, but not yet the immobile crush that would come with the light. Sea and rot perfumed the air, but the cool made the scent seem almost pleasant. A tea-and-coffee stand was opening, sporting the blue-and-pink logo of a popular chain and a tray of baked goods just the same as a million other trays on five continents and two worlds. Old men and women on basic huffed down the sidewalk, getting in the day's exercise before the sun came up. Young men and women staggered home from long nights at the street clubs and rairai joints, exhausted from hours of dancing, drinking, sex, and frustrated hope. Soon, the streets and tube stations would thicken with the traffic of those who had jobs to go to, and then be released to the masses for whom basic was a way of life.

A boy on the verge of manhood stood on a corner near the tea-and-coffee stand. He was taller than average, and muscular. His close-cropped reddish-brown hair was receding, though he was young. His expression was blank, and he held himself in a tight, guarded way that could have been grief or the protecting of some physical injury. His right hand was swollen, the knuckles skinned. If it hadn't been for that last detail, the security team might have passed him by. Three women and two men, all in the ballistic armor and helmets of Star Helix.

"Morning," the team lead said, and half a beat later the tall man smiled and nodded. He turned to walk away, but the other personnel shifted to block his path.

The man tensed, then made the visible decision to relax. His smile was rueful. "Sorry. I was just heading out."

"I respect that, sir. We appreciate you taking a moment," the team lead said, placing a hand on the butt of his pistol. "Really did a number on your hand."

"Yeah. I box."

"Can be a good workout. I'm going to need to see your ID."

"Don't got it on me. Sorry."

"We'll need to check you against the database, then. That isn't a problem, is it?"

“Think I got the right to refuse that, don’t I?”

“You do,” the team lead said, letting a hint of hardness slip into his voice beneath the casual words. “But then we’d need to take you to the substation and do the full biometric scan to exclude you from the persons of interest list, and there are a whole lot of very unpleasant people who are in that queue. You don’t want to hang out with them. Not if you have someplace you need to be.”

The big man seemed to consider this. He glanced back over his shoulder.

“Looking for someone?” the team lead asked.

“Was more thinking there might be some folks looking for me.”

“So. How do you want to play this?”

The man shrugged and held out his hand. The team’s data analyst stepped forward and tapped the collector against the thick wrist. The readout stuttered red, then went to solid green. The seconds ticked away.

“If there’s something you want to tell me,” the team lead said, “this would be the time.”

“Nah,” the big man said. “I think I’m good.”

“Yeah?”

“You know,” he said, “good enough.”

The team lead’s hand terminal chimed. He pulled it out with his left hand, his right still on the butt of his gun. The readout had the red border of a flagged profile. The big man’s body went very still while they read. It was a long moment before the team lead spoke.

“Amos Burton.”

“Yeah?” the big man said. It could have meant, *Yes, I killed him*, or *What about him?* All the team lead heard was the affirmation.

“I’ve got a travel flag on you here. You’re cutting it pretty close.”

Amos Burton’s eyebrows rose and the corners of his mouth turned down. “I am?”

“You’re shipping out to Luna on the noon launch from Bogotá station, Mr. Burton. These apprenticeship programs are tough to get into, and last I heard, they take it mighty poorly if you miss your berth. Might wind up waiting another decade to get back on the list.”

“Huh,” the big man said.

“Look, there’s a high-speed line about nine blocks north of here. We can take you there if you want.”

“Erich, you sonofabitch,” the big man said. Instead of looking north, he turned to the east, toward the sea and rising sun. “I’m not Mr. Burton.”

“Sorry?”

“I’m not Mr. Burton,” the man said again. “You can call me Amos.”

“Whatever you want. But I think you’d better haul ass out of town if you don’t want to get in some serious shit, Amos.”

“You ain’t the only one that thinks that. But I’m good. I know where the high-speed lines are. I won’t miss my ride.”

“All right then,” the team lead said with a crisp nod. “Have a better one.”

The security team moved on, flowing around the big man like river water around a stone. Amos watched them go, then went to the tea-and-coffee stand, bought a cup of black coffee and a corn muffin. He stood on the corner for a long minute, eating and drinking and breathing the air of the only city he’d ever known. When he was done, he dropped the cup and the muffin wrapper into the recycling bin and turned north toward the high-speed line and Bogotá station and Luna. And, who knew, maybe the vastness beyond the moon. The sweep of planets and moons and asteroids that humanity had spread to, and where the chances of running into anybody from Baltimore were vanishingly small. A needle in a haystack all of humanity wide.

Amos Burton was a tall, stocky, pale-skinned man with an amiable smile, an unpleasant past, and a talent for cheerful violence. He left Baltimore to its dynamic balance of crime and law, exotics and mundanity, love and emptiness. The number of people who knew him and loved him could be counted on one hand and leave most of the fingers spare, and when he was gone, the city went on without him as if he had never been.

CIBOLA BURN

by James S. A. Corey

The gates have opened the way to thousands of habitable planets, and the land rush has begun. Settlers stream out from humanity's home planets in a vast, poorly controlled flood, landing on a new world. Among them, the Rocinante, haunted by the vast, posthuman network of the protomolecule as they investigate what destroyed the great intergalactic society that built the gates and the protomolecule.

But Holden and his crew must also contend with the growing tensions between the settlers and the company that owns the official claim to the planet. Both sides will stop at nothing to defend what's theirs, but soon a terrible disease strikes and only Holden—with help from the ghostly Detective Miller—can find the cure.

Chapter 1

Basia

Basia Merton had been a gentle man, once. He hadn't been the sort of man who made bombs out of old metal lubricant drums and mining explosives.

He rolled another one out of the little workshop behind his house and toward one of First Landing's electric carts. The little stretch of buildings spread to the north and south, and then ended, the darkness of the plain stretching to the horizon. The flashlight hanging from his belt bounced as he walked, casting strange moving shadows across the dusty ground. Small alien animals hooted at him from outside the circle of light.

Nights on Ilus—he wouldn't call it New Terra—were very dark. The planet had thirteen tiny, low-albedo moons spaced so consistently in the same orbit that everyone assumed they were alien artifacts. Wherever they'd come from, they were more like captured asteroids than real moons to someone who grew up on the planet-sized satellites of Jupiter. And they did nothing to catch and reflect the light of Ilus' sun once it set. The local nighttime wildlife was mostly small birds and lizards. Or what Ilus' new human inhabitants thought of as birds and lizards. They shared only the most superficial external traits and a primarily carbon base with their terrestrial namesakes.

Basia grunted with effort as he lifted the barrel onto the back of the cart, and a second later an answering grunt came from a few meters away. A mimic lizard, curiosity drawing it right up to the edge of the light, its small eyes glittering. It grunted again, its wide, leathery, bullfrog-shaped head bobbing, and the air sac below its neck inflating and deflating with the

sound. It waited for a moment, staring at him, and when he didn't respond, it crawled off into the dark.

Basia pulled elastic straps out of a toolbox and began securing the barrels to the bed of the cart. The explosive wouldn't go off just from falling on the ground. Or that was what Coop said, anyhow. Basia didn't feel like testing it.

"Baz," Lucia said. He flushed with embarrassment like a small boy caught stealing candy. Lucia knew what he was doing. He'd never been able to lie to her. But he'd hoped she would stay inside while he worked. Just her presence made him wonder if he was doing the right thing. If it was right, why did it make him so ashamed to have Lucia see him?

"Baz," she said again. Not insisting. Her voice sad, not angry.

"Lucy," he said, turning around. She stood at the edge of his light, a white robe clutched around her thin frame against the chill night air. Her face was a dark blur.

"Felcia's crying," she said, her tone not making it an accusation. "She's afraid for you. Come talk to your daughter."

Basia turned away and pulled the strap tight over the barrels, hiding his face from her. "I can't. They're coming," he said.

"Who? Who's coming?"

"You know what I mean. They're going to take everything we made here if we don't make a stand. We need time. This is how you get time. Without the landing pad, they've got to use the small shuttles. So we take away the landing pad. Make them rebuild it. No one's going to get hurt."

"If it gets bad," she said, "we can leave."

"No," Basia said, surprised to hear the violence in his voice. He turned and took a few steps, putting her face in the light. She was weeping. "No more leaving. We left Ganymede. Left Katoa and ran away and my family lived on a ship for a year while no one would give us a place to land. We're not running again. Not *ever* running again. *They* took all the children from me they get to take."

"I miss Katoa too," Lucia said. "But these people didn't kill him. It was a war."

"It was a business decision. They made a business decision, and then they made a war, and they took my son away." *And I let them*, he didn't say. *I took you and Felcia and Jacek, and I left Katoa behind because I thought*

he was dead. And he wasn't. The words were too painful to speak, but Lucia heard them anyway.

"It wasn't your fault."

Yes, *it was* floated at the back of his mouth, but he swallowed.

"These people don't have any right to Ilus," he said, struggling to make his voice sound reasonable. "We were here first. We staked claim. We'll get the first load of lithium out, get the money in, then we can hire lawyers back home to make a real case. If the corporations already have roots here when that happens, it won't matter. We just need time."

"If you do this," Lucia said, "they'll send you to jail. Don't do that to us. Don't do that to your family."

"I'm doing this *for* my family," he said softly. It was worse than yelling. He hopped up behind the controls and stomped on the accelerator. The cart lurched off with a whine. He didn't look back, couldn't look back and see Lucy.

"*For* my family," he said again.

He drove away from his house and the ramshackle town that they'd started out calling First Landing back when they'd picked the site off the *Barbapiccola's* sensor maps. No one had bothered to rename it when it had moved from being an idea to being a place. He drove toward the center of town, two rows of prefab buildings, until he hit the wide stretch of flattened dirt that served as the main road and turned toward the original landing site. The refugees who'd colonized Ilus had come down from their ship in small shuttles, so the only landing pad they'd needed was a flat stretch of ground. But the Royal Charter Energy people, the *corporate* people, who had a UN charter giving the world to them, would be coming down with heavy equipment. Heavy lift shuttles needed an actual landing pad. It had been built in the same open fields that the colony had used as their landing site.

That felt obscene to Basia. Invasive. The first landing site had significance. He'd imagined it someday being a park, with a monument at the center commemorating their arrival on this new world. Instead, RCE had built a giant and gleaming metal monstrosity right over the top of their site. Worse, they'd hired the colonists to build it, and enough of them had thought it was a good idea that they'd actually done it.

It felt like being erased from history.

Scotty and Coop were waiting for him at the new landing pad when he

arrived. Scotty was sitting on the edge of the metal platform, legs dangling over the side, smoking a pipe and spitting on the ground below his feet. A small electric lamp that sat beside him colored him with an eerie green light. Coop stood a little way off, looking up at the sky with bared teeth. Coop was an old-school Belter, and the agoraphobia treatments had been harder for him than others. The thin-faced man kept staring up at the void, fighting to get used to it like a kid pulling off scabs.

Basia pulled the cart up to the edge of the pad and hopped out to undo the straps holding the barrel bombs down.

“Give me a hand?” he said. Ilus was a large planet, slightly over one gravity. Even after six months of pharma to build his muscles and bones everything still felt too heavy. The thought of lifting the barrels back to the ground made the muscles in his shoulders twitch in anticipated exhaustion.

Scotty slid off the landing pad and dropped a meter and a half to the ground. He pushed his oily black hair out of his eyes and took another long puff on his pipe. Basia caught the pungent, skunky smell of Scotty’s bathtub-grown cannabis mixed with freeze-dried tobacco leaves. Coop looked over, his eyes fighting for focus for a moment, and then the thin, cruel smile. The plan had been Coop’s from the start.

“Mmm,” Coop said. “Pretty.”

“Don’t get attached,” Basia said. “They won’t be around long.”

Coop made a booming sound and grinned. Together they pulled the four heavy barrels off the cart and stood them in a row next to the pad. By the last one, they were all panting with effort. Basia leaned against the cart for a moment in silence while Scotty smoked off the last of his pipe and Coop set the blasting caps on the barrels. The detonators sat in the back of the cart like sleeping rattlesnakes, the red LEDs dormant for now.

In the darkness, the township sparkled. The houses they’d all built for themselves and one another glittered like stars brought down from the sky. Beyond them, there were the ruins. A long, low alien structure with two massive towers rising up above the landscape like a termite hill writ large. All of it was run through with passageways and chambers that no human had designed. In daylight, the ruins shone with the eerie colors of mother-of-pearl. In the night, they were only a deeper darkness. The mining pits were off past them, invisible as all but the dimmest glow of the work lights on the belly of the clouds. Truth was Basia didn’t like the mines. The ruins

were strange relics of the empty planet's past, and like anything that was uncanny without posing a threat, they faded from his awareness after the first few months. The mines carried history and expectations. He'd spent half a lifetime in tunnels of ice, and tunnels that ran through alien soil *smelled* wrong.

Coop made a sharp noise and shook his hand, cursing. Nothing blew up, so it couldn't be that bad.

"You think they'll pay us to rebuild it?" Scotty asked.

Basia cursed and spat on the ground.

"We wouldn't have to do this if it wasn't for people wanting to suck on RCE's tit," he said as he rolled the last barrel into place. "They can't land without this. All we had to do was not build it."

Scotty laughed out a cloud of smoke. "They were coming anyway. Might as well take their money. That's what people said."

"People are idiots," Basia said.

Scotty nodded, then smacked a mimic lizard off the passenger seat of the cart with one hand and sat down. He put his feet up on the dash and took another long puff on his pipe. "We gonna have to get gone, if we blow this. That blasting powder makes serious boom."

"Hey, mate," Coop shouted. "We're good. Let's make the place, ah?"

Scotty stood and started walking toward the pad. Basia stopped him, plucked the lit pipe from between his lips, and put it on the hood of the cart.

"Explosives," Basia said. "They explode."

Scotty shrugged, but he also looked chagrined. Coop was already easing the first barrel down onto its side when they reached him. "It's buena work this. Solid."

"Thank you," Basia said.

Coop lay down, back against the ground. Basia lay beside him. Scotty rolled the first bomb gently between them.

Basia climbed under the pad, pulling himself through the tangle of crisscrossed I-beams to each of the four barrels, turning on the remote detonators and syncing them. He heard a growing electric whine and felt a moment of irritation at Scotty for driving off with the cart before he realized the sound was of a cart arriving, not leaving.

"Hey," Peter's familiar voice yelled.

"Que la moog bastard doing here?" Coop muttered, wiping his hand

across his forehead.

“You want me to go find out?” Scotty asked.

“Basia,” Coop said. “Go see what Peter needs. Scotty hasn’t got his back dirty yet.”

Basia shifted himself out from under the landing and made room for Scotty and the last of the four bombs. Peter’s cart was parked beside his own, and Peter stood between them, shifting from one foot to the other like he needed to piss. Basia’s back and arms ached. He wanted this all over and to be back home with Lucia and Felcia and Jacek.

“What?” Basia said.

“They’re coming,” Pete said, whispering as if there were anyone who could hear them.

“Who’s coming?”

“Everyone. The provisional governor. The corporate security team. Science and tech staff. *Everybody*. This is serious. They’re landing a whole new government for us.”

Basia shrugged. “Old news. They been burning eighteen months. That’s why we’re out here.”

“No,” Pete said, prancing nervously and looking up at the stars. “They’re coming right now. *Edward Israel* did a braking burn half an hour ago. Got into high orbit.”

The copper taste of fear flooded Basia’s mouth. He looked up at the darkness. A billion unfamiliar stars, his same Milky Way galaxy, everyone figured, just seen from a different angle. His eyes shifted frantically, and then he caught it. The movement was subtle as the minute hand on an analog clock, but he saw it. The drop ship was dropping. The heavy shuttle was coming for the landing pad.

“I was going to get on the radio, but Coop said they monitor radio spectrum and—” Pete said, but then by Basia was already running back to the landing pad. Scotty and Coop were just pulling themselves out. Coop clapped clouds of dust off his pants and grinned.

“We got a problem,” Basia said. “Ship’s already dropped. Looks like they’re in atmosphere already.”

Coop looked up. The brightness from his flashlight threw shadows across his cheeks and into his eyes.

“Huh,” he said.

"I thought you were on this, man. I thought you were paying attention to where they were."

Coop shrugged, neither agreeing nor denying.

"We've got to get the bombs back out," Basia said. Scotty started to kneel, but Coop put a restraining hand on his shoulder.

"Why?" he asked.

"They try to land now, they could set it all off," Basia said.

Coop's smile was gentle. "Could," he said. "And what if?"

Basia balled his fists. "They're coming down *now*."

"See that," Coop said. "Doesn't inspire a great sense of obligation. And however you cut it, there ain't time to pull them."

"Can take off the primers and caps," Basia said, hunkering down. He played his flashlight over the pad's superstructure.

"Maybe could, maybe couldn't," Coop said. "Question's should, and it's a limp little question."

"Coop?" Scotty said, his voice thin and uncertain. Coop ignored him.

"Opportunity, looks like to me," Coop said.

"There's people on that thing," Basia said, crawling under the pad. The nearest bomb's electronics were flat against the dirt. He put his aching shoulder against it and pushed.

"Isn't time, mate," Coop called.

"Might be if you got your ass in here," Basia shouted. The blasting cap clung to the barrel's side like a tick. Basia tried to dig his fingers into the sealant goo and pry the cap away.

"Oh shit," Scotty said with something too much like awe in his voice. "Baz, oh *shit*!"

The cap came loose. Basia pushed it in his pocket and started crawling toward the second bomb.

"No time," Coop shouted. "Best we get clear, try and blow it while they can still pull up."

In the distance, he heard one of the carts taking off. Pete, going for distance. And under that, another sound. The bass roar of braking engines. He looked at the three remaining bombs in despair and rolled out from under the pad. The shuttle was massive in the black sky, so close he could make out the individual thrusters.

He wasn't going to make it.

“Run!” he shouted. He and Scotty and Coop sprinted back toward the cart. The roar of the shuttle rose, grew deafening. Basia reached the cart and scooped up the detonator. If he could blow it early, the shuttle could pull out, get away.

“Don’t!” Coop shouted. “We’re too close!”

Basia slammed his palm on the button.

The ground rose up, hitting him hard, the rough dirt and rocks tearing at his hands and cheek as he came to a stop, but the pain was a distant thing. Some part of him knew he might be hurt very badly, might be in shock, but that seemed distant and easy to ignore too. What struck him most was how quiet everything was. The world of sound stopped at his skull. He could hear his own breath, his heartbeat. Everything past that had the volume turned down to one.

He rolled onto his back and stared up at the star-speckled night sky. The heavy shuttle streaked overhead, half of it trailing fire, the sound of its engines no longer a bass roar but the scream of a wounded animal that he felt in his belly more than heard. The shuttle had been too close, the blast too large, some unlucky debris thrown into just the right path. No way to know. Some part of Basia knew this was very bad, but it was hard to pay much attention to it.

The shuttle disappeared from view, shrieking a death wail across the valley that came to him as a faint high piping sound, then sudden silence. Scotty was sitting beside him on the ground, staring off in the direction the ship had gone. Basia let himself lie back down.

When the bright spots it had left in his vision faded, the stars returned. Basia watched them twinkle, and wondered which one was Sol. So far away. But with the gates, close too. He’d knocked their shuttle down. They’d have to come now. He’d left them no choice.

A sudden spasm of coughing took him. It felt like his lungs were full of fluid, and he coughed it up for several minutes. With the coughing the pain finally came, wracking him from head to foot.

With the pain came the fear.

ANCILLARY JUSTICE

by Ann Leckie

On a remote, icy planet, the soldier known as Breq is drawing closer to completing her quest.

Breq is both more than she seems and less than she was. Years ago, she was the Justice of Toren—a colossal starship with an artificial intelligence linking thousands of corpse soldiers in the service of the Radch, the empire that conquered the galaxy.

An act of treachery has ripped it all away, leaving her with only one fragile human body. And only one purpose—to revenge herself on Anaander Mianaai, many-bodied, near-immortal Lord of the Radch.

OceanofPDF.com

1

The body lay naked and facedown, a deathly gray, spatters of blood staining the snow around it. It was minus fifteen degrees Celsius and a storm had passed just hours before. The snow stretched smooth in the wan sunrise, only a few tracks leading into a nearby ice-block building. A tavern. Or what passed for a tavern in this town.

There was something itchy familiar about that outthrown arm, the line from shoulder down to hip. But it was hardly possible I knew this person. I didn't know anyone here. This was the icy back end of a cold and isolated planet, as far from Radchaai ideas of civilization as it was possible to be. I was only here, on this planet, in this town, because I had urgent business of my own. Bodies in the street were none of my concern.

Sometimes I don't know why I do the things I do. Even after all this time it's still a new thing for me not to know, not to have orders to follow from one moment to the next. So I can't explain to you why I stopped and with one foot lifted the naked shoulder so I could see the person's face.

Frozen, bruised, and bloody as she was, I knew her. Her name was Seivarden Vendaai, and a long time ago she had been one of my officers, a young lieutenant, eventually promoted to her own command, another ship. I had thought her a thousand years dead, but she was, undeniably, here. I crouched down and felt for a pulse, for the faintest stir of breath.

Still alive.

Seivarden Vendaai was no concern of mine anymore, wasn't my responsibility. And she had never been one of my favorite officers. I had obeyed her orders, of course, and she had never abused any ancillaries, never harmed any of my segments (as the occasional officer did). I had no reason to think badly of her. On the contrary, her manners were those of an educated, well-bred person of good family. Not toward me, of course—I wasn't a person, I was a piece of equipment, a part of the ship. But I had

never particularly cared for her.

I rose and went into the tavern. The place was dark, the white of the ice walls long since covered over with grime or worse. The air smelled of alcohol and vomit. A barkeep stood behind a high bench. She was a native—short and fat, pale and wide-eyed. Three patrons sprawled in seats at a dirty table. Despite the cold they wore only trousers and quilted shirts—it was spring in this hemisphere of Nilt and they were enjoying the warm spell. They pretended not to see me, though they had certainly noticed me in the street and knew what motivated my entrance. Likely one or more of them had been involved; Seivarden hadn't been out there long, or she'd have been dead.

"I'll rent a sledge," I said, "and buy a hypothermia kit."

Behind me one of the patrons chuckled and said, voice mocking, "Aren't you a tough little girl."

I turned to look at her, to study her face. She was taller than most Nilters, but fat and pale as any of them. She out-bulked me, but I was taller, and I was also considerably stronger than I looked. She didn't realize what she was playing with. She was probably male, to judge from the angular mazelike patterns quilting her shirt. I wasn't entirely certain. It wouldn't have mattered, if I had been in Radch space. Radchaai don't care much about gender, and the language they speak—my own first language—doesn't mark gender in any way. This language we were speaking now did, and I could make trouble for myself if I used the wrong forms. It didn't help that cues meant to distinguish gender changed from place to place, sometimes radically, and rarely made much sense to me.

I decided to say nothing. After a couple of seconds she suddenly found something interesting in the tabletop. I could have killed her, right there, without much effort. I found the idea attractive. But right now Seivarden was my first priority. I turned back to the barkeep.

Slouching negligently she said, as though there had been no interruption, "What kind of place you think this is?"

"The kind of place," I said, still safely in linguistic territory that needed no gender marking, "that will rent me a sledge and sell me a hypothermia kit. How much?"

"Two hundred shen." At least twice the going rate, I was sure. "For the sledge. Out back. You'll have to get it yourself. Another hundred for the

kit.”

“Complete,” I said. “Not used.”

She pulled one out from under the bench, and the seal looked undamaged. “Your buddy out there had a tab.”

Maybe a lie. Maybe not. Either way the number would be pure fiction. “How much?”

“Three hundred fifty.”

I could find a way to keep avoiding referring to the barkeep’s gender. Or I could guess. It was, at worst, a fifty-fifty chance. “You’re very trusting,” I said, guessing *male*, “to let such an indigent”—I knew Seivarden was male, that one was easy—“run up such a debt.” The barkeep said nothing. “Six hundred and fifty covers all of it?”

“Yeah,” said the barkeep. “Pretty much.”

“No, all of it. We will agree now. And if anyone comes after me later demanding more, or tries to rob me, they die.”

Silence. Then the sound behind me of someone spitting. “Radchaai scum.”

“I’m not Radchaai.” Which was true. You have to be human to be Radchaai.

“*He* is,” said the barkeep, with the smallest shrug toward the door. “You don’t have the accent but you stink like Radchaai.”

“That’s the swill you serve your customers.” Hoots from the patrons behind me. I reached into a pocket, pulled out a handful of chits, and tossed them on the bench. “Keep the change.” I turned to leave.

“Your money better be good.”

“Your sledge had better be out back where you said.” And I left.

The hypothermia kit first. I rolled Seivarden over. Then I tore the seal on the kit, snapped an internal off the card, and pushed it into her bloody, half-frozen mouth. Once the indicator on the card showed green I unfolded the thin wrap, made sure of the charge, wound it around her, and switched it on. Then I went around back for the sledge.

No one was waiting for me, which was fortunate. I didn’t want to leave bodies behind just yet, I hadn’t come here to cause trouble. I towed the sledge around front, loaded Seivarden onto it, and considered taking my outer coat off and laying it on her, but in the end I decided it wouldn’t be that much of an improvement over the hypothermia wrap alone. I powered

up the sledge and was off.

I rented a room at the edge of town, one of a dozen two-meter cubes of grimy, gray-green prefab plastic. No bedding, and blankets cost extra, as did heat. I paid—I had already wasted a ridiculous amount of money bringing Seivarden out of the snow.

I cleaned the blood off her as best I could, checked her pulse (still there) and temperature (rising). Once I would have known her core temperature without even thinking, her heart rate, blood oxygen, hormone levels. I would have seen any and every injury merely by wishing it. Now I was blind. Clearly she'd been beaten—her face was swollen, her torso bruised.

The hypothermia kit came with a very basic corrective, but only one, and only suitable for first aid. Seivarden might have internal injuries or severe head trauma, and I was only capable of fixing cuts or sprains. With any luck, the cold and the bruises were all I had to deal with. But I didn't have much medical knowledge, not anymore. Any diagnosis I could make would be of the most basic sort.

I pushed another internal down her throat. Another check—her skin was no more chill than one would expect, considering, and she didn't seem clammy. Her color, given the bruises, was returning to a more normal brown. I brought in a container of snow to melt, set it in a corner where I hoped she wouldn't kick it over if she woke, and then went out, locking the door behind me.

The sun had risen higher in the sky, but the light was hardly any stronger. By now more tracks marred the even snow of last night's storm, and one or two Nilters were about. I hauled the sledge back to the tavern, parked it behind. No one accosted me, no sounds came from the dark doorway. I headed for the center of town.

People were abroad, doing business. Fat, pale children in trousers and quilted shirts kicked snow at each other, and then stopped and stared with large surprised-looking eyes when they saw me. The adults pretended I didn't exist, but their eyes turned toward me as they passed. I went into a shop, going from what passed for daylight here to dimness, into a chill just barely five degrees warmer than outside.

A dozen people stood around talking, but instant silence descended as soon as I entered. I realized that I had no expression on my face, and set my facial muscles to something pleasant and noncommittal.

“What do you want?” growled the shopkeeper.

“Surely these others are before me.” Hoping as I spoke that it was a mixed-gender group, as my sentence indicated. I received only silence in response. “I would like four loaves of bread and a slab of fat. Also two hypothermia kits and two general-purpose correctives, if such a thing is available.”

“I’ve got tens, twenties, and thirties.”

“Thirties, please.”

She stacked my purchases on the counter. “Three hundred seventy-five.” There was a cough from someone behind me—I was being overcharged again.

I paid and left. The children were still huddled, laughing, in the street. The adults still passed me as though I weren’t there. I made one more stop—Seivarden would need clothes. Then I returned to the room.

Seivarden was still unconscious, and there were still no signs of shock as far as I could see. The snow in the container had mostly melted, and I put half of one brick-hard loaf of bread in it to soak.

A head injury and internal organ damage were the most dangerous possibilities. I broke open the two correctives I’d just bought and lifted the blanket to lay one across Seivarden’s abdomen, watched it puddle and stretch and then harden into a clear shell. The other I held to the side of her face that seemed the most bruised. When that one had hardened, I took off my outer coat and lay down and slept.

Slightly more than seven and a half hours later, Seivarden stirred and I woke. “Are you awake?” I asked. The corrective I’d applied held one eye closed, and one half of her mouth, but the bruising and the swelling all over her face was much reduced. I considered for a moment what would be the right facial expression, and made it. “I found you in the snow, in front of a tavern. You looked like you needed help.” She gave a faint rasp of breath but didn’t turn her head toward me. “Are you hungry?” No answer, just a vacant stare. “Did you hit your head?”

“No,” she said, quiet, her face relaxed and slack.

“Are you hungry?”

“No.”

“When did you eat last?”

“I don’t know.” Her voice was calm, without inflection.

I pulled her upright and propped her against the gray-green wall, gingerly, not wanting to cause more injury, wary of her slumping over. She stayed sitting, so I slowly spooned some bread-and-water mush into her mouth, working cautiously around the corrective. "Swallow," I said, and she did. I gave her half of what was in the bowl that way and then I ate the rest myself, and brought in another pan of snow.

She watched me put another half-loaf of hard bread in the pan, but said nothing, her face still placid. "What's your name?" I asked. No answer.

She'd taken kef, I guessed. Most people will tell you that kef suppresses emotion, which it does, but that's not all it does. There was a time when I could have explained exactly what kef does, and how, but I'm not what I once was.

As far as I knew, people took kef so they could stop feeling something. Or because they believed that, emotions out of the way, supreme rationality would result, utter logic, true enlightenment. But it doesn't work that way.

Pulling Seivarden out of the snow had cost me time and money that I could ill afford, and for what? Left to her own devices she would find herself another hit or three of kef, and she would find her way into another place like that grimy tavern and get herself well and truly killed. If that was what she wanted I had no right to prevent her. But if she had wanted to die, why hadn't she done the thing cleanly, registered her intention and gone to the medic as anyone would? I didn't understand.

There was a good deal I didn't understand, and nineteen years pretending to be human hadn't taught me as much as I'd thought.

About Orbit Short Fiction

Orbit Short Fiction presents digital editions of new stories from some of the most critically acclaimed and popular authors writing science fiction and fantasy today.

Visit www.orbitshortfiction.com to learn more about our publishing program—and to join the conversation. We look forward to hearing from you.

The background of the book cover is a dynamic, green-tinted illustration of a space battle. A large, complex space station or ship structure dominates the center, with various platforms and corridors visible. In the lower-left corner, a smaller spacecraft is shown in a fiery explosion, with bright orange and red flames and debris. The overall atmosphere is one of intense action and sci-fi adventure.

*To Jay Lake and Elmore Leonard.
Gentlemen, it has been a pleasure.*

OceanofPDF.com

Prologue: Bobbie Draper

A thousand worlds, Bobbie thought as the tube doors closed. And not just a thousand worlds. A thousand *systems*. Suns. Gas giants. Asteroid belts. Everything that humanity had spread to, a thousand times over. The screen above the seats across from her showed a newsfeed, but the speakers were broken, the man's voice too fuzzed to make out the words. The graphic that zoomed in and out beside him was enough for her to follow. New data had come in from the probes that had gone through the gates. Here was another image of an unfamiliar sun, circles to mark the orbits of new planets. All of them empty. Whatever had built the protomolecule and fired it toward Earth back in the depths of time wasn't answering calls anymore. The bridge builder had opened the way, and no great gods had come streaming through.

It was astounding, Bobbie thought, how quickly humanity could go from *What unimaginable intelligence fashioned these soul-wrenching wonders?* to *Well, since they're not here, can I have their stuff?*

" 'Scuse me," a man's phlegmy voice said. "You wouldn't have a little spare change for a veteran, would you?"

She looked away from the screens. The man was thin, gray-faced. His body had the hallmarks of a childhood in low g: long body, large head. He licked his lips and leaned forward.

"Veteran, are you?" she said. "Where'd you serve?"

"Ganymede," the man said, nodding and looking off with an attempt at nobility. "I was there when it all came down. When I got back here, government dropped me on my ass. I'm just trying to save up enough to book passage to Ceres. I've got family there."

Bobbie felt a bubble of rage in her breast, but she tried to keep her voice

and expression calm. “You try veteran’s outreach? Maybe they could help you.”

“I just need something to eat,” he said, his voice turning nasty. Bobbie looked up and down the car. Usually there would be a few people in the cars at this time. The neighborhoods under the Aurorae Sinus were all connected by evacuated tube. Part of the great Martian terraforming project that had begun before Bobbie was born and would go on long after she was dead. Just now, there was no one. She considered what she would look like to the beggar. She was a big woman, tall as well as broad, but she was sitting down, and the sweater she’d chosen was a little baggy. He might have been under the misapprehension that her bulk was fat. It wasn’t.

“What company did you serve with?” she asked. He blinked. She knew she was supposed to be a little scared of him, and he was uneasy because she wasn’t.

“Company?”

“What company did you serve with?”

He licked his lips again. “I don’t want to—”

“Because it’s a funny thing,” she said. “I could have sworn I knew pretty much everyone who was on Ganymede when the fighting started. You know, you go through something like that, and you remember. Because you see a lot of your friends die. What was your rank? I was gunnery sergeant.”

The gray face had gone closed and white. The man’s mouth pinched. He pushed his hands deeper into his pockets and mumbled something.

“And now?” Bobbie went on, “I work thirty hours a week with veteran’s outreach. And I’m just fucking sure we could give a fine upstanding veteran like you a break.”

He turned, and her hand went out to his elbow faster than he could pull away. His face twisted with fear and pain. She drew him close. When she spoke, her voice was careful. Each word clear and sharp.

“Find. Another. Story.”

“Yes, ma’am,” the beggar said. “I will. I’ll do that.”

The car shifted, decelerating into the first Breach Candy station. She let him go and stood up. His eyes went a little wider when she did. Her genetic line went back to Samoa, and she sometimes had that effect on people who weren’t expecting her. Sometimes she felt a little bad about it. Not now.

Her brother lived in a nice middle-class hole in Breach Candy, not far

from the lower university. She'd lived with him for a time after she got back home to Mars, and she was still putting the pieces of her life back together. It was a longer process than she'd expected. And part of the aftermath was that she felt like she owed her brother something. Family dinner nights was part of that.

The halls of Breach Candy were sparse. The advertisements on the walls flickered as she came near, face recognition tracking her and offering up the products and services they thought she might want. Dating services, gym memberships, take-out shwarma, the new Mbeki Soon film, psychological counseling. Bobbie tried not to take it personally. Still, she wished there were more people around, a few more faces to add variety to the mix. To let her tell herself the ads were probably meant for someone walking nearby. Not for her.

But Breach Candy wasn't as full as it used to be. There were fewer people in the tube stations and hallways, fewer people coming to the veteran's outreach program. She heard that enrollment at the upper university was down six percent.

Humanity hadn't managed a single viable colony on the new worlds yet, but the probe data was enough. Humanity had its new frontier, and the cities of Mars were feeling the competition.

As soon as she stepped in the door, the rich scent of her sister-in-law's gumbo thickening the air and making her mouth water, she heard her brother and nephew, voices raised. It knotted her gut, but they were family. She loved them. She owed them. Even if they made the idea of take-out shwarma seem awfully tempting.

"—not what I'm saying," her nephew said. He was in upper university now, but when the family started fighting, she could still hear the six-year-old in his voice.

Her brother boomed in reply. Bobbie recognized the percussive tapping of his fingertips against the tabletop as he made his points. Drumming as a rhetorical device. Their father did the same thing.

"Mars is not optional." Tap. "It is not secondary." Tap. "These gates and whatever's on the other side of them isn't our home. The terraforming effort —"

"I'm not arguing against the terraforming," her nephew said as she walked into the room. Her sister-in-law nodded to her from the kitchen

wordlessly. Bobbie nodded back. The dining room looked down into a living space where a muted newsfeed was showing long-distance images of unfamiliar planets with a beautiful black man in wire-rimmed glasses speaking earnestly between them. “All I’m saying is that we’re going to have a lot of new data. Data. That’s all I’m saying.”

The two of them were hunched over the table like there was an invisible chessboard between them. A game of concentration and intellect that wrapped them both up until they couldn’t see the world around them. In a lot of ways, that was true. She took her chair without either of them acknowledging she’d arrived.

“Mars,” her brother said, “is the most studied planet there is. It doesn’t matter how many new datasets you get that aren’t about Mars. They aren’t about Mars! It’s like saying that seeing pictures of a thousand other tables will tell you about the one you’re already sitting at.”

“Knowledge is good,” her nephew said. “You’re the one who always told me that. I don’t know why you’re getting so bent about it now.”

“How are things for you, Bobbie?” her sister-in-law said sharply, carrying a bowl to the table. Rice and peppers to use as a bed for the gumbo and a reminder to the others that there was a guest. The two men scowled at the interruption.

“Good,” Bobbie said. “The contract with the shipyards came through. It should help us place a lot of vets in new jobs.”

“Because they’re building exploration ships and transports,” her nephew said.

“*David.*”

“Sorry, Mom. But they are,” David replied, not backing down. Bobbie scooped the rice into her bowl. “All the ships that are easy to retrofit, they’re retrofitting, and then they’re making more so that people can go to all the new systems.”

Her brother took the rice and the serving spoon, chuckling under his breath to make it clear how little he respected his son’s opinion. “The first real survey team is just getting to the first of these places—”

“There are already people living on New Terra, Dad! There were a bunch of refugees from Ganymede—” He broke off, shooting a guilty glance at Bobbie. Ganymede wasn’t something they talked about over dinner.

“The survey team hasn’t landed yet,” her brother said. “It’s going to be years before we have anything like real colonies out there.”

“It’s going to be *generations* before anyone walks on the surface here! We don’t have a fucking magnetosphere!”

“Language, David!”

Her sister-in-law returned. The gumbo was black and fragrant with a sheen of oil across the top. The smell of it made Bobbie’s mouth water. She put it on the slate trivet and handed the serving spoon to Bobbie.

“And how’s your new apartment?” she asked.

“It’s nice,” Bobbie said. “Inexpensive.”

“I wish you weren’t living in Innis Shallow,” her brother said. “It’s a terrible neighborhood.”

“No one’s going to bother Aunt Bobbie,” her nephew said. “She’d rip their heads off.”

Bobbie grinned. “Naw, I just look at them mean, and they—”

From the living room, there was a sudden glow of red light. The newsfeed had changed. Bright red banners showed at the top and bottom, and on the screen, a jowly Earth woman looked soberly into the camera. The image behind her was of fire and then a stock image of an old colony ship. The words, black against the white of the flames, read TRAGEDY ON NEW TERRA.

“What happened?” Bobbie said. “What just *happened*?”

Chapter One: Basia

Basia Merton had been a gentle man, once. He hadn't been the sort of man who made bombs out of old metal lubricant drums and mining explosives.

He rolled another one out of the little workshop behind his house and toward one of First Landing's electric carts. The little stretch of buildings spread to the north and south, and then ended, the darkness of the plain stretching to the horizon. The flashlight hanging from his belt bounced as he walked, casting strange moving shadows across the dusty ground. Small alien animals hooted at him from outside the circle of light.

Nights on Ilus—he wouldn't call it New Terra—were very dark. The planet had thirteen tiny, low-albedo moons spaced so consistently in the same orbit that everyone assumed they were alien artifacts. Wherever they'd come from, they were more like captured asteroids than real moons to someone who grew up on the planet-sized satellites of Jupiter. And they did nothing to catch and reflect the light of Ilus' sun once it set. The local nighttime wildlife was mostly small birds and lizards. Or what Ilus' new human inhabitants thought of as birds and lizards. They shared only the most superficial external traits and a primarily carbon base with their terrestrial namesakes.

Basia grunted with effort as he lifted the barrel onto the back of the cart, and a second later an answering grunt came from a few meters away. A mimic lizard, curiosity drawing it right up to the edge of the light, its small eyes glittering. It grunted again, its wide, leathery, bullfrog-shaped head bobbing, and the air sac below its neck inflating and deflating with the sound. It waited for a moment, staring at him, and when he didn't respond, it crawled off into the dark.

Basia pulled elastic straps out of a toolbox and began securing the barrels to the bed of the cart. The explosive wouldn't go off just from falling on the ground. Or that was what Coop said, anyhow. Basia didn't feel like testing it.

"Baz," Lucia said. He flushed with embarrassment like a small boy caught stealing candy. Lucia knew what he was doing. He'd never been able to lie to her. But he'd hoped she would stay inside while he worked. Just her presence made him wonder if he was doing the right thing. If it was right, why did it make him so ashamed to have Lucia see him?

"Baz," she said again. Not insisting. Her voice sad, not angry.

"Lucy," he said, turning around. She stood at the edge of his light, a white robe clutched around her thin frame against the chill night air. Her face was a dark blur.

"Felcia's crying," she said, her tone not making it an accusation. "She's afraid for you. Come talk to your daughter."

Basia turned away and pulled the strap tight over the barrels, hiding his face from her. "I can't. They're coming," he said.

"Who? Who's coming?"

"You know what I mean. They're going to take everything we made here if we don't make a stand. We need time. This is how you get time. Without the landing pad, they've got to use the small shuttles. So we take away the landing pad. Make them rebuild it. No one's going to get hurt."

"If it gets bad," she said, "we can leave."

"No," Basia said, surprised to hear the violence in his voice. He turned and took a few steps, putting her face in the light. She was weeping. "No more leaving. We left Ganymede. Left Katoa and ran away and my family lived on a ship for a year while no one would give us a place to land. We're not running again. Not *ever* running again. *They* took all the children from me they get to take."

"I miss Katoa too," Lucia said. "But these people didn't kill him. It was a war."

"It was a business decision. They made a business decision, and then they made a war, and they took my son away." *And I let them*, he didn't say. *I took you and Felcia and Jacek, and I left Katoa behind because I thought he was dead. And he wasn't.* The words were too painful to speak, but Lucia heard them anyway.

“It wasn’t your fault.”

Yes, *it was* floated at the back of his mouth, but he swallowed.

“These people don’t have any right to Ilus,” he said, struggling to make his voice sound reasonable. “We were here first. We staked claim. We’ll get the first load of lithium out, get the money in, then we can hire lawyers back home to make a real case. If the corporations already have roots here when that happens, it won’t matter. We just need time.”

“If you do this,” Lucia said, “they’ll send you to jail. Don’t do that to us. Don’t do that to your family.”

“I’m doing this *for* my family,” he said softly. It was worse than yelling. He hopped up behind the controls and stomped on the accelerator. The cart lurched off with a whine. He didn’t look back, couldn’t look back and see Lucy.

“*For* my family,” he said again.

He drove away from his house and the ramshackle town that they’d started out calling First Landing back when they’d picked the site off the *Barbapiccola*’s sensor maps. No one had bothered to rename it when it had moved from being an idea to being a place. He drove toward the center of town, two rows of prefab buildings, until he hit the wide stretch of flattened dirt that served as the main road and turned toward the original landing site. The refugees who’d colonized Ilus had come down from their ship in small shuttles, so the only landing pad they’d needed was a flat stretch of ground. But the Royal Charter Energy people, the *corporate* people, who had a UN charter giving the world to them, would be coming down with heavy equipment. Heavy lift shuttles needed an actual landing pad. It had been built in the same open fields that the colony had used as their landing site.

That felt obscene to Basia. Invasive. The first landing site had significance. He’d imagined it someday being a park, with a monument at the center commemorating their arrival on this new world. Instead, RCE had built a giant and gleaming metal monstrosity right over the top of their site. Worse, they’d hired the colonists to build it, and enough of them had thought it was a good idea that they’d actually done it.

It felt like being erased from history.

Scotty and Coop were waiting for him at the new landing pad when he arrived. Scotty was sitting on the edge of the metal platform, legs dangling over the side, smoking a pipe and spitting on the ground below his feet. A

small electric lamp that sat beside him colored him with an eerie green light. Coop stood a little way off, looking up at the sky with bared teeth. Coop was an old-school Belter, and the agoraphobia treatments had been harder for him than others. The thin-faced man kept staring up at the void, fighting to get used to it like a kid pulling off scabs.

Basia pulled the cart up to the edge of the pad and hopped out to undo the straps holding the barrel bombs down.

“Give me a hand?” he said. Ilus was a large planet, slightly over one gravity. Even after six months of pharma to build his muscles and bones everything still felt too heavy. The thought of lifting the barrels back to the ground made the muscles in his shoulders twitch in anticipated exhaustion.

Scotty slid off the landing pad and dropped a meter and a half to the ground. He pushed his oily black hair out of his eyes and took another long puff on his pipe. Basia caught the pungent, skunky smell of Scotty’s bathtub-grown cannabis mixed with freeze-dried tobacco leaves. Coop looked over, his eyes fighting for focus for a moment, and then the thin, cruel smile. The plan had been Coop’s from the start.

“Mmm,” Coop said. “Pretty.”

“Don’t get attached,” Basia said. “They won’t be around long.”

Coop made a booming sound and grinned. Together they pulled the four heavy barrels off the cart and stood them in a row next to the pad. By the last one, they were all panting with effort. Basia leaned against the cart for a moment in silence while Scotty smoked off the last of his pipe and Coop set the blasting caps on the barrels. The detonators sat in the back of the cart like sleeping rattlesnakes, the red LEDs dormant for now.

In the darkness, the township sparkled. The houses they’d all built for themselves and one another glittered like stars brought down from the sky. Beyond them, there were the ruins. A long, low alien structure with two massive towers rising up above the landscape like a termite hill writ large. All of it was run through with passageways and chambers that no human had designed. In daylight, the ruins shone with the eerie colors of mother-of-pearl. In the night, they were only a deeper darkness. The mining pits were off past them, invisible as all but the dimmest glow of the work lights on the belly of the clouds. Truth was Basia didn’t like the mines. The ruins were strange relics of the empty planet’s past, and like anything that was uncanny without posing a threat, they faded from his awareness after the

first few months. The mines carried history and expectations. He'd spent half a lifetime in tunnels of ice, and tunnels that ran through alien soil *smelled* wrong.

Coop made a sharp noise and shook his hand, cursing. Nothing blew up, so it couldn't be that bad.

"You think they'll pay us to rebuild it?" Scotty asked.

Basia cursed and spat on the ground.

"We wouldn't have to do this if it wasn't for people wanting to suck on RCE's tit," he said as he rolled the last barrel into place. "They can't land without this. All we had to do was not build it."

Scotty laughed out a cloud of smoke. "They were coming anyway. Might as well take their money. That's what people said."

"People are idiots," Basia said.

Scotty nodded, then smacked a mimic lizard off the passenger seat of the cart with one hand and sat down. He put his feet up on the dash and took another long puff on his pipe. "We gonna have to get gone, if we blow this. That blasting powder makes serious boom."

"Hey, mate," Coop shouted. "We're good. Let's make the place, ah?"

Scotty stood and started walking toward the pad. Basia stopped him, plucked the lit pipe from between his lips, and put it on the hood of the cart.

"Explosives," Basia said. "They explode."

Scotty shrugged, but he also looked chagrined. Coop was already easing the first barrel down onto its side when they reached him. "It's buena work this. Solid."

"Thank you," Basia said.

Coop lay down, back against the ground. Basia lay beside him. Scotty rolled the first bomb gently between them.

Basia climbed under the pad, pulling himself through the tangle of crisscrossed I-beams to each of the four barrels, turning on the remote detonators and syncing them. He heard a growing electric whine and felt a moment of irritation at Scotty for driving off with the cart before he realized the sound was of a cart arriving, not leaving.

"Hey," Peter's familiar voice yelled.

"Que la moog bastard doing here?" Coop muttered, wiping his hand across his forehead.

"You want me to go find out?" Scotty asked.

“Basia,” Coop said. “Go see what Peter needs. Scotty hasn’t got his back dirty yet.”

Basia shifted himself out from under the landing and made room for Scotty and the last of the four bombs. Peter’s cart was parked beside his own, and Peter stood between them, shifting from one foot to the other like he needed to piss. Basia’s back and arms ached. He wanted this all over and to be back home with Lucia and Felcia and Jacek.

“What?” Basia said.

“They’re coming,” Pete said, whispering as if there were anyone who could hear them.

“Who’s coming?”

“Everyone. The provisional governor. The corporate security team. Science and tech staff. *Everybody*. This is serious. They’re landing a whole new government for us.”

Basia shrugged. “Old news. They been burning eighteen months. That’s why we’re out here.”

“No,” Pete said, prancing nervously and looking up at the stars. “They’re coming right now. *Edward Israel* did a braking burn half an hour ago. Got into high orbit.”

The copper taste of fear flooded Basia’s mouth. He looked up at the darkness. A billion unfamiliar stars, his same Milky Way galaxy, everyone figured, just seen from a different angle. His eyes shifted frantically, and then he caught it. The movement was subtle as the minute hand on an analog clock, but he saw it. The drop ship was dropping. The heavy shuttle was coming for the landing pad.

“I was going to get on the radio, but Coop said they monitor radio spectrum and—” Pete said, but by then Basia was already running back to the landing pad. Scotty and Coop were just pulling themselves out. Coop clapped clouds of dust off his pants and grinned.

“We got a problem,” Basia said. “Ship’s already dropped. Looks like they’re in atmosphere already.”

Coop looked up. The brightness from his flashlight threw shadows across his cheeks and into his eyes.

“Huh,” he said.

“I thought you were on this, man. I thought you were paying attention to where they were.”

Coop shrugged, neither agreeing nor denying.

"We've got to get the bombs back out," Basia said. Scotty started to kneel, but Coop put a restraining hand on his shoulder.

"Why?" he asked.

"They try to land now, they could set it all off," Basia said.

Coop's smile was gentle. "Could," he said. "And what if?"

Basia balled his fists. "They're coming down *now*."

"See that," Coop said. "Doesn't inspire a great sense of obligation. And however you cut it, there ain't time to pull them."

"Can take off the primers and caps," Basia said, hunkering down. He played his flashlight over the pad's superstructure.

"Maybe could, maybe couldn't," Coop said. "Question's should, and it's a limp little question."

"Coop?" Scotty said, his voice thin and uncertain. Coop ignored him.

"Opportunity, looks like to me," Coop said.

"There's people on that thing," Basia said, crawling under the pad. The nearest bomb's electronics were flat against the dirt. He put his aching shoulder against it and pushed.

"Isn't time, mate," Coop called.

"Might be if you got your ass in here," Basia shouted. The blasting cap clung to the barrel's side like a tick. Basia tried to dig his fingers into the sealant goo and pry the cap away.

"Oh shit," Scotty said with something too much like awe in his voice. "Baz, oh *shit*!"

The cap came loose. Basia pushed it in his pocket and started crawling toward the second bomb.

"No time," Coop shouted. "Best we get clear, try and blow it while they can still pull up."

In the distance, he heard one of the carts taking off. Pete, going for distance. And under that, another sound. The bass roar of braking engines. He looked at the three remaining bombs in despair and rolled out from under the pad. The shuttle was massive in the black sky, so close he could make out the individual thrusters.

He wasn't going to make it.

"Run!" he shouted. He and Scotty and Coop sprinted back toward the cart. The roar of the shuttle rose, grew deafening. Basia reached the cart and

scooped up the detonator. If he could blow it early, the shuttle could pull out, get away.

“Don’t!” Coop shouted. “We’re too close!”

Basia slammed his palm on the button.

The ground rose up, hitting him hard, the rough dirt and rocks tearing at his hands and cheek as he came to a stop, but the pain was a distant thing. Some part of him knew he might be hurt very badly, might be in shock, but that seemed distant and easy to ignore too. What struck him most was how quiet everything was. The world of sound stopped at his skull. He could hear his own breath, his heartbeat. Everything past that had the volume turned down to one.

He rolled onto his back and stared up at the star-speckled night sky. The heavy shuttle streaked overhead, half of it trailing fire, the sound of its engines no longer a bass roar but the scream of a wounded animal that he felt in his belly more than heard. The shuttle had been too close, the blast too large, some unlucky debris thrown into just the right path. No way to know. Some part of Basia knew this was very bad, but it was hard to pay much attention to it.

The shuttle disappeared from view, shrieking a death wail across the valley that came to him as a faint high piping sound, then sudden silence. Scotty was sitting beside him on the ground, staring off in the direction the ship had gone. Basia let himself lie back down.

When the bright spots it had left in his vision faded, the stars returned. Basia watched them twinkle, and wondered which one was Sol. So far away. But with the gates, close too. He’d knocked their shuttle down. They’d have to come now. He’d left them no choice.

A sudden spasm of coughing took him. It felt like his lungs were full of fluid, and he coughed it up for several minutes. With the coughing the pain finally came, wracking him from head to foot.

With the pain came the fear.

Chapter Two: Elvi

The shuttle bucked, throwing Elvi Okoye against her restraints hard enough to knock the wind out of her and then pushing her back into the overwhelming embrace of her crash couch. The light flickered, went black, and then came back. She swallowed, her excitement and anticipation turning to animal fear. Beside her, Eric Vanderwert smiled the same half-leering, half-hopeful smile he'd flickered toward her over the past six months. Across from her, Fayeze's eyes had gone wide, his skin gray.

It's okay," Elvi said. "It's going to be okay."

Even as she spoke the words, a part of her cringed away from them. She didn't know what was going on. There was no earthly way she could know that anything was going to be okay. And still her first impulse was to assert it, to say it as if saying it made it true. A high whine rippled through the flesh of the shuttle, overtones crashing into each other. She felt her weight lurch to the left, the crash couches all shifting on their gimbals at the same time like choreographed dancers. She lost sight of Fayeze.

A tritone chime announced the pilot, and her voice came over the shuttle's public-address system.

"Ladies and gentlemen, it appears there has been a critical malfunction at the landing pad. We will not be able to complete the landing at this time. We will be returning to orbit and docking with the *Edward Israel* until such time as we can assess..."

She went quiet, but the hiss of an open line still ran through the ship. Elvi imagined the pilot distracted by something. The ship lurched and stuttered, and Elvi grabbed her restraints, hugging them to her. Someone nearby was praying loudly.

“Ladies and gentlemen,” the pilot said. “I’m afraid the malfunction at the landing pad has done our shuttle some damage. I don’t think we’re going to make it back upstairs right away. We have a dry lake bed not too far from here. I think we’re going to go take a look at that as a secondary landing site.”

Elvi felt a moment’s relief—*We still have a landing site*—followed at once by a deeper understanding and a deeper fear—*She means we’re going to crash*.

“I’m going to ask everyone to remain in their couches,” the pilot said. “Don’t take off your belts, and please keep your arms and legs inside the couch’s shell where it won’t bang against the side. The gel’s there for a reason. We’ll have you all down in just a couple minutes here.”

The forced, artificial calmness terrified Elvi more than shrieking and weeping would have. The pilot was doing everything she could to keep them all from panicking. Would anyone do that if they didn’t think panic was called for?

Her weight shifted again, pulling to the left, and then back, and then she grew light as the shuttle descended. The fall seemed to last forever. The rattle and whine of the shuttle rose to a screaming pitch. Elvi closed her eyes.

“We’re going to be fine,” she said to herself. “Everything’s okay.”

The impact split the shuttle open like lobster tail under a hammer. She had the brief impression of unfamiliar stars in a foreign sky, and her consciousness blinked out like God had turned off a switch.

Centuries before, Europeans had invaded the plague-emptied shell of the Americas, climbing aboard wooden ships with vast canvas sails and trusting the winds and the skill of sailors to take them from the lands they knew to what they called the New World. For as long as six months, religious fanatics and adventurers and the poverty-stricken desperate had consigned themselves to the uncharitable waves of the Atlantic Ocean.

Eighteen months ago, Elvi Okoye left Ceres Station under contract to Royal Charter Energy. The *Edward Israel* was a massive ship. Once, almost three generations before, it had been one of the colony ships that had taken

humanity to the Belt and the Jovian system. When the outpouring had ended and the pressure to expand had met its natural limits, the *Israel* had been repurposed as a water hauler. The age of expansion was over, and the romance of freedom gave way to the practicalities of life—air, water, and food, in that order. For decades, the ship had been a workhorse of the solar system, and then the Ring had opened. Everything changed again. Back at the Bush shipyards and Tycho Station a new generation of colony ships was being built, but the retrofit of the *Israel* had been faster.

When she'd stepped inside it the first time, Elvi had felt a sense of wonder and hope and excitement in the hum of the *Israel*'s air recyclers and the angles of her old-fashioned corridors. The age of adventure had come again, and the old warrior had returned, sword newly sharpened and armor shining again after tarnished years. Elvi had known that it was a psychological projection, that it said more about her own state of mind than anything physical about the ship, but that didn't diminish it. The *Edward Israel* was a colony ship once more, her holds filled with prefabbed buildings and high-atmosphere probes, manufacturing labs and even a repeat-scatter femtoscope. They had an exploration and mapping team, a geological survey team, a hydrology team, Elvi's own exozoological workgroup, and more. A university's worth of PhDs and a government lab's load of postdocs. Between crew and colonists, a thousand people.

They were a city in the sky and a boat of pilgrims bound for Plymouth Rock and Darwin's voyage on the *Beagle* all at the same time. It was the grandest and most beautiful adventure humanity had ever been on, and Elvi had earned a place on the exobiology team. In that context, imagining that the steel and ceramic of the ship was imbued with a sense of joy was a permissible illusion.

And all of it was ruled over by Governor Trying.

She'd seen him several times in the months they'd spent burning and braking, then making the slow, eerie transit between rings, and then burning and braking again. It wasn't until just before the drop itself that she'd actually spoken with him.

Trying was a thin man. His mahogany skin and snow-dust hair reminded her of her uncles, and his ready smile reassured and calmed. She had been in the observation deck, pretending that the high-resolution screens looking down on the planet were really windows, that the light of this unfamiliar

sun was actually bouncing off the wide, muddy seas and high frosted clouds and passing directly into her eyes even though the deceleration gravity meant they weren't in free orbit yet. It was a strange, beautiful sight. A single, massive ocean scattered with islands. A large continent that sprawled comfortably across half of a hemisphere, widest at the equator and then tapering as it reached north and south. The official name of the world was Bering Survey Four, named for the probe that had first established its existence. In the corridors and cafeteria and gym, they'd all come to call it New Terra. So at least she wasn't the only one swept up by the romance.

"What are you thinking, Doctor Okoye?" Trying's gentle voice asked, and Elvi had jumped. She hadn't heard him come in. Hadn't seen him beside her. She felt like she was supposed to bow or make some sort of formal report. But his expression was so soft, so amused, she let it go.

"I'm wondering what I did to deserve all this," she said. "I'm about to see the first genuinely alien biosphere. I'm about to learn things about evolution that were literally impossible to know until now. I must have been a very, very good person in a past life."

In the screens, New Terra glittered brown and gold and blue. The high atmospheric winds smudged greenish clouds halfway around the planet. Elvi leaned in toward it. The governor chuckled.

"You will be famous," he said.

Elvi blinked and coughed out a laugh.

"I guess I will be, won't I?" she said. "We're doing things humanity's never done before."

"Some things," Trying said. "And some things we have always done. I hope history treats us gently."

She didn't quite know what he'd meant by that, but before she could ask, Adolphus Murtry came in. A thin man with hard blue eyes, Murtry was the head of security and as hard and efficient as Trying was avuncular. The two men had walked off together, leaving Elvi alone with the world that was about to be hers to explore.

The heavy shuttle was as large as some ships Elvi had been on. They'd had to build a landing pad on the surface just to support it. It carried the first fifty structures, basic array laboratories, and—most important—a hard perimeter dome.

She had filed through the close-packed hallway of the shuttle, letting her

hand terminal lead her toward her assigned crash couch. When the first colonies had begun on Mars, the perimeter domes had been a question of survival. Something to hold in air and keep out radiation. On New Terra, it was all about limiting contamination. The corporate charter that RCE had taken required that their presence have the smallest possible footprint. She'd heard that there were other people already on the planetary surface, and hopefully they were also being careful not to disturb the sites they were on. If they weren't, the interactions between local organisms and the ones that had been shipped in would be complex. Maybe impossible to tease apart.

"You look troubled."

Fayez Sarkis sat on a crash couch, strapping the wide belts across his chest and waist. He'd grown up on Mars, and had the tall, thin frame and large head of low gravity. He looked at home in a crash couch. Elvi realized her hand terminal was telling her that she'd found her own place. She sat, the gel forming itself around her thighs and lower back. She always wanted to sit up in a crash couch, like a kid in a wading pool. Letting herself sink into it felt too much like being eaten.

"Just thinking ahead," she said, forcing herself to lie back. "Lot of work to be done."

"I know," Fayez said with a sigh. "Break time's over. Now we have to actually earn our keep. Still, it was fun while it lasted. I mean apart from burning at a full g."

"New Terra's a little over that, you know."

"Don't remind me," he said. "I don't know why we couldn't start with some nice balsawood planet with a civilized gravity well."

"Luck of the draw," Elvi said.

"Well, as soon as we get papers for a decent Mars-like planet, I'm transferring."

"You and half of Mars."

"I know, right? Someplace with maybe a breathable atmosphere. A magnetic field so we don't all have to live like mole rats. It's like having the terraforming project done already, except I'm alive to see it."

Elvi laughed. Fayez was on the geology team and the hydrological workgroup both. He'd studied at the best universities outside Earth, and she knew from long acquaintance that he was at least as frightened and

delighted as she was. Eric Vanderwert came by, easing himself into the couch beside Elvi. She smiled at him politely. In the year and a half out from Ceres, there had been any number of romantic or if not romantic at least sexual connections made between members of the science teams. Elvi had kept herself out of that tangle. She'd learned early that sexual entanglements and work were a toxic and unstable mixture.

Eric nodded to Fayez, then turned his attention to her.

"Exciting," he said.

"Yes," Elvi said, and across from her, Fayez rolled his eyes.

Murtry walked through, stepping between the crash couches. His gaze flickered over everything—the couches, the belts, the faces of the people preparing for drop. Elvi smiled at him, and he nodded to her sharply. It wasn't hostile, just businesslike. She watched him size her up. It wasn't the sexual way that a man considered a woman. It was like a loader making sure a crate's magnetic clamps were firing. He nodded to her again, apparently satisfied that she'd gotten her belts right, and moved on. When he was out of sight, Fayez chuckled.

"Poor bastard's chewing the walls," he said, nodding after Murtry.

"Is he?" Eric said.

"Had us all under his thumb for a year and a half, hasn't he? Now we're going down and he's staying in orbit. Man's petrified that we're all going to get ourselves killed on his watch."

"At least he cares," Elvi said. "I like him for that."

"You like everyone," Fayez teased. "It's your pathology."

"You don't like anyone."

"That's mine," he said, grinning.

The tritone alert came and the public-address system clicked.

"Ladies and gentlemen, my name is Patricia Silva and I'm your pilot on this little milk run."

A chorus of laughter rose from the crash couches.

"We're going to be detaching from the *Israel* in about ten minutes, and we're expecting the drop to take about fifty. So an hour from now, you're all going to be breathing entirely new air. We've got the governor on board, so we're going to make sure this all goes smooth and easy so we can put in for a performance bonus."

Everyone was giddy then. Even the pilot. Elvi grinned and Fayez

grinned back at her. Eric cleared his throat.

“Well,” Fayez said with mock resignation. “We came all this way. I suppose we should finish it.”

The pain didn't have a location. It was too large for that. It spread everywhere, encompassed everything. Elvi realized that she'd been looking at something. A massive, articulated crab leg, maybe. Or a broken construction crane. The flat ground of the lake bed stretched out toward it, and then grew rougher until it reached the thing's base. She could imagine it had pushed its way out of the dark, dry soil or that it had crashed down into it. Her agonized mind tried to make it into debris from the shuttle and failed.

It was an artifact. Ruins. Some arcane structure left from the alien civilization that had designed the protomolecule and the rings, abandoned and empty now. Elvi had the sudden, powerful and disjointed memory of an art exhibit she'd seen as a girl. There had been a high-resolution image of a bicycle in a ditch outside the ruins of Glasgow. The aftermath of disaster in a single image, as compressed and eloquent as a poem.

At least I got to see it, she thought. At least I got to be here before I died.

Someone had dragged her out of the ruined shuttle. When she turned her head, she could see construction lights burning yellow-white and the others laid out on the flat ground in rows. Some were standing. Moving among the injured and the dead. She didn't recognize their faces or the way their bodies moved. After a year and a half on the *Israel*, she knew everyone on sight, and these were strangers. The locals, then. The squatters. Illegals. The air smelled like burning dust and cumin.

She must have blacked out, because the woman seemed to appear at Elvi's side in the blink of an eye. Her hands were bloody and her face smeared with dirt and gore not her own.

“You're banged up, but you're not in any immediate danger. I'm going to give you something for the pain, but I need to you stay still until we can splint your leg. All right?”

She was beautiful, in a severe way. Her dark cheeks had dots of pure black scattered across them like beads in a veil. Threads of white laced the

black waves of her hair like moonlight on water. Only there was no moonlight on New Terra. Only billions of strange stars.

“All right?” the woman asked again.

“All right,” Elvi said.

“Tell me what you just agreed to.”

“I don’t remember.”

The woman leaned back, her hand pressing gently against Elvi’s shoulder.

“Torre! I’m going to need a scan on this one’s head. She may be concussed.”

Another voice—a man’s—came from the darkness. “Yes, Doctor Merton. Soon as I’m done with this one.”

Doctor Merton turned back to her. “If I get up right now, are you going to stay where you are until Torre gets here?”

“No, it’s all right. I can come help,” Elvi said.

“I’m sure you can,” the beautiful woman said with a sigh. “Let’s just wait for him, then.”

A shadow loomed up from the darkness. She recognized Fayez by the way he walked. “Go ahead. I’ll sit with her.”

“Thank you,” Doctor Merton said, and then vanished. Fayez lowered himself to the ground with a grunt and crossed his legs. His hair stood out from his slightly oversized head at all angles. His lips were pressed thin. Elvi took his hand without intending to, and she felt him pull back for a second before permitting her fingers to stay touching his.

“What happened?” she asked.

“The landing pad blew up.”

“Oh,” she said. And then, “Do they do that?”

“No. No, they really don’t.”

She tried to think through that. *If they don’t, then how could it have happened?* Her mind was clearing enough for her to notice how compromised she was. Unnerving, but probably a good sign.

“How bad is it?”

She felt Fayez’s shrug more than saw it. “Bad. Only significant good news is that the village is close, and their doctor’s competent. Trained on Ganymede. Now, if our supplies weren’t all on fire or smashed under a couple tons of metal and ceramics, she might be able to do something.”

“The workgroup?”

“I saw Gregorio. He’s all right. Eric’s dead. I don’t know what happened to Sophie, but I’ll go look some more once they get to you.”

Eric was dead. Minutes before, he’d been in the couch beside her, trying to flirt and being annoying. She didn’t understand it.

“Sudyam?” she asked.

“She’s back on the *Israel*. She’s fine.”

“That’s good then.”

Fayez squeezed her hand and let it go. The air felt cool against her palm where his skin had abandoned it. He looked out over the rows of bodies toward the wreckage of the shuttle. It was so dark, she could hardly make him out except where he blotted out the stars.

“Governor Trying didn’t make it,” he said.

“Didn’t make it?”

“Dead as last week’s rat. We’re not sure who’s in charge of anything now.”

She felt tears forming in her eyes and an ache bloomed in her chest that had nothing to do with her injuries. She recalled the man’s gentle smile, the warmth of his voice. His work was only starting. It was strange that Eric’s death should skip across the surface of her mind like a stone thrown over water and Governor Trying’s should strike so deep.

“I’m so sorry,” she said.

“Yeah, well. We’re on an alien planet a year and a half from home with our initial supplies in toothpick-size splinters, and the odds-on bet for what happened is sabotage by the same people who are presently giving us medical care. Dead’s not good, but at least it’s simple. We may all envy Trying before this is over.”

“You don’t mean that. It’s going to be okay.”

“Elvi?” Fayez said, with a sardonic chuckle. “I believe that it isn’t.”

Chapter Three: Havelock

Hey,” the engineer said blearily from the cell. “Havelock. You’re not still pissed, are you?”

Not my job to be pissed, Williams,” Havelock replied from where he floated beside his desk. The internal security station of the *Edward Israel* was small. Two desks, eight cells, a space as much brig as office. And with the ship in high orbit, the loss of effective gravity made it seem even smaller.

“Look, I know I got out of line, but I’m sober now. You can let me out.”

Havelock checked his hand terminal.

“Another fifty minutes,” he said, “and you’ll be free to go.”

“C’mon, Havelock. Have a heart.”

“It’s policy. Nothing I can do about it.”

Dimitri Havelock had worked security contracts for eight different corporations over thirteen years. Pinkwater, Star Helix, el-Hashem Cooperative, Stone & Sibbets, among others. Even, briefly, Protogen. He’d been in the Belt, on Earth, Mars, and Luna. He’d done long-haul work on supply ships heading from Ganymede to Earth. He’d dealt with everything from riots to intimate violence to drug trafficking to one idiot who’d had a thing for stealing people’s socks. He hadn’t seen everything, but he’d seen a lot. Enough to know he’d probably never see *everything*. And enough to recognize that how he reacted to a crisis was more about the people on his team than with the crisis itself.

When the reactor had gone on Aten Base, his partner and supervisor had both panicked, and Havelock remembered the overwhelming fear in his own gut. When the riots had started on Ceres after the ice hauler

Canterbury had been destroyed, his partner had been more weary than fearful, and Havelock had faced the situation with the same grim resignation. When the *Ebisu* had been quarantined for nipahvirus, his boss had been energized—almost elated—running the ship like a puzzle that had to be solved, and Havelock had been caught up in the pleasure of doing an important thing well.

Humans, Havelock knew from long experience, were first and foremost social animals, and he himself was profoundly human. It was more romantic—hell, more masculine—to pretend he was an island, unaffected by the waves of emotion around him. But it wasn't true, and he'd made his peace with that fact.

When the word came that the heavy shuttle's landing pad had exploded and the reports of casualties started coming in, Murtry's response had been an efficient and focused rage, and so Havelock's had been too. All the activity was on the planetary surface, so the only outlet had been on the *Edward Israel* itself. And how things went on the *Israel* were firmly in Havelock's wheelhouse.

"Please?" Williams whined from the cell. "I need to get some clean clothes. It's not going to make any difference, is it? A few minutes?"

"If it's not going to make any difference, it won't matter if you see it through," Havelock said. "Forty-five minutes, and you're on your way. Just sit back and try to enjoy them."

"Can't sit back when you're floating in orbit."

"It's a metaphor. Don't be a literalist."

The *Edward Israel* assignment had been a great contract. Royal Charter Energy was the first real expedition out into the new systems that the rings had opened up, and the importance the company put on the mission's success were reflected in the size of the benefit package they were willing to put together. Every day on the *Israel* had been paid a hazard bonus, even when they were just loading on supplies and crew from Luna. And with almost a year and a half out, a six-year stretch before the scheduled return to Earth, and another eighteen months back—all at full pay—it was almost less a contract than a career plan.

And still, Havelock had hesitated before he signed up.

He'd seen the footage from Eros and Ganymede, the bloodbath in the so-called slow zone when the alien defenses had stopped the ships suddenly

enough to slaughter a third of the people in them. With the massive density of scientists and engineers packed into the *Israel*, it was impossible to forget that they were going into the unknown. Here there be monsters.

And now Governor Trying was dead. Severn Astrapani, the statistician who'd sung Ryu-pop classics in the talent competition, was dead. Amanda Chu, who'd flirted with Havelock one time when they were both a little tipsy, was dead. Half the men and women on the first team were injured. The supplies on the heavy shuttle—and the heavy shuttle itself—were gone. And the quiet that came over the *Edward Israel* was like the moment of shock between the impact of a blow and the pain. And then the rage and the grief. Not only the crew's. Havelock's too.

His hand terminal chimed. The message was tagged for security services. Murtry, Wei, Trajan, Smith, and himself. Havelock opened it with a sense of pleasure. He might be the least senior person in the room, but he was still in the room. Being included made him feel like maybe he'd have some control over events after all. It was an illusion, but that didn't bother him. He took in the message quickly, nodded to himself, and keyed the release code for the cell.

"You're in luck," he said. "I've got a meeting I have to be at."

Williams pulled himself out of the cell. His salt-and-pepper hair was disarrayed and his skin looked grayer than usual. "Thank you," he said sullenly.

"Just don't do that again," Havelock said. "Things are going to be hard enough without people who should know better making it worse."

"I was just drunk," the engineer said. "I didn't mean anything by it."

"I know," Havelock said. "Just don't let it happen again. All right?"

Williams nodded, not making eye contact, then pulled himself along the handholds and launched himself up the tube toward the crew quarters and clothes that weren't ripped or stained with vomit. Havelock waited until he'd gone, then shut down the security station and headed toward the meeting room.

Murtry was already there. He was a small man, but with an energy that seemed to radiate from him like heat. Havelock knew that the security chief had worked corporate prisons and high-end industrial security his whole career. Between that and the simple fact that he'd been put in charge of the *Israel*, he didn't have to work for respect from the team. Floating beside

him, information specialist Chandra Wei and ground operations second Hassan Smith looked serious and grim.

“Havelock,” Murtry said.

“Sir.” Havelock nodded back, taking hold of a handhold and turning himself so that his head was in the same basic orientation as everyone else’s. A few seconds later, Reeve, Murtry’s second, floated in.

Murtry nodded. “Close the door, Reeve.”

“Trajan?” Wei asked, but from the bleak sound of her voice, she already suspected the answer.

“Trajan died in the shuttle,” Murtry said. “Smith? You’re getting promoted.”

“Sorry to hear that, sir,” Smith said. “Trajan was a good officer, and a professional. She’ll be missed.”

“Yeah,” Murtry said. “So we’re here to talk about the response plan.”

“Drop a rock on the squatters?” Wei said, her voice joking in a way that had nothing to do with humor. Murtry smiled anyway.

“We’re going to play it a little more by the book for now,” Murtry said. “Besides, we still have people down there. I’ve sent back to the home office, and I’ve asked for latitude in how we engage the issue. I’m fairly sure, given the circumstances, we’ll have cover from them if it comes to that.”

“We’re a year and a half from anywhere,” Wei said. The implication—*No one can stop us from doing anything we choose*—hung in the air.

“We’re also hours away from every screen and newsfeed from Earth to Neptune,” Reeve said. “This sucks, but we’ve got the moral high ground. If we overreact, it’ll be another round of the evil corporations oppressing the poor Belters. We’re in a post-Protogen world. We don’t win that.”

“Didn’t know they’d made you political officer,” Wei said, and Reeve’s jaw went tight. When Murtry spoke, his voice was calm and level and threatening as a rattlesnake.

“That. We’re not doing that.”

“Sir?” Reeve said.

“The thing where we start sniping at each other. We don’t do that here.”

Wei and Reeve looked at each other.

“I’m sorry, sir,” Wei said. “I was out of line.”

“Not a problem, because it’s not going to happen again,” Murtry said.

“What action have we seen from the *Barbapiccola*?”

“Nothing,” Wei said. “The Belters sent condolences and offers of aid, as if there was a damn thing they could do.”

“Are they warming up the engines?”

“Not that I can tell,” Wei said.

“We’re keeping an eye on that,” Murtry said. It was a statement and a question.

“We could take custody of the ship,” Wei said. “It was Mao-Kwikowski before they got broken up. Its salvage status is very murky. Call it illegal, put a few people on her, and we could shut her down.”

“Noted,” Murtry said. “How is the crew, Havelock?”

“Shocked, sir. Scared. Angry. They’re scientists. They looked on the squatters as an annoyance and a threat to their data. For most of them, this is outside their experience.”

Murtry stroked his chin with the back of his hand. “What are they going to do about it?”

“So far? Get drunk. Yell at each other or at us. Design theoretical judicial systems. Most of them seem to want the whole thing to just go away so they can get on with their research.”

Murtry chuckled. “God bless the eggheads. All right.”

“We still have the two light atmospheric shuttles,” Havelock went on. “I can get pilots for them, and we can evacuate the people we have on the ground.”

“No evac. The squatters don’t get to win this,” Murtry said. “No one that goes down there comes back up. We put more people down there to support them. Whatever their research is, we make damned sure it’s moving forward and everyone down there *sees* it’s moving forward.”

“Yes, sir,” Havelock said, feeling vaguely embarrassed.

“Reeve, you’re going down. Deal with the locals. Find out what you can. Keep our people safe. We want a show of force.”

“But nothing strong enough they can use it for sympathy on the newsfeeds back home,” Reeve said as if he were agreeing.

“Wei, I want your eyes on the enemy ship. If it starts warming up its drive, I want to know.”

“Permission to put my comm laser upgrade into effect?”

The *Edward Israel* didn’t have torpedo tubes or gauss guns. The closest

they had to a weapon was an ancient comm laser that could be hacked to cutting strength. The ship had been designed when the dangers of space were all about radiation and air supply, not intentional violence. It was almost quaint.

“No,” Murtry said. “Just monitor what they’re doing, listen to the chatter, and bring it back to me. If someone needs to make the call, that’s me. No initiative. Understood?”

“Yes, sir.”

“Havelock, you’re going to be up here coordinating with the team on the ground. Use the shuttles however they need to be used to get personnel and materials down to the surface. We’re here to establish a base. We’ll start establishing it.”

“And if there’s another attack, sir?” Wei asked.

“Then that’s a decision the squatters will have made, and we’ll respect their choice,” Murtry said.

“I’m not sure what you mean, sir,” she said.

Murtry’s smile didn’t reach his eyes. “There’s a dignity in consequences.”

Havelock’s quarters were only slightly larger than the cells in the brig, but much more comfortable. He was webbed into his crash couch at the end of his shift when a soft knock came at the door and Murtry pulled himself in. The security chief was scowling, but no more so than usual.

“Anything up, chief?” Havelock asked.

“You’ve worked with Belters,” Murtry said. “What do you think of ’em?”

“They’re people,” Havelock said. “Some are better than others. I still have friends on Ceres.”

“Fine. But what do you *think* of Belters?”

Havelock shifted, the motion setting him drifting up against his restraints as he thought. “They’re insular. Tribal, almost. I think what they have most in common is that they don’t like inner planet types. A Martian can sometimes pass, though. They have the whole low-g physiology thing.”

“So mostly they hate Earthers,” Murtry said.

“That’s what pulls them together. That thing where they’re oppressed by Earth is just about the one thing they have in common. So they cultivate it. Hating people like us is what makes them them.”

Murtry nodded. “You know there are people that would call you prejudiced for saying that.”

“It’s only prejudice when you haven’t been there,” Havelock said. “I was on Ceres Station just before it broke for the OPA. For me, it’s all lived experience.”

“Well, I think you’re right,” Murtry said. “That’s why I wanted to talk to you. Off the record. Most of the people we’ve got on the ship are Earthers or at least Martian. But there are a few Belt types. Like that mechanical tech. What’s his name?”

“Bischen?”

“Him. Just keep an eye on those ones.”

“Is there something going on?”

“Just that the squatters are mostly Belt and outer planets, and the RCE is an Earth company. I don’t want anyone getting their loyalties confused.”

“Yes, sir,” Havelock said. And then, more tentatively, “Is something happening, sir?”

“Not right away. But... well, you might as well know. I’ve had word from the home office. My request for latitude was respectfully declined. Apparently there’s some politicking about how this gets handled. The OPA and the UN are talking about what they want to have happen. Want to make sure the squatters are treated well.”

Murtry’s anger was understated but profound, and Havelock found himself resonating with it.

“But we have the charter. We have a right to be here.”

“We do.”

“And we aren’t the ones who started killing people.”

“We’re not.”

“So what are we supposed to do? Sit on our hands while the Belters kill us and take our things?”

“The sale of the lithium from their illegal mining operations has been frozen,” Murtry said. “And we are instructed not to do anything to incite further conflict.”

“That’s bullshit. How are we supposed to do our work if we’re being all

careful not to offend the bastards who are shooting at us?”

Murtry’s shrug was an agreement. When he spoke, his calm, laconic tone barely covered his contempt.

“Apparently they’re sending us a mediator.”

OceanofPDF.com

Interlude: The Investigator

—it reaches out it reaches out it reaches out it reaches out—

One hundred and thirteen times a second, nothing answers and it reaches out. It is not conscious, though parts of it are. There are structures within it that were once separate organisms; aboriginal, evolved, and complex. It is designed to improvise, to use what is there and then move on. Good enough is good enough, and so the artifacts are ignored or adapted. The conscious parts try to make sense of the reaching out. Try to interpret it.

One imagines an insect's leg twitching twitching twitching. One hears a spark closing a gap, the ticking so fast it becomes a drone. Another, oblivious, reexperiences her flesh falling from her bones, the nausea and fear, and begs for death as she has for years now. Her name is Maria. It does not let her die. It does not comfort her. It is unaware of her because it is unaware.

But unaware is not inactive. It finds power where it can, nestled in a bath of low radiation. Tiny structures, smaller than atoms, harvest the energy of the fast-moving particles that pass through it. Subatomic windmills. It eats the void and it reaches out it reaches out it reaches out.

In the artifacts that are conscious, memories of vanished lives still flicker. Tissues that were changed without dying hold the moment that a boy heard his sister was leaving home. They hold multiplication tables. They hold images of sexuality and violence and beauty. They hold the memories of flesh that no longer exists. They hold metaphors: mitochondria, starfish, Hitler's-brain-in-a-jar, hell realm. They dream. Structures that were neurons twitch and loop and burn and dream. Images and words and pain and fear, endless. An overwhelming sense of illness. An old man's remembered voice whispering dry words that it is unaware of.

Full fathom five thy father lies. Of his bones are coral made.

If there had been a reply, it could end. If there had been anyone to answer, it would have come to rest like a marble at the bottom of a hill, but nothing answers. The scars know that no answer will ever come, but the reflex triggers the reflex triggers the reflex and it reaches out.

It has solved a billion small puzzles already in cascades of reflex. It has no memory of having done so, except in its scars. There is only reaching out, delivering the message that its task is complete. Nothing answers, and so it cannot end. It reaches out. It is a complex mechanism for solving puzzles using what there is to be used.

Those are pearls that were his eyes.

And so it has the investigator.

Of all the scars, there is one that came last. That is most intact. It is useful and so it is used. It builds the investigator from that template, unaware that it is doing so, and tries another way of reaching out. And something answers. Something wrong and foreign and aboriginal, but there is an answer, so over the course of years it builds the investigator again and reaches out. The investigator becomes more complex.

It will not stop until it makes that final connection, and it will never make that final connection. It stretches, tries new combinations, different ways to reach out, unaware that it is doing so. Unaware that it exists. Empty, except in the insignificant parts.

The insectile leg will twitch forever. The scar that wails for death will wail forever. The investigator will search forever. The low voice will mutter forever.

Nothing of him doth fade but suffers a sea change

Into something rich and strange.

It reaches out.

Chapter Four: Holden

MCRN *Sally Ride*, this is independent vessel *Rocinante*, requesting permission to pass through the Ring with one ship. OPA heavy freighter *Callisto's Dream*."

"Transmit authorization code now, *Rocinante*."

"Transmitting." Holden tapped the screen to send the codes and stretched out his arms and legs, letting the motion pull him out of his chair in the microgravity. Several abused joints at various places on his skeleton responded with popping sounds.

"You're getting old," Miller said. The detective stood in a rumpled gray suit and porkpie hat a few meters away, his feet on the deck as though there were gravity. The smarter the Miller simulation had gotten—and over the last two years it had become damned near coherent—the less it seemed to care about matching the reality around it.

"You're not."

"Of my bones are coral made," the ghost said as if in agreement. "It's all about the trade-offs."

When the *Sally Ride* sent the go-ahead code, Alex took them through the Ring nice and slow, the *Callisto* matching speed and course. The stars vanished as the ship moved into the black nothingness of the hub. Miller flickered as they passed through the gate, started to resolidify, and vanished in a puff of blue fireflies as the deck hatch banged open and Amos pulled himself through.

"We landing?" the mechanic asked without preamble.

"No need on this trip," Holden said, and opened a channel to Alex up in the cockpit. "Keep us here until we see the *Callisto* dock, then take us back

out.”

“Sure could use a few days station-side, chief,” Amos said, pulling himself over to one of the ops stations and belting in. His gray coverall had a scorch mark on the sleeve, and he had a bandage covering half of his left hand. Holden pointed at it. Amos shrugged.

“We’ve got a pair of soil ships waiting at Tycho Station,” Holden said.

“No one’s had the balls to try and rip off any of the ships on this route. This many navy ships hanging around? It’d be suicide.”

“And yet Fred pays us very well to escort his ships out to Medina Station, and I like taking his money.” Holden panned the ship’s telescopes around, zooming in on the rings. “And I don’t like being in here any longer than necessary.”

Miller’s ghost was an artifact of the alien technology that had created the gates and a dead man. It had been following Holden around for the two years since they’d deactivated the Ring Station. It spent its time demanding, asking, and cajoling Holden to go through the newly opened gates to begin its investigation on the planets beyond them. The fact that Miller could only appear to Holden when he was alone—and on a ship the size of the *Rocinante* he was almost never alone—had kept him sane.

Alex floated down from the cockpit, his thinning black hair sticking out in every direction from his brown scalp. There were dark circles under his eyes. “We’re not landin’? Could really use a couple days station-side.”

“See?” Amos said.

Before Holden could reply, Naomi came up through the deck hatch. “Aren’t we going to dock?”

“Captain wants to rush back for those soil transports at Tycho,” Amos said, his voice somehow managing to be neutral and mocking at the same time.

“I could really use a few days—” Naomi started.

“I promise we’ll take a week on Tycho when we get back. I just don’t want to spend my vacation time, you know”—he pointed at the viewscreens around them displaying the dead sphere of the Ring Station and the glittering gates—“here.”

“Chicken,” Naomi said.

“Yep.”

The comm station flashed an incoming tightbeam alert at them. Amos,

who was closest, tapped the screen.

“*Rocinante* here,” he said.

“*Rocinante*,” a familiar voice replied. “Medina Station here.”

“Fred,” Holden said with a sigh. “Problem?”

“You guys aren’t landing? I’m betting you could use a few—”

“Can I help you with something?” Holden said over the top of him.

“Yeah, you can. Call me after you’ve docked. I have business to discuss.”

“Dammit,” Holden said after he’d killed the connection. “You ever get the sense that the universe is out to get you?”

“Sometimes I get the sense that the universe is out to get *you*,” Amos said with a grin. “It’s fun to watch.”

“They changed the name again,” Alex said, zooming in on the spinning station that had until recently been called *Behemoth*. “Medina Station. Good name for it.”

“Doesn’t that mean ‘fortress’?” Naomi said with a frown. “Too martial, maybe.”

“Naw,” Alex said. “Well, sort of. It was the walled part of a city. But it sort of became the social center too. Narrow streets designed to keep invaders out also kept motorized traffic or horse-drawn carts out. So you could only get around by walkin’. So the street vendors gathered there. It turned into the place to shop and congregate and drink tea. It’s a safe place where people gather. Good name for the station.”

“You’ve put a lot of thought into this,” Holden said.

Alex shrugged. “It’s interestin’, the evolution of that ship and its names. Started out as the *Nauvoo*. A place of refuge, right? Big city in space. Became the *Behemoth*, the biggest baddest warship in the system. Now it’s Medina Station. A gathering place. Same ship, three different names, three different things.”

“Same ship,” Holden said, feeling a little surly as he instructed the *Rocinante* to begin the docking approach.

“Names matter, boss,” Amos said after a moment, a strange look on his big face. “Names change everything.”

The interior of Medina Station was a work in progress. Large sections of the central rotating drum had been covered with transplanted soil in preparation for food production, but in many places the metal and ceramic of the drum was still visible. Most of the damage the former colony ship had sustained during her battles had been cleaned up and repaired. The office and storage space in the walls of the drum was becoming the hub of efforts to explore the thousand new worlds that had opened up to humanity. If Fred Johnson, former Earth colonel and now head of the respectable wing of the OPA, was positioning Medina Station as the logical location for a fledgling League of Planets-type government, he at least had the good sense not to say it out loud.

Holden had watched too many people dying there to ever see it as anything but a graveyard. Which made it pretty much the same as any other government he could think of.

Fred had set up his new office in what had once been the colonial administration building back when Medina Station was still called the *Nauvoo*. They'd also been used as the offices of Radio Free Slow Zone. Now they were patched up, repainted, and decorated with atmosphere-renewing plants and video screens of the Ring space around the ship. To Holden it made for an odd juxtaposition. Sure, humans had invaded an extra-dimensional space with wormholes to points scattered across the galaxy, but they'd remembered to bring ferns.

Fred puttered around the office making coffee.

"Black, right?"

"Yep," Holden said, and accepted the steaming cup from him. "I don't like coming here."

"I understand. I appreciate you doing it anyway," Fred said and collapsed into his chair with a sigh that seemed excessive in the one-third g of the station's spin. But then the pressures pushing down on Fred had little to do with gravity. The five years since Holden had met him hadn't treated the man kindly. His formerly salt-and-pepper hair had gone entirely gray, and his dark skin was lined with tiny wrinkles.

"No sign it's waking up?" Holden said, pointing his coffee cup toward a wall screen that was displaying a blown-up image of the spherical Ring Station.

"I need to show you something," Fred said, as though Holden hadn't

asked the question. At Holden's nod, Fred tapped on his desk and the video screen behind him came to life. On it, Chrisjen Avasarala's face was frozen mid-word. The undersecretary of executive administration had her eyes at half-mast and her lips in a sneer. "This is the part that concerns you."

"—eally just an excuse to wave their cocks at each other," Avasarala said when the video started. "So I'm thinking we send Holden."

"Send Holden?" Holden said, but the video kept playing and Fred didn't answer him. "Send Holden where? Where are we sending Holden?"

"He's close when he's out at Medina, and everybody hates him equally, so we can argue he's impartial. He's got ties to you, Mars, me. He's a fucking awful choice for a diplomatic mission, so it makes him perfect. Brief him, tell him the UN will pay for his time at double the usual rates, and get him on New Terra as fast as possible before this thing gets fucked up any worse than it already is."

The old lady leaned in toward the camera, her face swelling on the screen until Holden could see the fine detail of every wrinkle and blemish.

"If Fred is showing this to you, Holden, know that your home planet appreciates your service. Also try not to put your dick in this. It's fucked enough already."

Fred stopped the recording and leaned back in his chair. "So..."

"What the hell is she talking about?" Holden said. "What's New Terra?"

"New Terra is the unimaginative name they gave to the first of the explored worlds in the gate network."

"No, I thought that was Ilus."

"Ilus," Fred said with a sigh, "is the name the Belters who landed there gave it. Royal Charter Energy, the corporation with the contract to do the initial exploration, call it New Terra."

"Can they do that? People already live there. Everyone calls it Ilus."

"Everyone *here* calls it Ilus. You see the problem," Fred said. He took a long sip of his coffee, buying himself time to think. "No one was ready for this. A shipful of Ganymede refugees commandeered a Mao-Kwik heavy freighter and blew through the Ring at high speed as soon as the first probe results came out. Before we'd had time to pick up the pieces from our initial incursion. Before the military blockade. Before Medina was ready to enforce a safe speed limit in the Ring space. They came through so fast we didn't even have time to hail them."

“Let me guess,” Holden said. “The Ilus Gate is on the opposite side from the Sol Gate.”

“Not quite. They were smart enough to come in at an angle to avoid slamming into the Ring Station at three hundred thousand kph.”

“So they’ve been living on Ilus for a year, and suddenly RCE shows up and tells them that, oops, it’s really *their* planet?”

“RCE has the UN charter for scientific exploration on Ilus, New Terra, whatever you want to call it. And they’re there *because* the Ganymede refugees landed there first. The plan was to study these worlds for years before anyone lived on them.”

Something in Fred’s tone of voice tickled at Holden’s mind for a second, and he said, “Wait. UN charter? When did the UN get to be in charge of the thousand worlds?”

Fred smiled without humor. “The situation is complex. We have the UN making a power grab to administrate all these new worlds. We have OPA citizens settling one without permission. We have an energy company getting the exploration contract on a world that also just happens to have the richest lithium deposits we’ve ever seen.”

“And we have you,” Holden said, “setting up to run the turnpike everyone has to take to get there.”

“I think it’s safe to say the OPA has fundamental disagreements with the idea that the UN is unilaterally in charge of handing out those contracts.”

“So you and Avasarala are back-channeling this to keep it from turning into something bigger.”

“There are about five more variables than that, but as a start, yes. Which is where you come in,” Fred said, pointing at Holden with his coffee mug. Printed on the side of the mug were the words THE BOSS. Holden stifled a laugh. “Nobody owns you, but Avasarala and I have both worked with you, and think we can do it again.”

“That’s a really stupid reason.”

Fred’s smile gave away nothing. “It doesn’t hurt that you have an atmosphere-rated ship.”

“You know we’ve never actually used it, though, right? I’m not keen on the first in-atmosphere maneuver happening a million kilometers from the closest repair bay.”

“The *Rocinante* is also a military design, and—”

“Forget it. No matter what your coffee cup says, I’m not going to be the boot on the colonists’ neck. I won’t do that.”

Fred sighed, sitting forward. When he spoke, his voice was soft and warm as flannel. But it didn’t hide the steel underneath it.

“The rules governing how a thousand planets are run are about to be made. This is the test case. You’ll be going in as an impartial observer and mediator.”

“Me? As a mediator?”

“The irony’s not lost on me. But things have already started to go bad there, and we need someone keeping it from getting worse while three governments decide how the next one will work.”

“You mean you want me to make it look like you’re doing something while you figure out what to do,” Holden said. “And going bad how?”

“The colonists blew up an RCE heavy lift shuttle. The provisional governor was on it. He’s dead, along with a few scientists and RCE employees. It won’t help our negotiations if Ilus turns into a full-blown war between Belters and a UN corporation.”

“So I keep the peace?”

“You get them talking, and you keep them talking. And you do what you always do, you maintain absolute transparency. This is one time secrets won’t help anyone. Should be right up your alley.”

“I thought I was the galaxy’s biggest loose cannon to you guys. Is Avasarala sending the match in to meet the powder keg because she *wants* this to fail?”

Fred shrugged. “I care less what she wants you for than what I do. Maybe the old lady likes you. Don’t ask me to explain it.”

Miller was waiting for Holden outside Fred’s office.

“There are three thousand people on Medina Station right now,” Holden said. “How is it that not one of them is here to keep you from bugging me?”

“You going to take the job?” Miller said.

“I haven’t decided,” Holden said. “Which, since you are running a simulation of my brain, you already know. So you asking is really you

telling me to take it. Stop me when I'm wrong."

Holden headed off down the corridor, hoping to run into another human and make the Miller ghost go away. Miller followed, his footsteps echoing on the ceramic floor. The fact that those echoes existed only inside Holden's mind made the whole thing even creepier.

"You're not wrong. You should take it," Miller said. "The man's right. It's important. Something like that goes from a few pissed-off locals to a meat grinder without much time in between. This one time, back on Ceres —"

"Okay, no. No folksy cop stories from the dead guy. What's on Ilus that you want?" Holden asked. "It might help if you just came out and told me what it is you want on the other side of those rings."

"You know what I'm looking for," the old detective said. He actually managed to look sad.

"Yeah, whatever weird alien civilization made you. And I already know you won't find it. Hell, *you* know you won't find it."

"Still gotta loo—" Miller vanished. A woman in a blue Medina Station security uniform walked by, looking at her hand terminal. She grunted something approximating a greeting without looking up.

Holden took the stairs up to the inner surface of Medina's rotating habitation drum. No chance Miller would surprise him there. The drum was full of activity, with some workers spreading imported soil for the eventual farms and others raising prefab buildings that would be houses and storage. Holden waved cheerily at them as he walked past. With his increasingly frequent Miller hauntings, he had come to appreciate the value of having other humans within line of sight. They made his life a little less weird just by existing.

He avoided the elevator to the engineering transition point that would take him out of the rotating drum and into the microgravity of the stern of the former colony ship. The *Rocinante* was docked at the airlock there. Instead, he walked up the long curling ramp that kept him in sight of everyone in the rotating drum. The last time he'd climbed that ramp, people had been shooting and dying all around him. It wasn't a pleasant memory, but it was better than being trapped alone in an elevator car with Miller. The universe was getting a little thick with his personal history.

Before he passed through the transition point and into the engineering

decks, he floated for a moment and looked out across the inside of the habitation drum. From his elevation the plots of soil looked like checkerboard squares of dark brown against the gray of the drum's skin. Equipment moved across them like metal insects, busy at unguessable tasks. Turning a bubble of metal into a tiny self-contained world.

We'll forget how to do this, Holden thought. Humanity had only just started learning how to live in space, and now they'd forget. Why develop new strategies for surviving on tiny stations like Medina when there were a thousand new worlds to conquer, with air and water free for the taking? It was an astounding thought, but it also left Holden just a little melancholy.

He turned his back on the workers busy at their obsolete work, and returned to his ship.

"So," Naomi said as the crew sat together in the *Rocinante's* galley. "Are we going to Ilus?"

Holden had spent several minutes explaining what Fred Johnson and Chrisjen Avasarala wanted from them, and then just sort of trailed off. The truth was he didn't know the answer to Naomi's question.

"There are a lot of reasons to do this," he finally said, tapping out a quick rhythm on the metal tabletop. "It is a really big deal. It's the test case for a thousand worlds to follow. And I admit there's some attraction to the idea that we'd get to help set the perspectives. Maybe get to help create the template for everything that follows. That's pretty damn exciting."

"And the money's good," Amos said. "Don't forget the money's good."

"But," Naomi prompted, putting her hand on his arm and smiling. Letting him know it was okay to share whatever his fears were. He smiled back and patted her hand.

"But I have one pretty compelling reason to say no," he said. "Miller really wants me to go."

They were silent for a long moment. Naomi was the first to speak.

"You're going to take it."

"Am I?"

"You are," she said. "Because you think you'll be able to help."

"You think we can't?"

“No,” Naomi said. “I think you can. And even if we’re wrong, not trying would make you cranky.”

“Other thing to consider?” Amos said. “Money’s really good.”

Chapter Five: Basia

Jesus wept, Basia my child,” Coop said. “We’re *winning*. How much of a sister are you turning into if it gets rocky?”

The others all looked at him, waiting. Scotty and Pete, but also Loris and Catherine. Ibrahim and Zadie. Basia crossed his arms.

“They find out who killed their governor—” Basia began, but Coop waved a hand like shooing flies.

“Won’t. If they haven’t now, it’s just going down as one of those things that happened. Hell, I don’t remember who did it. You remember, Zadie?”

Zadie shook her head. “Ne savvy mé,” she said like the Belter that she was. That she’d been before. Coop gestured toward her like he’d proved a point.

“I don’t like how it came out either,” Pete said. “But if we hadn’t done it, they’d have been here this whole time instead of just dribs and drabs. Holden’d be here with a domed city already up, and then what would we be looking at?”

“Exactly,” Coop said. “Slow them down, we wanted, and slow them down we did. Question now is what to do with the time we’ve got left.”

“Could kill them all and drop their bodies down the mine pits,” Loris said, her smile making it clear that she was mostly joking.

“I was thinking we could pooch their transmitter,” Ibrahim said. “All their signal goes through one repeater in their technical hut. Something happened to that, they’d be choked for bandwidth like the rest of us.”

“Would it take their hand terminals down too?” Coop asked.

“Might,” Ibrahim said. “It would certainly make them local and line of sight.”

“Worth considering,” Coop said.

The ruins where they met were a half hour’s fast walk from the town itself. Great towers of strange, bonelike material rose up out of the ground, leaning against one another in patterns that seemed almost random until he caught them at just the correct angle and some ornate symmetry revealed itself. The lower structures were soft at the edges, curved like vertebrae or the gears of some unimaginably nimble machine.

A soft breeze shifted through the ruins with a sound like reed flutes playing in the distance. Something had lived here once, but it was gone now, and its bones were a hiding place for Basia and his cabal. He had the sudden memory of a video he’d seen once of brine shrimp living in the bones of a dead whale.

“Question I have,” Basia said, “is what we’re aiming for. We knock out their bandwidth. What does that get us?”

“Makes it harder for them to show value,” Loris said. “I’ve read the charter same as everyone else. Yes, it’s got a lot of conservation and basic science riders and requirements, but let’s all be clear. RCE is here to make a profit. If we can make it clear that they won’t be able to...”

“That doesn’t matter,” Ibrahim said. “What we need to do is establish our own claim to the planet. Profit and loss comes later.”

“I don’t agree, Bram,” Loris said. “If you look at the history of colonialism, legal precedent and title claims are almost always rationalized after the fact. What you see is—”

“What I see,” Coop cut in, “is the time until the joint OPA/UN observer gets here and changes the game getting shorter. Basia? You want to weigh in?”

Basia cracked his knuckles. “What he needs to see is that RCE isn’t organized and we’ve got a ship full of refined lithium ready for market.”

“So let’s make that happen,” Coop said, smiling his vicious smile.

After the meeting, they left one by one or in pairs, so as not to attract attention. First Pete and Ibrahim, together because they were lovers. Then Scotty, puffing on his pipe. Loris and Caterine. Then, usually, Zadie and Coop. But not today. Today, Coop nodded Zadie on ahead. She made the one-handed nod, the physical idiom of Belters who had to communicate in vacuum suits, and strode out, her too-long limbs giving her a gait that was awkward and graceful at once. Like a giraffe.

“Having a hard time with this, you,” Coop said.

Basia shrugged. “Got off to a bad start. That’s all.”

“You were one of them before. Didn’t fight,” Coop said.

“Didn’t,” he said bitterly.

They had lived together on the ship with all the others for years after Ganymede. They had argued together, the two of them, for the exodus to the new planets that the ring gates had opened. Basia knew Coop. Knew he’d fought with a splinter of the OPA that had never accepted compromise with the inner planets. The split circle of the Outer Planets Alliance was etched in the man’s skin, just over his left shoulder blade. It occurred to Basia, not for the first time, that *outer planets* had taken on a very new meaning in the last couple years.

“Can be hard,” Coop said. “Especially on the big stations. Ceres. Eros, before. Ganymede. All kind of inners there. You live around them. Work with them. Come to like some of them maybe. And then the order comes, and you have to pop a seal and let someone die. Can’t pass, because then they can start looking for the pattern. Who lived that shouldn’t. Compromises the cell.”

Basia nodded, but his mouth tasted sour. “That what we are? An OPA cell?”

“Resisting Earth’s corporate power grab, ne? There’s worse models.”

“Yeah,” Basia said. “I get your point.”

“You do? Because what I’m seeing is you putting a lot of questions in a lot of heads. Thinking about whether we’re on the path we should be.”

Basia bristled. “That a problem for you?”

“Problem’s for you, mate. Because the more you wonder, the more they wonder. And no matter what I pretend, we all remember who mashed that button.”

The walk back from the meetings always left Basia upset. Everywhere, there were little reminders of what the group of them—his cell—had done and also what they hadn’t. The little hydrology lab down by the wash with its geodesic dome and its drills, like the mining pits in miniature. The exobiologists’ hut out alone on the edge of the township. The unfamiliar

faces in the square, the clothing that had been fabricated with RCE templates.

On the flats north of the town, a soccer game was kicking up dust, townsmen including his own son Jacek playing with the corporation's people. At least they were still on different teams. Basia looped around, entering the town proper on the path that led to the mining pits. The breeze was rising toward a wind, stirring dust devils. High above in the blue arc of sky, a wedge of vast creatures like aerial jellyfish trailed golden streamers from pale white bodies. Lucia said each one was as large as the ship, but he couldn't bring himself to believe that. He wondered whether anyone had given the creatures a name.

"Basia!"

"Carol," he said with a nod as the big woman fell in step beside him. Carol Chiwewe had been everyone's first choice for coordinator when they'd landed. Smart and focused and strong-minded without being bullish. She almost certainly guessed that he was involved in what had happened at the landing pad, but it didn't matter. Some secrets stayed secrets because nobody knew them. Some because nobody told.

"I'm putting together a maintenance crew to head out for the pits. Going out tomorrow. Probably stay for five, six days. You in?"

"There a problem?"

"No, and I think we should keep it that way. Only a few more loads to get up the well before we can ship out."

"Be good to have a full hold before the observer arrives," Basia said.

"Wouldn't it just," Carol said with a smile. "Glad you're in. Meet at the square at nine."

"Okay," Basia said, and she clapped him on the shoulder, turning back to whatever errand she'd been on when she saw him. It was another twenty minutes before he noticed that he hadn't ever exactly said yes. That was why she ran things, he figured.

His own home was near the edge of the town. They'd made the bricks from the local earth, processed through some of the mining equipment and fired in a kiln powered by combustion. It could only have been more primitive if they'd dug a cave and painted bison on the walls. Lucia was on the little porch area, sweeping the bricks with a broom made from a local grass analog that smelled like manure and peppermint and turned from

black to gold when you cut it.

“You don’t know what that thing’s off-gassing,” he said. It was a little joke between them. How she answered would tell a lot about where they stood. A litmus test for the pH of his marriage.

“A third of it’s carcinogenic, a third’s mutagenic, and a third we don’t know what it does,” she said with a smile. So things were good. Basia felt a knot loosen in his belly. He kissed her cheek and ducked into the cool of the house.

“You might as well stop that,” he said. “Wind is just going to push it back.”

Lucia made a few more desultory passes, the grass hissing against the brick, then followed him in. By the standards of Ganymede or the ship, the house was massive. A sleeping room for each of the children and a shared one for them. A room dedicated entirely to food preparation. The captain’s suite on the *Barbapiccola* boasted fewer square meters than Basia’s home. It was a barbarian palace, and it was his. He sat on a chair by the front window and looked out at the plain.

“Where’s Felcia?” he asked.

“Out,” Lucia said.

“You sound just like her.”

“Felcia is my primary source of information about Felcia,” Lucia said. She was smiling. Laughing a little, even. It was as good a mood as she’d been in for weeks. Basia knew it was a choice. She needed him in a good mood for something, and if he was wise, he’d fight against the manipulation. He didn’t want to, though. He wanted to be able to act for a while as if everything were fine. And so he played along.

“I blame your side of the family. I was always very compliant as a boy. Do we have anything worth eating?”

“More ship’s rations.”

Basia sighed. “No salad?”

“Soon,” she said. “The new crop is doing well. As long as we don’t find anything strange in them, you’ll be able to have all the carrots you want starting next week.”

“Someday we’ll be able to grow in the soil here.”

“Maybe north of here,” Lucia said, and rested her hand on his shoulder as she looked out the window with him. “Even the native fauna have a hard

time around here.”

“North. South. Ilus is all *here* as far as I’m concerned.”

She turned, walking to the kitchen. Basia felt a tug of longing for her, a nostalgia of the body that belonged to a time when they’d been younger, childless, and horny all the time. He heard the pop and hiss of the rations canisters. The smell of sag aloo wafted through the air. Lucia came back in with a palm-sized plate of food for each of them.

“Thank you,” he said.

Lucia nodded and sat in her own chair, her leg curled up under her. Gravity had changed her. The muscles of her arms and shoulders were more pronounced now, the curve of her back when she sat was at a different angle. Ilus was changing them in ways he had never expected, though perhaps he should have. He took a forkful of the sag aloo.

“Going to the mines tomorrow,” he said.

Lucia’s eyebrows rose a fraction. “What for?”

“Maintenance,” he said, and then, because he knew what she was thinking, “Carol asked me.”

“That’s good, then.” Meaning that it was Carol who had asked him to go and not Coop. He felt a stab of shame and then an annoyance that he was ashamed. He pressed his lips together a little more tightly.

“The observer’s coming,” Lucia said, as if she meant nothing by it. “James Holden.”

“I’d heard. It’s good. Gives us leverage against the RCE.”

“I suppose so.”

He could remember a time when they’d laughed together. When Lucia had come from the hospitals on Ganymede full of stories about the patients and the other doctors. They’d eat vat-grown steak as tender as anything harvested from an animal and drink beer fermented there on the little moon. They’d talked for hours, until it was long past time to sleep. Now their conversations were so careful, it was like the words all had glass bones. So he changed the topic.

“It’s strange to think about it,” he said. “I’ll probably never weld in a vacuum again. All those years apprenticing and working, and now everything I do has air around it.”

“Tell me about it. If I’d known how it would all play out, I’d have spent my rotations in the general clinics.”

“Well, you’re the best hand surgeon on the planet.”

“The best hand surgeon on the planet is doing a lot of reading on digestive disorders and gynecological exams,” Lucia said dryly. Her eyes went hard, distant. “We need to talk about Felcia.”

And here it was. The gentleness, the calm, the soft memories. This was where it had been leading. He sat forward, his eyes cast on the ground.

“What’s to say?”

“She’s been talking about what happens next. For her.”

“Same as happens for any of us,” Basia said.

Lucia put another bite in her mouth, chewing slowly, though the food hardly required it. A gust of hard wind pressed in at the window with the soft ticking of grit against the glass. When she spoke, her voice was soft, but implacable.

“She’s thinking of university,” Lucia said. “She’s done the tutorials and examinations on the network. She needs us to give permission before the applications move forward.”

“She’s too young,” Basia said, knowing as the words came out that it was the wrong tack. Frustration knotted his throat and he put his dinner, half eaten, on the armrest.

“She won’t be by the time she gets there,” Lucia said. “If she went with the first shipment and transferred at Medina, she could be on Ganymede or Ceres Station in nineteen months. Twenty.”

“We need her here,” Basia said, his tone hard and definitive. The conversation was over. Except that it wasn’t.

“I don’t regret coming here,” Lucia said. “And you didn’t force me to come. The months after Ganymede when we were all living like rats packed too tight? All the ports that wouldn’t take us in? I remember that. When Mao-Kwikowski was dissolved, I was the one who helped Captain Andrada draw up the salvage papers. I made the *Barbapiccola* our ship.”

“I know.”

“When we took the vote, my voice was with yours. Maybe living so long as refugees made us wild or brave. I don’t know, but to come here. To begin everything again under a sky. Under some new star. I thought it was as obvious as you did, and I don’t regret coming.”

Her tone was fierce now. Her dark eyes glittered and flashed, daring him to disagree. He didn’t.

“If we spend the rest of our lives mining lithium and trying to grow carrots, I will be delighted with that,” she went on. “If I never reattach another ligament or regrow a lost thumb, then fine. Because I chose it. Jacek and Felcia didn’t make that choice.”

“I’m not sending my children back,” Basia said. “What would they get back there? With all the work that needs to be done *here*, with all the things there are to be learned and discovered *here*, how is going backward a good idea?” His voice was getting louder than he’d meant, but he wasn’t shouting. Not really.

“Being here is our choice,” Lucia said. “Felica’s choice is where her choice is. We can stand in the way or we can help.”

“Helping her back into *that* isn’t helping,” Basia said. “She belongs here. We all belong here.”

“Where we came from—”

“We came from here. Nothing that happened before matters. We are from here now. Ilus. I will go down dying before I let them bring their wars and their weapons and their corporations and their science projects here. And I will be damned if they get any more of my children.”

“Dad?”

Jacek stood in the doorway. He had a soccer ball on his hip and an expression of concern in his eyes.

“Son,” Basia said.

The moaning of the wind was the only sound. Basia stood up, took his canister and then Lucia’s. Taking her leavings to the recycler was a small olive branch, but it was all he had. The sense of impotent rage and shame boiled up in his throat and found to release there. Katoa, the landing pad, the concern in Jacek’s eyes. The years they had spent fleeing only to land in a brick palace that his daughter wanted to leave. All of it mixed into a single emasculating anger as hot as solder.

“Is everything okay?” Jacek asked.

“Your mother and I were just talking.”

“We aren’t from here,” Lucia said as if Jacek hadn’t come in, as if the adult conversation could go on with the boy there. “We’re making it that way, but it isn’t true yet.”

“It will be,” Basia said.

OceanofPDF.com

Chapter Six: Elvi

Elvi sat in the high meadow, her legs stretched out before her, and watched quietly. The plant analogs—she couldn't really call them plants—lifted up above the dry, beige soil, straining toward the sunlight. The tallest stood hardly more than half a meter with a flat corrugated top that shifted to follow the sun and glittered the iridescent green of a beetle's carapace. A gentle breeze shifted the stalks and cooled Elvi's cheek. She didn't move. Four meters away, a mimic lizard cooed.

This time, the answering coo was closer. Elvi fought not to bounce with excitement. She wanted to wave her hands in glee, wanted to giggle. She stayed still as a stone. The prey species waddled closer. About the size of a sparrow, it had a soft rill of something like feathers or thick hair that ran down its sides. It had six long, ungainly legs, each ending in a doubled hook. She wanted to see them as fingers or toes, but she hadn't seen any of the little things use the hooks to manipulate anything. It cooed again, a soft guttural chuffing halfway between a dove's call and a tambourine. The mimic lizard waited a moment, its wide-set eyes shifting toward the little animal. Elvi watched for the tremor in the lizard's side, an almost invisible fluttering of its scalelike skin.

With the speed of a gun, the lizard's mouth unhinged and a mass of wet pink flesh shot out. The prey animal didn't so much as squeak as the lizard's inverted stomach drove it to the ground. Elvi's fists wriggled in delight as the mimic lizard began hauling its internal organs back across the dry ground. The prey species was dead or paralyzed, adhering to the pink flesh. Dirt and small stones stuck to the stomach too. Eventually the whole mass reached the mimic lizard's too-wide jaw, and it began the long process

of drawing the messy complex back through its mouth. From her previous observations, Elvi knew it would take the better part of an hour before the mimic lizard's newly concave sides filled out again. She stood up, dusting herself off, and hobbled over.

Her foot was still in the cast she'd gotten on that terrible first night. The pain from the broken bone was only a dull ache now, more an annoyance than a problem, but the cast made mobility an issue. She opened her satchel, the black lattice fabric ticking under her fingers, then gently lifted the feeding lizard into it. Its gaze flickered across her, untrusting. That was fair.

"Sorry, little one," she said. "It's in the name of science."

She closed the satchel and triggered the collection sequence. The lizard died instantly, and the internal assay sequence began, cataloging the gross structures of the animal's body, firing hair-thin needles through the corpse to gather samples at every boundary between tissues and feeding the data up to the dedicated system in the satchel's strap. By the time she got back to her little hut and took the corpses out for storage and cataloging, the mimic lizard and its prey would be modeled in her computer, terabytes of information ready to stream up to the *Edward Israel* and from there back to the labs on Luna. It would take the signal a few hours to travel the distance that had taken her eighteen months, but for those hours, she and her workgroup would be the only people in all the billions of humans scattered throughout the planets who would know this little being's secrets. If God had come and offered her the Library of Alexandria in exchange, she wouldn't have taken the trade.

As she tramped down the gentle slope toward her hut, the mining village spread out before her. It was tiny. Two parallel streets with a gap in the middle that passed for a town square. The buildings were cobbled together from the supplies they'd brought and what they could find on the planetary surface. Everything stood at slightly wrong angles, like a handful of dice had been scattered there. She was used to the strict rectilinear architecture that came from living where space was precious. That didn't apply here, and it made the little town seem more organic, like it had simply grown there.

Fayez was sitting on the small porch outside her hut. His skin had darkened in the weeks since the crash. The preliminary hydrological study had kept him and several of the others from the team out in the field for

almost two weeks.

“You know what I love about this planet?” Fayez said instead of hello.

“Nothing?”

He scowled at her, feigning hurt feelings. “I love the period of rotation. Thirty hours. You can get in a full day’s work, stay up getting drunk at the saloon, and still get a full night’s sleep. I don’t know why we didn’t think of this back home.”

“There are advantages,” Elvi said, unlocking her door and stepping into the hut.

“Of course it means we’ve been here almost six weeks in the past month,” Fayez said, “but thank God we didn’t get one of those little spinning tops with sundown every six hours. Now if they can just fix the gravity.”

The unit was a single four-by-six-meter room with bed, shower, toilet, kitchen, and workstation all hunched together. As she put the satchel into the archiving unit, it struck her how much her work was about inferring things from design. As soon as she’d seen the mimic lizard’s forward-facing eyes, she’d assumed it was a predator. Anyone looking at her hut would know it had been made with the assumption that space would be at a premium. Everything was an artifact of its function. That was what made evolution so gorgeous. She looked in the mirror over her little sink. Her skin was covered in a thin layer of beige dust, like stage makeup.

“I don’t want to do this,” she said, wiping her cheeks with a damp tissue.

“Look on the bright side,” Fayez said. “They’ve only tried to kill us once so far.”

“You aren’t helping.”

“I’m not trying,” he said, then winced at the unintentional reference to the dead man.

They had cremated Governor Trying and the other casualties of the crash. Apart from one villager who’d arrived with non-responsive bone cancer, they had been the first human deaths on the world. Certainly they were the first murders.

But after that, the people from the village had been nothing but kind. Lucia Merton, the doctor who’d come to help them after the crash, had followed up with each of the survivors. A Belter from Ceres named Jordan had brought Elvi food that his wife had cooked for the injured. The holy

man had invited her to the services at the village temple. Everything about the inhabitants of New Terra said that they were kind, gentle, authentic people. Except that someone had killed the governor and almost a dozen others.

The RCE encampment stood south of the village proper.

With Elvi and Fayez included, a little less than half the RCE employees on the surface had chosen to attend the village's community meeting. The others were involved in their work or still too badly injured. If she hadn't felt it was part of her job to educate everyone about the contamination hazards, Elvi would probably have stayed back at her hut too.

Most of the RCE personnel were field scientists. They dressed for comfort, herself included. The only ones in formal clothes were the security team. Hobart Reeve, Murtry's second, led three armed guards in RCE uniforms that made them look like soldiers or police. They hadn't been on the big shuttle, but had arrived on a light shuttle almost immediately. When the order had come in from RCE that no new personnel were going planetside until the UN observer arrived, Reeve had already been investigating what he always called "the incident."

The community hall was one side of the village's central square, set across the bare dirt and stone from the temple. Apart from the collection of religious iconography at the temple's eaves, the two were hard to tell apart.

The chairs were made from industrial cowering and modified crash couches. If the village had been in a more temperate part of the planet, there would have been more local flora, some sort of wood analog, to use. But this was where the lithium was nearest the surface, and lithium was what would bring money to the community. So like a microorganism moving along a concentration gradient, all of humanity had come to these twenty square kilometers.

Elvi sat at the back with the other RCE employees, except Reeve and the security detail, who sat closer to the front with the locals. She watched them all segregate without a word. No one enforced the separation, but it was there. Michaela, an atmospheric physicist, sat beside her with a smile. Anneke and Tor, both geoengineers, sat on her other side, hand in hand. Fayez in the couch beyond her, talking with Sudyam, who had come down with the first small shuttle after the accident. The incident. The attack. Anneke leaned in and murmured something to Tor. He blushed and nodded

a little too vigorously. Elvi tried to ignore the sexual byplay.

The mayor of First Landing was a thick-featured Martian woman with a broad accent and finger-cut hair named Carol Chiwewe, only they called her the coordinator, not the mayor. She called the meeting to order, and Elvi felt her heart starting to beat faster. The Belters had set the agenda, and so it started off with issues that were more important to them than to Elvi or RCE: the maintenance schedule for the water purification systems, whether to accept a credit line from an OPA-backed bank at unfavorable terms or wait until the first load of lithium came back and try for better. Everything was talked about in calm, considered terms. If there was anger or fear or murder, they had buried it so deeply that the mound didn't show.

Reeve's turn came, and he stepped smartly to the front of the room. His lips made a thin, forced smile.

"Thank you, madam coordinator, for inviting us to speak," he said. "We have confirmation that the independent observer is on the way with a commission from the UN, the Martian congress, and the OPA to assist with moving the development of the colony forward. It is our hope to have the security issues addressed before they arrive."

We hope to hang the bad guys on a rope before anyone gets here and says we can't, Fayez translated quietly enough for the words to reach Elvi's ears and no farther.

"We have definitively identified the explosive used in the attack, and we are looking into which individuals had access to it."

We don't have a goddamn clue who did it, and since you hicks store mining explosives in an unlocked shed, we aren't going to figure it out anytime soon.

"I don't have to explain the gravity of this situation, but Royal Charter Energy is committed to the success of this colony for both our employees and this community. We're all in this together, and my door is always open to anyone with questions or concerns, and I hope that we can rely on the same kindness and collaboration that you've extended to us since we came."

So since we've got nothing, we'd really appreciate it if those of you who know who set the charges would just tell us. And also please consider not murdering us in our sleep. Thanks for that.

Sudyam coughed to hide her laughter and Fayez flashed a grin. At the

front of the room, Reeve nodded and stepped down. The coordinator stood up, looking toward the back of the room. Elvi felt the sudden, powerful need to urinate.

“Doctor Okoye?” the coordinator said. “You wanted to speak?”

Elvi nodded and rose to her feet. It was about ten meters to the front of the room, and Elvi walked forward with her nerves screaming. The heat of the crowd’s bodies seemed suddenly oppressive, the smell of sweat and dust overwhelming. Her tongue felt sticky and thick in her mouth, but she smiled. At an estimate, two hundred people sat before her, their eyes on her. Her heart ticked over so fast she had to wonder whether there was enough air in the room. She remembered someone telling her once to look for a friendly face in the crowd and pretend she was only speaking to them. Four rows in on the left, Lucia Merton was sitting with her hands folded in her lap. Elvi smiled, and the woman smiled back.

“I just wanted to take a minute,” Elvi said, “to talk about how we can limit cross-contamination with the environment? Because we lost the dome? The hard perimeter dome?”

Lucia looked grave. Elvi chanced a look at the rest of the crowd and then wished she hadn’t.

“Part... um. Part of the RCE’s agreement with the UN was that we do a complete environmental study. We’re in just the second biosphere that we’ve ever seen, and there’s so much we don’t know about it that the more we can keep it pristine, the better we’ll be able to understand it. Ideally, we’d have a totally enclosed system here on the surface. Tight as a ship. Airlocks and decontamination rooms and...”

She was babbling. She grinned, hoping that someone would smile back. No one did. She swallowed.

“Every time we breathe, we’re taking in totally unknown microorganisms. And even though we’ve got different proteomes, we’re still big blobs of water and minerals. Sooner or later one of the indigenous species is going to find a way to exploit that. And it goes the other way too. Every time we defecate, we’re introducing billions of bacteria into the environment.”

“So now you’re going to tell us how we can shit?” a man’s voice said.

Elvi felt the sudden heat of a blush in her neck and cheeks. Even Lucia’s expression had gone cold and distant, the woman’s gaze fixed on nothing.

“I only meant that if we were doing this right, we’d have a protected, sterile environment and we wouldn’t be going out into the ruins or cultivating crop plants in the open air because—”

“Because you think we did it wrong,” the man sitting at Lucia’s side said. He was a big man with a dusting of gray at his temples and in the stubble of beard and a permanently angry face. “Only you don’t get to decide that.”

“I understand that we’re working with a complex situation here,” Elvi said, her voice getting rough with desperation. “But we’re all living in this massive Petri dish already, and I have a list of a few little sacrifices that we can all make that, from a scientific perspective—”

The man beside Lucia Merton flushed, and he leaned forward, his fists on his thighs. His eyes fixed on her like a predator’s.

“I’m done sacrificing things to science,” he said, and the buzz in his voice was a promise of violence. Lucia put a restraining hand on the man’s wrist, but others around the room had taken up the man’s disdain. The sounds of their bodies shifting in the seats, the murmur of voices in small conversations of their own filled the air. *Whoever killed Trying is probably in this room*, she thought. And then, immediately after that, *What the hell am I doing here?*

Carol Chiwewe stood up, her expression pained. Embarrassed on Elvi’s behalf.

“Maybe we better come back to that another time, Doctor Okoye,” she said. “It’s late and people are tired, ne?”

“Yes,” Elvi muttered. “Yes, of course.”

Her skin burning with shame, she walked back toward her seat, and then past it, out into the street and alone in the deepening night toward her hut. Her shoes scraped in the gravel and dirt. The air was cool and smelled like coming rain. She wasn’t more than halfway there, moving slowly in the near-black starlight, when a voice stopped her.

“I’m sorry about my dad.”

Elvi turned. The girl was little more than a deeper darkness in the night. A slightly more solid shadow. Elvi found herself thankful that the voice wasn’t a man’s.

“It’s okay,” she said. “I don’t think I did that very well.”

“No, it’s him,” the girl said, stepping closer. “You couldn’t have done

right with him. My brother died, and now Dad's not that kind of man anymore."

"Oh," Elvi said. And then, "I'm sorry."

The girl nodded, shuffled with something, and a pale green light no brighter than a candle bloomed in her palm, casting shadows up over the girl's face. She was pretty the way youth is always pretty, but when she got older, Elvi thought she might be beautiful the way her mother was.

"You're Doctor Merton's daughter," Elvi said.

"Felcia," the girl said.

"Good to meet you, Felcia," Elvi said.

"I can walk you home. If you don't have a light."

"I don't," Elvi said. "I should have brought one."

"Everyone forgets sometimes," the girl said, setting off. Elvi trotted a little to catch up with her. For a dozen meters, they walked in silence. Elvi sensed that the girl was building up to something. A confession or a threat. Something dangerous. Elvi hoped that she was just being paranoid, and was certain that she wasn't.

When the girl spoke at last, her voice was tight with anxiety and longing, and her words were the last thing Elvi would have guessed.

"What's it like going to a real university?"

Chapter Seven: Holden

*T*here should be fanfare, Holden thought.

Passing through a ring into another star system, halfway across the galaxy from Earth, should be a dramatic moment. Trumpets, or loud alarms, tense faces locked on viewscreens. Instead, there was nothing. No physical sign that the *Rocinante* had been yanked fifty thousand light-years across space. Just the eerie black of the hub replaced by the unfamiliar starfield of the new solar system. Somehow, the fact that it was so mundane made it stranger. A wormhole gate should be a massive swirling vortex of light and energy, not just a big ring of something sort of like metal with different stars on the other side.

He resisted the urge to hit the general quarters alarm just to add tension to the moment.

The new sun was a faint dot of yellow-white light, not all that different from Sol when viewed from the Ring sitting just outside Uranus' orbit. It had five rocky inner planets, one massive gas giant, and a number of dwarf planets in orbits even farther out than the Ring. The fourth inner planet, sitting smack dab in the middle of the Goldilocks Zone, was Ilus. New Terra. Bering Survey Four. RCE charter 24771912-F23. Whatever you wanted to call it.

All those names were too simple for what it really was. Mankind's first home around an alien star. Humans kept finding ways to turn the astonishing events of the last few years mundane. A few decades from now, when all the planets had been explored and colonized, the hub and its rings would just be a freeway system. No one would think twice about them.

"Wow," Naomi said, staring at Ilus' star on the display with wide-eyed

awe. Holden felt a rush of affection for her.

"I was just thinking that," he said. "Glad I'm not the only one." He opened a channel up to the cockpit.

"Yo," Alex said.

"How fast can you get us there?"

"Pretty damn fast, if you're willin' to be uncomfortable."

"Put us on a fast burn schedule and get some dirt under my feet," Holden said with a grin.

"High burn'll get us on the ground in 'bout seventy-three days."

"Seventy-three days," Holden said.

"Well, seventy-two point eight."

"Space," Holden said, trading his grin for a sigh, "is too damn big."

Five hours into their burn, the messages started to come in. Holden had Alex bring them down to one-third g for dinner, and played the first recording on the galley screen while he helped Amos make pasta.

An older man, brown-skinned and gray-haired, stared out of the screen at him. He had the thin features and large cranium of a Belter, and just a hint of a Ceres accent.

"Captain Holden," he said once the recording started. "Fred Johnson notified us you were coming, and I wanted to thank you for your help. My name is Kasim Andrada, and I'm captain of the independent freighter *Barbapiccola*. Let me fill you in on the situation as it stands."

"This should be good," Amos grunted, dumping steaming spaghetti noodles into a colander to drain them. Holden handed him the pot of red sauce he'd been stirring, then leaned against the counter to watch the rest of the broadcast.

"The colony finally got a working mining operation running about four months ago. In that time, we've brought up several hundred tons of raw ore from our mine. At the purity levels we're seeing, that should translate to almost a dozen tons of lithium after refining. It's enough to buy equipment, medicine, soil and seeds, everything this colony needs to get a real toehold."

Naomi came into the galley, tapping away furiously at her hand

terminal. “Smells good, I—” She stopped when she saw the video playing and sat down to watch.

“The *Edward Israel*,” Captain Andrada continued, “has stated that they will not allow us to leave orbit until the arbitration is complete. Royal Charter’s position being that they own this lithium until someone says they don’t. One of your first priorities will be to get the *Israel* to lift the blockade and let us take this ore to the Pallas refineries, where we already have buyers lined up and waiting.”

“Oh,” Amos said, dumping the pasta and sauce into a large bowl and putting it on the table. “Is *that* our priority?”

Holden paused the playback. “Did come across as an order, didn’t it?”

“He’s OPA,” Naomi said. “He thinks you’re here as Fred’s mouthpiece.”

“This guy is going to give me indigestion,” Holden said, killing the recording. “I’ll watch the rest of this crap after we eat.”

Five more broadcasts were queued up for viewing by the next day. The captain of the *Edward Israel*, an older Earthman named Marwick with flaming red hair and a British accent, demanded that Holden enforce the RCE charter by disabling the engines of the *Barbapiccola* if it tried to leave the system. Fred sent along encouragement and a reminder that Avasarala was shotgunning threats about the consequences for screwing the mission up. Three different news organizations asked for interviews, including a personal request from Monica Stuart for a live interview when he returned.

Miller watched them over his shoulder until Naomi came into their room and the detective disappeared in a blue shower of sparks.

“I think Monica likes you,” Naomi said with a grin, then flopped down onto the double-sized crash couch they used as a bed. “Alex is taking us back up to high burn in twelve minutes, and I want to die.”

“Monica would flirt with a lizard if she thought it would get her a good interview, tell Alex to give us another half hour so I can send a few responses, and hold on I’ll get my gun.”

Naomi pushed herself up with a groan. “I’ll get some coffee while you find your bullets.”

“Don’t leave,” Holden said, reaching for her arm. “I don’t want to record

these broadcasts with Miller standing behind me.”

“He’s only in your head,” she said, but she sat back down anyway. “He won’t show up on the recording.”

“Do you think that makes it *less* uncomfortable? Really?”

Naomi crawled across the bed and curled up next to him, putting her head on his chest. He tugged on a lock of her hair and she let out a long contented sigh.

“I like long flights when we aren’t doing these bone-crushing mad dashes,” she said. “Nothing to do but read, listen to music, stay in bed all day. You being famous sucks.”

“It’s also the reason we’re sort of rich now.”

“We could sell the ship, go get jobs at Pur’N’Kleen again. Do the Saturn ice run...”

Holden stayed silent and played with her hair. It wasn’t a serious suggestion. They both knew there was no going back to the people they used to be. Him the XO and her the chief engineer on an ice hauler that no one in the universe cared about unless it was late for a delivery. Anonymous people living anonymous lives. Would anyone even need Pur’N’Kleen anymore, with a thousand new worlds full of water and air?

“You going to be okay without me down there?” Naomi said.

The Belter colonists from Ganymede had spent months on the *Barbapiccola* prepping for landing on Ilus. Loading up on bone and muscle growth hormones, working out under a full g until their bodies would be able to handle the slightly heavier-than-Earth gravity of the planet. Naomi didn’t have the time or inclination to radically alter her physiology for this one job. Holden had argued that she would have then been able to come to Earth with him after. She replied that she was never going to Earth, no matter what. They’d left it at that, but it was still a sore spot for him.

“No, I won’t,” he said, deciding not to revisit the argument. “But there it is.”

“Amos will look after you.”

“Great,” Holden said. “I’ll land in the middle of the tensest situation in two solar systems, and instead of the smartest person I know, I’ll bring the guy most likely to get in a bar fight.”

“You might need that,” she said, her fingers tracing some of the scars he’d picked up over the last couple years. She stopped at a dark spot on his

stomach. "You still taking your cancer meds?"

"Every day." *For the rest of my life*, he didn't add.

"Have their doctor look at this after you land."

"Okay."

"They're using you," she said as if they'd been talking about it all along.

"I know."

"They know this is all going to go wrong. There's no solution that doesn't leave someone angry and out in the cold. That's why they're sending you. You're an easy scapegoat. They hired you because you won't hide anything, but that's the same thing that makes you easy to blame for the inevitable failure of these talks."

"If I thought it was inevitable I wouldn't have taken the job," Holden said. "And I know why they hired me for this. It's not because I'm the most qualified. But I'm not quite the idiot they think I am. I think I've learned a few new tricks."

Naomi reached up and pulled a hair out of his temple. Before he could say "ouch" she held it up in front of him. It was the gray of damp ashes.

"Old dog," she said.

The flight to Illus was grueling in more ways than just the long periods at high g. Every time the *Rocinante* dropped to a tolerable rate of acceleration for meals and maintenance, Holden would have dozens of messages waiting to be viewed and responded to. The captain of the *Edward Israel* became increasingly forceful in his demands for Holden to issue threats to the captain of the *Barbapiccola*. The colonists and their Belter compatriots in orbit were increasingly demanding that the *Barbapiccola* be released from lockdown. Both sides accused the other of escalating the conflict, though in Holden's opinion the fact that only the colonists had so far shed blood lessened their claim in that regard.

Their argument that only the sale of their lithium ore could make them a viable colony, and that the blockade of the shipment was effectively starving them out, was, however, a compelling one. RCE continued to insist that since they had the UN charter, the mining rights and the load of lithium in orbit were theirs.

“A thousand new worlds to explore, and we’re still fighting over resources,” Holden said to no one after a particularly long and angry message from the RCE legal counsel on the *Israel*.

Alex, who was lounging at the ops station nearby, answered anyway. “Well, I guess lithium is like real estate. Nobody’s makin’ any more of it.”

“You did hear the part about a thousand new worlds, right?”

“Maybe some of ’em have more lithium, but maybe they don’t. And this one definitely does. People used to think gold was worth fightin’ over, and that shit gets made by every supernova, which means pretty much every planet around a G2 star will have some. Stars burn through lithium as fast as they make it. All the *available* ore got made at the big bang, and we’re not doin’ another one of those. Now *that’s* scarcity, friend.”

Holden sighed and aimed an air vent at his face. The cool breeze from the recyclers made his scalp tingle. The ship wasn’t hot. The sweat had to be coming from stress.

“We’re astonishingly shortsighted.”

“Just you and me?” Alex said, exaggerating his drawl to make a joke of it.

“A vast new frontier has opened up for us. We have the chance to create a new society, with untold riches beyond every gate. But *this* world has treasure, so instead of figuring out the right way to divide up the damned galaxy, we’ll fight over the first crumbs we find.”

Alex nodded, but didn’t reply.

“I feel like I need to be there right now,” Holden continued after a moment. “I’m worried by the time we land everyone will be so locked into their positions that we won’t be able to help.”

“Huh,” Alex said, then laughed. “You think we’re going there to help?”

“I think I am. I’ll be down in engineering if anyone needs me.”

“One hour to burn,” Alex replied to his back.

Holden kicked the deck hatch release and it slid open with a hiss. He climbed down the ladder past the crew decks to the machine shop, where Amos was taking apart something complex-looking on one of the benches. Holden nodded to him and kicked open the final hatch into the reactor room. Amos shot him a questioning look, but Holden just shook his head and the mechanic turned back to his work with a shrug.

When the hatch slid closed above him, the reactor room flashed with

blue light. Holden slid down the ladder to the deck, then leaned back against the wall.

“Hey,” Miller said, coming around the reactor that dominated the center of the room as though he’d been standing on the other side of it waiting for Holden to arrive.

“We need to talk,” Holden replied.

“That’s my line.” The detective gave him a sad, basset-hound smile.

“We’re doing what you wanted. We’ve come through a ring into one of the other systems. You’ll get to, I assume, ride me to the planet and take your look around.”

Miller nodded, but didn’t speak. *How much of what I’m about to say does he already know? How predictive is the brain model they’ve made of me?* Holden decided wondering that was the path to madness.

“I need to know two things,” Holden said, “or this trip ends right now.”

“Okay,” Miller said with a palms-up, Belter version of a shrug.

“First, how are you following me around? You first showed up on this ship after Ganymede, and you’ve been everywhere I go ever since. Am I infected? Is that how you stay with me? I’ve gone through two gates without ditching you, so either you’re inside my head or you’re a galaxy-wide phenomenon. Which is it?”

“Yeah,” Miller said, then took off his hat and rubbed his short hair. “Wrong on both counts. First answer is, I live here. During the Ganymede incident, which is a stupid name for it, by the way, the protomolecule put a local node inside this ship.”

“Wait. There’s protomolecule stuff in the *Roci*?” Holden said, fighting down the surge of panic. If Miller wanted to hurt him and had the means to do so, it would already have happened.

“Yeah,” Miller said with a shrug, like it wasn’t a big deal. “You had a visitor, remember?”

“You mean I had a half-human monster,” Holden said, “that almost killed Amos and me. And that we vaporized in our drive trail.”

“Yeah, that’d be him. To be fair, he wasn’t exactly running a coherent program, that one. But he had enough of the old instructions left that he placed some material on the ship. Not much, and not what you’d call live culture. Just enough to keep a connection between the Ring Station’s processing power and your ship.”

“You infected the *Roci*?” Holden said, fear and rage briefly warring in his gut.

“Don’t know I’d use that verb, but all right. If you want. It’s what lets me follow you around,” Miller said, then frowned. “What was the other thing?”

“I don’t know if I’m done with *this* thing,” Holden said.

“You’re safe. We need you.”

“And when you don’t?”

“Then no one’s safe,” Miller said, his eerie blue eyes flashing. “So stop obsessing. Second thing?”

Holden sat down on the deck. He hadn’t wanted to ask how Miller was in his head, because he was terrified the answer would be that he was infected. The fact that he wasn’t, but his ship was, was both a relief and a new source of fear.

“What will we find down on Ilus? What are you looking for?”

“Same thing as always. Who done it,” Miller said. “After all, something killed off the civilization that built all this.”

“And how will we know when we’ve found it?”

“Oh,” Miller said, his grin vanishing. He leaned toward Holden, the smell of acetate and copper filling the air or else only his senses. “We’ll know.”

Chapter Eight: Elvi

The sandstorms tended to start in the late afternoon and last until a little after sundown. They began as a softening of the western horizon. Then the little plant analogs in the plain behind her hut would fold their photosynthetic surfaces into tight puckers like tiny green mouths that had tasted lemon, and twenty minutes later the town and the ruins and the sky would all disappear in a wave of dry sand.

Elvi sat at her desk, Felcia at the foot of the bed, and Fayeze with his back against the headboard.

Felcia had become a regular visitor, more often than not to talk with Elvi or Fayeze or Sudyam. Elvi liked having her around. It made the division between the township and the RCE teams seem... not less real, but less terrible. Permeable.

Today, though, felt different. Felcia seemed more tightly wound than usual. Maybe it was the fact that the UN mediator's ship was getting close. Maybe it was the weather.

"So, our solar system only has one tree of life," Elvi said, moving her hands in the air as if to conjure it up. "It started once, and everything we've ever found shares that ancestry. But we don't know why."

"Why we all share?" Felcia asked.

"Why it didn't happen twice," Elvi said. "Only one kind of Schrödinger crystal. One codon map. Why? If all the materials were there for amino acids to form and connect and interact, why wasn't there one schema that started in one tide pool, and then another someplace else, and another and another? Why did life arise just the one time?"

"So what's the answer?" Felcia asked.

Elvi's let her hands wilt a little. A particularly strong gust drove a wave of hard grit against the side of the hut. "Which answer?"

"Why it only happened once?"

"Oh. I don't know. It's a mystery."

"Same reason there's only one tool-using hominid left. The ones that still exist killed all the competition," Fayez said.

"That's speculation," Elvi said. "Nothing in the fossil record indicates that there was more than the one beginning of life on Earth. We don't get to just make things up because they sound good."

"Elvi is very comfortable with mysteries," Fayez said to Felcia with a wink. "It's why she has a hard time relating with those of us who feel anxious with our ignorance."

"Well, you can't know everything," Elvi said, making it a joke to hide a tinge of discomfort.

"God knows I can't. Especially not on this planet," Fayez said. "There was no point sending a geologist here."

"I'm sure you're doing fine," Elvi said.

"Me? Yes, I'm wonderful. It's the planet's fault. It's got no geology. It's all manufactured."

"How do you mean?" Felcia asked.

Fayez spread his hands as if he were presenting her with the whole world. "Geology is about studying natural patterns. Nothing here's natural. The whole planet was machined. The lithium ore you people are mining? No natural processes exist that would make it as pure as what you're pulling out of the ground. It can't happen. So apparently, whatever built the gates also had something around here somewhere that concentrated lithium in this one spot."

"That's amazing, though," Elvi said.

"If you're into industrial remediation. Which I'm not. And the southern plains? You know how much they vary? They don't. The underlying plate is *literally* as flat as a pane of glass. Somewhere about fifty clicks south of here, there's some kind of tectonic Zamboni machine about which I am qualified to say absolutely nothing. Those tunnel complexes? Yeah, they're some kind of old planetary *transport* system. And yet here I am—"

"I need a letter of recommendation," Felcia blurted, then looked down at her hands, blushing. Elvi and Fayez exchanged a glance. The wind howled

and muttered.

“For what?” Elvi asked gently.

“I’m going to apply for university,” the girl said. She spoke quickly, like the words were all under pressure, and then more slowly until at last she trailed away. “Mother thinks I’ll probably get in. I’ve been talking with the Hadrian Institute on Luna, and Mother arranged that I can get back to Pallas when the *Barbapiccola* takes the ore, and then take passage on my own from there, only the application needs a letter of recommendation, and I can’t ask anyone in the town because we haven’t told Daddy, and...”

“Oh,” Elvi said. “Well. I don’t know. I mean, I’ve never seen your academic work—”

“Seriously?” Faye said with a snort. “Elvi, it’s a letter of recommendation. You’re not under oath for it. Cut the kid a break.”

“Well, I just thought it would be better if I could actually say something I know about.”

“When I went to lower university, I wrote my own letters of recommendation. Two of them came from people I made up. No one checks.”

Elvi’s jaw dropped a centimeter. “Really?”

“You are an amazing woman, Elvi, but I don’t know how you survive in the wild.” Faye turned to Felcia. “If she won’t, I will. You’ll have it by morning, okay?”

“I don’t know how I can repay you,” Felcia said, but she already looked calmer.

Faye waved the comment away. “Your undying gratitude is thanks enough. What’s your field of study going to be?”

For the next hour, Felcia talked about her mother’s medical career, and her dead brother’s immune disorder, and intracellular signaling regulation. Elvi began to realize that she’d unconsciously thought of the girl as younger than she really was. She had the long, slightly gangly build and comparatively large head of a Belter, and somewhere in Elvi’s mind, she’d mistaken it for youth. Felcia would have fit right in at the commons of lower university. The light shifted from beige to deep brown to a burnt umber, and then darkness. The wind calmed. When Elvi opened her door, two centimeters of fine dust covered the walkway and the stars glimmered in the sky. The air smelled like fresh-turned earth. Some sort of

actinomycete analog, Elvi thought. Maybe one that was actually carried by the wind. Or maybe something else. Something stranger.

Felcia headed back for the town, Faye for his own hut. As far as she could tell, Faye was one of maybe two or three other people on the science team who was still sleeping alone. Sudyam and Tolerson were the latest pairing. Laberge and Maravalis had just broken off the relationship they'd started on the journey out, and each of them was already involved with someone else.

Sex wasn't a strange thing among the scientific teams. That it was unprofessional behavior was set in balance against the fact that—especially on a years-long field expedition like this—the pool of potential mates was both very restricted and generally fairly high-value. People were people. If she felt any jealousy at all, it wasn't for any of the particular relationships, but for intimacy itself. It would be nice to have someone to walk with in the darkness after the storm. Someone to wake up with in the morning. She wondered what the sexual politics were among the families of First Landing. If RCE had thought to send a social science team, it might have made a good paper.

Ahead of her and to the right, the alien ruins stood against the horizon, hardly more than a deeper darkness. Only a light was moving in them. It was small and faint. Less than a star, and only visible at all because it was moving. Someone was in the ruins again. Contaminating the site. She knew intellectually that she was letting herself be angry about it because it was better than feeling lonesome or guilty, but that didn't keep the rage from feeling real. She turned back to her hut, her lips pressed together. She scooped up a flashlight, checked the battery charge, and stalked out toward the ruins, the thin blue circle of light bobbing ahead of her and illuminating her way. The fine dust shifted under her feet like snow, and her thighs ached from the speed of her hike.

As she neared the ruins, she thought she saw a dim light heading the other way. Back toward the town. But when she called after it, no one answered. She stood in the darkness for almost a minute feeling first unsure of herself, then embarrassed, then angry at feeling embarrassed.

A path led into the ruins that even the recent dustfall couldn't conceal. Tracks as wide as a wagon where wheels had gone over the land often enough to leave ruts. Elvi shook her head and followed the path up, twisting

around a high shoulder of land and into the huge alien structures.

Inside, the beam of her flashlight caught the walls and surfaces, sending off glittering reflections that seemed to shift whether she did or not. Where there was shelter from the wind, there were footprints. Lots of them. It wasn't just someone from town exploring on their own. They were treating the ruins like some sort of clubhouse. Any samples the science team took from the soil here would already be compromised. The microorganisms, a mixture of known and unknown and whatever emerged when the two encountered each other in a totally uncontrolled environment. That the same was true of the whole township seemed insignificant. These were alien structures. They'd been built by a vast, vanished civilization about which humanity still knew almost nothing. It wasn't some kind of *treehouse*.

"Hello?" she shouted. "Is anyone in here?"

Nothing answered her. Not even the wind. Shaking her head, she stalked deeper into the shadows. If anyone was here, she'd give them the talk she'd meant to give before. She would make them understand the issues, even if it took hectoring them all night.

The walls around her rose at strange and unsettling angles from the ground, organic and also not, like a machine that was built to pass for the product of nature. Arches rose, looking out over the bare, dark land. The deeper Elvi went, the more there seemed to be, until she had the illusion that the ruins were larger inside than out.

She was about to give up and turn back home when she saw something square. Simply being rectilinear made it stand out. The boxes were plastic and ceramic, functional gray where they weren't the bright red and yellow of warning labels. DANGER HIGH EXPLOSIVE. DO NOT STORE NEAR HEAT OR CLASS THREE RADIATION SOURCES.

"Oh no," Elvi said to herself. "Oh *hell* no."

"Doctor Okoye," Reeve said. "I'm hearing you tell me that you found explosives hidden outside of the town."

"Yes," Elvi said. "Of course that's what you're hearing me say."

"And that there is evidence of several people having been to this

clandestine site.”

They were sitting in Reeve’s office now. The light from his lamp shone warm and soft, and his rough pants and untucked shirt suggested she’d roused him out of bed. It felt like the middle of the night, though the extended rotational period meant the darkness would be stretching on for almost another ten hours.

“Yes,” she said.

“All right,” Reeve said. “It’s all right. This is a good thing. I need you to tell me how to find this place.”

“Yes. Of course. I’ll take you.”

“No, I need you to stay right here. Not back to your hut. Not out to the ruins. I need you right here where it’s safe. You understand?”

“There was someone out there. I saw the light, and that’s why I went. What if they’d still been there?”

“We don’t have to worry about that, because it didn’t happen,” Reeve said in a carefully reassuring tone of voice that meant *You’d be dead*. Elvi dropped her head into her hands. “Can you give me directions?”

She did her best, her voice trembling. Reeve constructed a map on his hand terminal, and she was fairly sure it was accurate. Her mind seemed to be shifting on her a little, though.

“All right,” Reeve said. “I’m going to have you stay here for a little while.”

“But my work is all back at the hut.”

The security man put a reassuring hand on her shoulder, but his gaze was already focused inward, planning some next step that didn’t include her.

“We’re going to see you’re safe first,” he said. “Everything else will come after that.”

For the next hour, she sat in the little room or paced. The voices of Reeve and his security team filtered in through the wall, the tones serious and businesslike. And then there were fewer of them.

A young woman came to get her. Elvi had seen her before, but didn’t know her name. It seemed wrong that they could have spent almost two years traveling out here together, and Elvi still didn’t know her. It should mean something about populations and how they mixed. And how they didn’t.

“Do you need anything, Doctor Okoye?”

“I don’t know where to sleep,” Elvi said, and her words seemed thin. Fragile.

“I’ve got a bunk ready,” the girl said. “Please come with me.”

The rooms were empty. The others gone out into the alien darkness to face a terribly human threat. The girl leading her to the bunk had a sidearm strapped to her belt. Elvi glanced out the front window as they passed. The street was the same one she’d walked down the day before, and it was also wholly changed. A sense of threat hung over everything like the promise of a storm coming. Like the haze on the horizon. She saw Felcia’s brother walking down the street, not looking at her or anything else. Her fear was cold and deep.

Chapter Nine: Basia

Basia had volunteered for the night shift at the mine. Fewer people to hide from. Less open sky to make him jittery. The work, as backbreaking as it was, was a relief. The fabricator they'd brought down from the *Barbapiccola* was building tracks and carts as fast as they could load raw material into it. His team was trying to keep up with its output by assembling the rail system that would move ore from the pit to the sifters to the silos. There, it would wait for the *Barbapiccola*'s shuttle to take it up into orbit. Everything they'd mined so far had been moved with wheelbarrows by hand. A motorized cart system would increase production by an order of magnitude.

So Basia and his team worked the metal rails, pulling them out of the fabricator gleaming and new in the harsh white lights. They loaded them on handcarts and dragged them into the mining pit. Then unloaded them by hand and welded them into the growing railway system. It was the kind of physical labor people had mostly stopped doing in their mechanized age. And the process of welding inside an atmosphere was totally unlike welding in vacuum, so he had a new skill set to develop. The combination of mental challenge and physical toil left him exhausted. His world narrowed to the next task, the ache in his hands, and the distant promise of sleep. There was no time to dwell on other things.

Like being a murderer. Like the corporate security forces sniffing around for him and Coop and the others. Like the guilt he felt every time Lucia lied to them and said she didn't know anything that would help.

Later, when he sat in the crew hut with his muscles twitching and cramping with fatigue, trying to sleep with the daylight streaming in

through the windows, then he could revisit the death of the shuttle over and over again. Think about what he could have done to disable the explosives faster than he did. How he could have tackled Coop, taken the radio away from him. If his mood was especially bad, he would think about how if he'd just listened to his wife, none of it would have happened in the first place. On those days he felt such shame that he hated her a little for it. Then hated himself for blaming her. The pillow he pressed to his eyes kept the sunlight out, but not the images of the shuttle exploding over and over again, screaming like a dying beast as it went down.

But during the night, while he worked, he had some measure of peace.

So when Coop appeared at the work site, sauntering into the pit like he didn't have a care in the world, Basia almost hit him in the face.

"Hey, mate," Coop said. Basia dropped his hammer, shoulders slumping.

"Hey," he said.

"So we got a thing," Coop continued, throwing one companionable arm around Basia's shoulders. "Need mi primero on it."

That couldn't be good. "What thing?"

Coop guided him away from the work site, smiling and nodding at the few other night-shift crew they passed. Just two chums out for a walk and a conversation. When they were out of earshot of everyone, he said, "Seen that RCE girl going up to the ruins. Sent Jacek to check on it."

"Sent *Jacek*," Basia echoed. Coop nodded.

"Good kid. Reliable."

Basia stopped, pulling his arm away. "Don't—" *Involve my son in this*. Before he could get the words out, Coop waved it off and kept talking.

"Está important." Coop stepped close, voice lowering. "She went up to the ruins, then went straight to the RCE goons. Jacek says they're planning to wait for us up there. Catch the resistance red-handed."

"Then we don't go back," Basia said. It seemed so simple. No reason to panic.

"You crazy, primo? Toda alles been up there. Trace evidence up the ass. They wait long enough, they get bored and bring a real crime scene team down, we all done. All of us, y veh unless you stopped shedding skin when you were there."

"Then what?"

"We go up first. A flare on that blasting powder, boom. No more

evidence.”

“When?”

Coop laughed. “What you think? Next week some time? *Now*, coyo. Got to go now. Mediator’s landing in hours-not-days. Don’t want this to be what he sees when he steps off the ship, do you? You a team lead, you can take one of the carts. We got to get that shit and get gone.” Coop snapped his fingers impatiently. “Jetzt.”

Coop spoke about insanity like blowing up their stash of mining explosives with such an air of self-assurance and certainty, Basia found it hard to argue. Sure, blowing up the alien ruins was crazy. But Coop was right. If they found the explosives and traced them back to Basia, they’d know. He didn’t want to, but he had to. So he would.

“Okay,” he said and walked toward the cart charging station. Only one was left, and because the universe was a cruel and mocking place, it was the same one he’d been driving the night of the bombing. It still had the dents and scorch marks it had picked up that night. The scorch marks everyone in the colony was careful not to ask about.

Coop waited impatiently for him to unlock it and back it out of the stall, then hopped in and started tapping out a fast drumbeat on the plastic dashboard. “Let’s go let’s go let’s go.”

Basia went.

Halfway to the alien ruins, they came across four more of Coop’s inner circle. Pete and Scotty and Cate and Ibrahim. No Zadie. Her little boy had come down with a nasty eye infection, and she wasn’t around much lately. Cate had a duffel bag she threw into the back of the cart with a metallic thump, then the four of them climbed in after it.

“That the stuff?” Coop asked, and Cate nodded and slapped the side of the cart to let Basia know he could drive. Basia didn’t ask what the stuff was. Too late to start questioning.

The ruins looked as dark and deserted as they ever did, but Coop made Basia drive the long way round to come at the site from the side opposite the town. “Just to be safe,” he said.

When Cate pulled open the duffel, Basia wasn’t surprised to see it filled with guns. The *Barbapiccola* hadn’t been a warship. They hadn’t left Ganymede with a great store of weapons, but what there was had come down to the surface when First Landing was begun. This looked like most

of them. Cate pulled out a shotgun and started loading fat plastic shells into it. She was a tall, rawboned woman with a wide jaw and a permanent frown line between her eyes. She looked natural holding a gun. Like a soldier. When Basia picked one up, a short-barreled automatic pistol of some kind, he felt like a child playing dress-up.

“You’ll need this, killer,” Ibrahim said and tossed him a narrow metallic object. It took Basia several seconds to realize it was the magazine for his pistol. It only took two tries to slide it in the correct way. Blow the explosives. Clear the site. Destroy the evidence. That had never really been the plan, and somewhere in his gut, he’d known.

While the rest of the group finished readying their weapons, Basia stood a few meters from the cart, staring up at the night sky. One of the points of light was the drive tail of the *Rocinante*, the ship Jim Holden was flying in on. The mediator. The one who was supposed to keep the colonists and RCE people from killing each other. He wondered how far out Holden was. He wondered if the man knew he was already too late. Too late for the second time. Holden had been too late on Ganymede too.

Basia’s son Katoa hadn’t been the only one who was sick. Whose immune system had faltered and failed under the thousand different stressors of life outside a gravity well. There had been a group of them who’d come to Doctor Strickland. The man who was supposed to know the answers. Katoa, Tobias, Annamarie, Mei. Mei, who had lived. Who James Holden had rescued from the labs on Io.

Holden had been there when they found Katoa too. Basia had never met the man. Had only ever seen him on news broadcasts. But Mei’s father had been a friend. He’d sent a message telling Basia what had happened, and that he’d been with Holden when they found the boy’s body.

Why one and not the other? Praxidike’s Mei, but not his Katoa. Why did some people die and others live? Where was the justice in it? The stars he looked up at didn’t have any answers for him.

Holden had been too late to stop what was happening on Ilus right now before anyone had ever set foot on it. Before the rings opened. Before Venus bloomed. If Katoa were still alive, Basia wouldn’t have come here, and if he had, he wouldn’t have stayed.

It was a strange thought. Surreal. Basia tried to picture the man he’d be in that other timeline, and couldn’t. He looked down at the ugly black gun

in his hand. *I wouldn't be doing this.*

"Game's on," someone said. Basia turned around. It was Coop. "Get back in it, coyo."

"Dui," Basia said, and took a deep breath. The night air was cold and crisp and tasted vaguely of dirt from that afternoon's dust storm. "Dui."

"Follow on," Coop said, then headed off to the ruins at a slow trot. Cate and Ibrahim and Pete and Scotty followed, clutching their guns in what they probably thought was a military style. Basia carried his pistol by the barrel, worried about getting his fingers anywhere near the trigger.

They entered the massive alien structure through one of the many openings in its side. Windows? Doors? No aliens left to say. Inside, the light coming off their flashlights and work lamps reflected off the smooth, strangely angled walls. The material looked like stone, was smooth as glass, and turned from black to a rosy pink where the light hit it. Basia trailed his fingers along it.

Coop waved for them to stop, and then ducked down and crab-walked over to a windowlike opening in one wall. He peeked over and dropped back down, motioning for the group to join him. Basia hunkered down with the rest.

"See?" Coop whispered, pointing at the next room beyond the window. "Knew they'd set up there."

Cate popped up for a second to look, then crouched down again with a nod. "I see five. Reeve, the boss, and four of his goons. Sidearms and stun guns. They're all looking the wrong way."

"Too easy, boss," Scotty whispered with a grin, and clicked off the safety on his rifle. Cate slid open the breech on her shotgun just far enough to make sure there was a shell loaded. Coop held up his big automatic pistol in one hand and yanked back the slide. Then on his other hand he raised three fingers and started silently counting down.

Basia looked at each of them in turn. They looked flushed and excited. All except Pete, who stared back at Basia, his skin looking a sickly green in the pale light, and his head shaking back and forth in a silent negation. Basia could practically hear the man thinking, *I don't want to do this.*

Something shifted in Basia's mind, and the world seemed to snap into focus with an almost physical sensation. He'd been following Coop in a daze since the moment the man showed up at the work site. And now they

were about to shoot a bunch of RCE security people.

“Wait,” he said. Coop answered by standing up, pointing his pistol into the next room, and firing.

Basia’s mind stuttered. Time skipped.

Coop, yelling obscenities and firing his pistol over and over into the next room. Basia is lying on his back on the floor looking up as shell casings tumble out of Coop’s gun and bounce across the ground next to him. They appear to be moving so slow that Basia can read the manufacturer’s stamp. TruFire 7.5mm they say.

Skip.

He is standing next to Cate. He has no memory of getting up. She is firing her shotgun, and the sound of it going off in the tight space is deafening. He wonders if he will suffer permanent hearing loss. In the next room, three men and two women in RCE security uniforms are scrambling to take cover, or draw weapons, or return fire. They have looks of panic on their faces. They shout to each other as they move. He doesn’t recognize any of the words. One of them fires a pistol, and a bullet slams into the wall near Cate. A piece of the bullet or a piece of the wall punches a small hole in her cheek. She continues to fire as if the injury is beneath notice.

Skip.

An RCE security woman clutches at her chest as blood fountains out of it. Her face is pale and terrified. He is just a meter away from her, standing next to Scotty. Scotty shoots her again, this time in the neck. She falls backward in slow motion, hands reaching up to the wound but going limp and lifeless halfway there, and she just looks like she’s shrugging.

Skip.

He stands by himself in a corridor. He doesn’t know where it is or how he got there. He hears gunfire behind him, and screams. An RCE security man is a few meters ahead of him, holding a stun gun. The man has dark skin and bright green eyes, wide with fear. Basia suddenly remembers that the man’s name is Zeb, though he can’t remember why he knows that. Zeb throws the stun gun at him and reaches for the pistol he still has in a holster on his hip. The stun gun bounces off Basia’s head, opening up a three-centimeter gash that begins bleeding heavily, but he doesn’t feel it. He sees Zeb pulling his pistol, and without thinking about it he points his own gun at him. He’s surprised to see that he’s holding it correctly, by the handle,

with his finger on the trigger. He doesn't remember doing that. He pulls the trigger. Nothing happens. He's about to pull it a second time when there is a loud bang from behind him, and Zeb begins to fall, blood gushing from his forehead. He waits for the blackout.

There was no skipping. No respite. No escape.

"Good job," Coop said behind him. "That one almost got away."

Basia turned slowly, still in a dream. A fugue. A dissociative state. The impulse to lift his hand one more time, to let the violence carry him just one step farther and shoot Coop almost lifted his arm. Almost, but not quite. Zeb bled out on the floor. The sounds of gunfire stopped.

Behind him, the rest of his group whooped and hollered in happy and excited voices. Basia looked at his gun, remembering how they work in action videos. You put the magazine with the bullets in it in the gun, and then you have to put a bullet in the chamber. He remembered Cate pulling back the breech on her shotgun. Coop pulling back the slide on his automatic. Basia's gun wouldn't have fired no matter how many times he pulled the trigger.

Zeb stopped bleeding. *That was almost me*, Basia thought, but the thought had no emotional content yet. No weight. It was like a puff of acrid smoke passing through his mind, and then gone again.

"Help us drag these bodies out back, primo," Coop said, patting him on the back. "Zadie's washing the place down with corrosives and digestive enzymes, kill the evidence, but they ain't gonna eat the big chunks, eh?"

Basia helped. It took them several hours to bury the corpses of the five women and men in the hard-packed dirt behind the alien ruins. Coop assured them that the next dust storm would remove all signs that anyone had dug there. The RCE people would just disappear without a trace.

Scotty and Pete dragged the rest of their explosives out of the ruins and loaded them on the cart. Then they walked back to town with Cate and Ibrahim. Cate carried her duffel of guns over one shoulder. Basia's pistol was in it again, never having been fired.

"We had to do this," Coop said once they'd left. Basia didn't know if he was telling Basia that or himself. Basia nodded anyway.

"You set this up. You knew you were going to kill them, and you made me part of it."

Coop gave him a Belter shrug and a cruel smile. "You knew that coming

out, coyo. You maybe pretended not to, but you knew.”

“Never again,” Basia said. “And if anyone in my family is hurt because of this, I will kill you myself.”

He drove back to the mine, then walked to his house. The sun was just coming up when he finally stumbled into his tiny bathroom. The man in the mirror didn’t look like a killer, but his hands were covered with blood. He started trying to wash them off.

Chapter Ten: Havelock

About five hours before—when Havelock had been halfway through his ten-hour shift—a man dressed in an orange-and-purple suit so ugly it approached violence sat down on a couch in a video studio on Mars. Havelock floated against his restraints, considering him. Strapping in was second nature now, even though it felt a little silly. The orbital space around New Terra was essentially empty, and the chance of a sudden acceleration was almost nil. It was just a habit. On the little monitor set into the cabin wall, the young man shook the feed host's hand and smiled at the camera.

It's been a while since you came by, Mister Curvelo," the host said. "Thank you so much for coming back."

"Good to be here, Monica," the man said, nodding like he'd been caught at something. "Good to be back."

"So I got a chance to play the new game, and I have to say it seems like a *real* departure from your previous work."

"Yeah," the man said shortly. His jaw was tight.

"There's been a certain amount of controversy," the host said. Her smile was a little sharper. "You want to talk about that?"

It was physically impossible for Havelock to sink back into his couch, but psychologically it was a snap.

"Monica, look," the man in the ugly suit said, "what we're exploring here are the *consequences* of violence. Everybody's looking at that first section, and they don't think about how everything comes after."

Havelock's hand terminal chimed. He muted the newsfeed and took the connection.

"Havelock," Murtry said, "I have a call I need you to take."

His voice was so calm and controlled, Havelock felt his breath go shallow. It was the sound of trouble, and his mind clutched at the first fear that came. The *Rocinante* and Jim Holden, the UN mediator, was about ten hours from the end of its deceleration burn. Almost here. If something had gone wrong with it...

"Something happened downstairs," Murtry said. "I've got Cassie on the horn, and I need you to keep her from melting down while I talk to the captain."

"Is it bad?"

"Yeah. Take the call. Be the calm one. You can do that?"

"Sure, boss," Havelock said. "Cool as November, smooth as China silk."

"Good man."

The picture froze for a fraction of a second, and then Cassie was looking out at him. For a year and a half, they'd been on the ship together, part of the same team, familiar if not intimate. He'd been aware vaguely when she'd struck up a romance with Aragão and then when they'd broken it off. He thought of her as a friend because he didn't think about her much at all.

In the image, her skin had an ashy color, and her eyes were lined with red.

"Cassie," Havelock said, his voice falling into the comforting register he'd trained for in the hostage negotiation workshop he'd taken after the Ceres riots. "Hear things are a little rough down there."

Cassie's laugh shifted the camera, shaking her on the screen like an earthquake. She looked away, and then back.

"They're gone," she said. In the pause afterward, her gaze shifted like she was looking for something. More words to say, maybe. "They're gone."

"Okay," he said. A thousand different questions pressed forward, wanting to be asked. *What happened? Who's missing? What happened?* But Murtry hadn't asked him to find out, and Cassie didn't need an interrogator. "Murtry's talking to the captain."

"I know," Cassie said. "We had a lead. We found a hideout. Reeve took them out. I stayed back with the witness."

"Is the witness there?"

"She's sleeping now," Cassie said. "I'm a security systems consultant, Havelock. I'm supposed to be figuring out optimal shift schedules and building the surveillance network. I don't shoot people. That's not my

fucking pay grade.”

Havelock smiled, and Cassie smiled with him, a tear leaking out the side of her eye. For a moment they were both laughing, the horror and the fear transforming into something like exasperation. Something a little bit safer.

“I’m scared as hell,” Cassie said. “If they come for me too, I won’t be able to stop them. I’ve got the office locked down, but they could cut through the walls. They could blow the place up. I don’t know why we thought it was a good idea to be down here at all. After they blew the heavy shuttle, we should have hauled our butts back up the well and stayed there. We should have dropped rocks on them from fucking orbit.”

“The thing now is keeping you and the witness safe.”

“And how are you going to do that?” Cassie asked. Her voice was a challenge, but one that wanted to be answered. *You can’t* and *Tell me that you can* all at the same time.

“We’re working on that,” Havelock said.

“I don’t even have food in here,” Cassie said. “It’s all at the commissary. I’d kill for a sandwich. I really would. I’d kill for it.”

Havelock tried to remember what they’d said in the workshop about talking with people who’d been traumatized. There was a list. Four things. The mnemonic was BEST. He couldn’t remember what any of the letters stood for.

“So,” he said. “I bet you’re pretty freaked out right now.”

“I’m not holding it together.”

“Yeah, it feels like that, but actually, you’re doing good just by not making it worse. That’s how people usually get it wrong when things go to hell. Overreact, escalate. All goes pear-shaped. You’re holed up and talking to us. Means you’ve got good instincts for this.”

“You’re making that shit up,” Cassie said. “I’m just this side of going catatonic.”

“Stay on this side, and that makes it a win. Seriously, though, you’re doing the right thing. Stay cool, and we’ll get on top of this. I know it feels like it’s all going to hell, but you’re going to be all right.”

“If I’m not—”

“You will be.”

“But if I’m not. *If*, right?”

“Okay,” Havelock said. “If.”

“Do me a favor. There’s a guy back on Europa. Hihiri Tipene. He’s a food engineer.”

“Okay.”

“Tell him I said I was sorry.”

She thinks she’s going to die, Havelock thought, *and she may be right*. The bright, coppery taste of fear flooded his mouth. The locals were killing RCE security, and she was the last one standing. He didn’t know anything about the state of play down there. For all he knew, there might be three tons of industrial explosive about to turn Cassie into a memory. Any moment, she could die, and he could watch her die and not be able to do anything about it.

“You’re going to tell him yourself,” he said gently. “And after this, it won’t even be scary.”

“I don’t know. You’ve never met Hihiri. Promise me?”

“Sure,” Havelock said. “I’ve got your back on this one.”

Cassie nodded. Another tear streaked down her cheek. He didn’t feel like he was doing a great job of keeping her from meltdown.

A tiny inset window appeared on the feed. Murtry’s security override.

“Hey there, Cass,” Murtry said. “I’ve talked to Captain Marwick, and we’re dropping a team to you. It’s going to take us a couple hours, though. Your job is to keep that civilian safe.”

Cassie’s voice trembled when she spoke, but it didn’t break. “There are forty of our people on the planet and two hundred of *them*. I’m one person. I can’t protect everyone.”

“You don’t have to,” Murtry said. “I’ve sent the lockdown notice. I’m coordinating the science teams. That’s on me. Your job is Doctor Okoye. You just keep her breathing until we’re down there, okay?”

“Yessir.”

“All right,” Murtry said. “Two hours. You can do this, Cass.”

“Yessir.”

“Havelock, we’re doing a briefing in the security office right now. If you could pop by?”

“On my way,” Havelock said. He undid his straps, pulled himself out of his couch, and launched for the hallway. The *Edward Israel* had corridors that were built as elongated octagons, like something his grandfather would have traveled in. The straps and toeholds along the walls had no

directionality. He moved quickly down the hall, his brain flipping from telling him that he was climbing up a massive steel-and-ceramic well to falling headlong down it to—oddly—crawling upside down, as if he were on the ceiling of a drainage pipe. Belters, he'd been told, had a natural sense of themselves divorced from set ideas of up and down, but he'd only heard that from Belters, and always in the context of how they were better than him. Maybe it was true, maybe it was exaggeration. Either way, by the time he pulled himself into the security office, he felt a little woozy, and missed the false gravity of thrust.

Ten people clung to the walls, all oriented the same way. Men and women with radically different facial structures and skin tones, and all with the same expression. It was almost eerie. Murtry had broken out the riot gear, and the blue-gray body armor with the high neck-protecting collars made them all seem like huge, human-shaped insects. Even Murtry was wearing it, so apparently he was going on the drop too.

“—I have left,” Murtry was saying from his place at the front of the room. “And you're *all* I have left. The cavalry's not going to come in and save our butts. We are the cavalry, and that means I have already lost everyone I'm going to lose. We are the security team for this whole planet, right here in this room. And we can do it, but not if we're making sacrifices. While we're down there, if you feel threatened, you do whatever it takes to protect yourself and your team.”

“Sir?”

“Okmi?”

“Does that mean we have authorization for lethal response?”

“That means you have authorization for *preemptive* lethal response,” Murtry said, then waited a moment for the words to sink in. Havelock sighed. It was ugly, but there wasn't a choice. If the heavy shuttle had been just a crime, they could have dealt with it like police. But the locals hadn't stopped there, and now more RCE people were missing or dead. So now it was more like a war.

Well. At least they'd tried the peaceful way first. Not that the Belters would give them any credit for it.

“We're dropping in twenty minutes,” Murtry said. “It's a long, fast drop, and some of it'll be choppy. I'm bringing us down just east of the Belter camp. Smith and Wei are squad leads. Our first priority is reaching and

reinforcing the office down there.”

“What about the *Barbapiccola*?” someone asked.

“Screw the *Barbapiccola*! What about the *Rocinante*?”

Murtry lifted his hand, palm out.

“Don’t any of you spend your time worrying about what’s happening up in orbit or back at home. That’s on me, and I’ll take care of it. Me and Havelock.” Murtry flashed a quick smile at him, and Havelock nodded, almost a little bow. “You have your orders, and you have my trust. Let’s get downstairs and get this clusterfuck under control.”

The security force broke, bodies moving through the air in a fast, efficient stream toward the hangar and the light shuttles. Havelock felt a thin stab of regret, watching the others head down without him. He remembered something from his childhood, a flash of memory here and gone, about a lame child and the Pied Piper.

Murtry floated through the air toward him, moving against the flow.

“Havelock, good to see you. I’m going to need a minute.”

“Yes, sir.”

Murtry nodded toward his private office. It was a tiny room, smaller even than a sleeping cabin, with a crash couch on old-style gimbals that arced up and over it. Murtry closed the door behind them.

“So I’m putting you in charge of the ship.”

“Thank you, sir.”

“I wouldn’t go that far. I’m leaving you in a crap position,” Murtry said. “We’ve got a full crew on the *Israel* that are mostly eggheads with their petticoats in a bunch because we’re not letting them do science, and the captain’s been fighting hard to keep them up here. Now there’s trouble, they won’t be pushing so hard to go down, but the pressure’s got to go someplace. I’m leaving you a skeleton crew to deal with it.”

“We’ll get it done, sir.”

“Good man. The biggest threat we’ve got on the board is the *Rocinante*. Used to be Martian military before it went OPA. *Israel* is huge, but we’re a science ship. If the *Rocinante* knocks us down, we’re going down.”

“Why would they shoot us down?”

Murtry shrugged. “I think less about why and more about if. So... there’s something I need, and it’s going to play hell with your shuttle schedules, but I want you to do it anyway.”

“Of course.”

“We’re taking one of the light shuttles for the drop,” Murtry said slowly, as if he were thinking it through while he spoke, even though that clearly wasn’t the case. “The one that’s left? I want you to weaponize it. Take off anything that’d keep its reactor from overloading, and set it with a hardened remote ignition. Lock out all the standard nav controls and put in something that just you and me have access to.”

“Captain Marwick too?”

Murtry’s smile was an enigma. “Sure, if you want.”

“Give me half a day, I’ll get it done,” Havelock said.

“Good.”

“Sir? Who are you thinking we’d be using this against? The Belter camp?”

“We’re just buying options, Havelock. I hope not to use it at all,” Murtry said. “But if I decide I’m going to, I’ll want it fast.”

“You’ll have it.”

“I feel better knowing that,” Murtry said, and put his hand on the desk to push off.

“Sir?”

Murtry lifted his eyebrows. Havelock felt a sudden flush of embarrassment, and almost didn’t go on. And then he did.

“I know it’s a small thing, sir, but when I was on the call, Cassie said she was hungry. I told her we’d bring her a sandwich.”

Murtry’s expression was empty as stone.

“I was wondering if you could take her a sandwich, sir.”

“Might could manage,” Murtry said, and Havelock couldn’t tell if the man was amused or annoyed. Maybe both.

Havelock floated at his desk. The cells of the brig were all empty. His skeleton crew—the four most junior security staff and a technician they’d borrowed from the ship’s maintenance crew—were quietly modifying the one remaining light shuttle. Making the bomb. On his monitors, the shuttle drop and the *Rocinante*’s final deceleration burn, and the internal monitors of the station with Cassie and Doctor Okoye, each had their own window.

Havelock watched them all, waiting for the next thing to go wrong. Every minute seemed to stretch. The air recycler hummed and clicked. He chewed his thumbnail.

When the incoming message chime sounded, he started and had to put his hands to the console to keep from drifting off. He shifted to his message queue. The new one came from the RCE corporate offices on Luna, and the subject was listed as POSSIBLE STRATEGIES FOR DEESCALATING CONFLICT ON NEW TERRA: CALL FOR INPUT. The timestamp was five hours ago.

Somewhere out near the ring gates, the radio signals had passed each other, waves of electromagnetism passing through the void with human meanings coded into them. The distance it had taken a year and a half to travel in person, the message had managed in five hours.

Five hours, and still too goddamn slow.

Chapter Eleven: Holden

The *Rocinante* did the last of its deceleration burn on a tail of white fire and dropped into a high orbit around Ilus. Below, the planet looked enough like Earth that the fact that it didn't look like Earth was unsettling. Holden had looked down on alien worlds before. The rust red and white of Mars, the swirls and eddies of Saturn and Jupiter. They were totally unlike Earth's blue and brown and white. But Ilus had open sea and sky with puffs of cloud, all the markers that Holden's brain connected with his home world.

Except that there was only one large continent, and thousands of islands strung across its one giant ocean like brown beads on a necklace. The mix of alien and familiar made his head hurt.

"*Rocinante*," the *Edward Israel* broadcast at them. "Why are you target locking us?"

"Uh..." Holden slapped at the comm panel until he opened a channel to them. "No, that's just standard range finding, *Israel*. Nothing to worry about."

"Roger that," a not quite convinced voice replied from the other ship.

"Alex," Holden said, switching to the internal channel. "Please stop poking the bear."

"Roger that, Cap," Alex said, exaggerating his drawl and stifling a laugh. "Just lettin' the locals know there's a new sheriff in town."

"Stop it. Give us an hour for the final check and get us dirtside."

"Okey dokey," Alex said. "Long time since I landed one of these."

"Is it going to be a problem?"

"Nope."

Holden climbed out of the ops chair and floated to the crew ladder. A

few minutes later he was on the airlock deck with Amos. The mechanic had laid out two suits of their Martian-made light combat armor, a number of rifles and shotguns, and stacks of ammunition and explosives.

“What,” Holden said, “is all this?”

“You said to gear up for the drop.”

“I meant, like, underwear and toothbrushes.”

“Captain,” Amos said, almost hiding his impatience. “They’re killing each other down there. Half a dozen RCE security vanished into thin air, and a heavy lift shuttle got blown up.”

“Yes, and our job is not to escalate that. Put all this shit away. Sidearms only. Bring clothes and sundries for us, any spare medical supplies for the colony. But that’s it.”

“Later,” Amos said, “when you’re wishing we had this stuff, I am going to be merciless in my mockery. And then we’ll die.”

Holden started a snarky reply, then stopped himself. Had anything *ever* gone the way he planned? “Okay, one rifle each, but disassembled and in a duffel. Nothing visible. And light torso armor only. Something we can hide under our clothes.”

“Captain,” Amos said with mock surprise. “Have you actually *learned* from your past? Is this a new thing you do now?”

“Why do I put up with your shit?”

“Because,” Amos said, starting to strip an assault rifle down to its component parts, “I’m the only one on the ship that can keep the coffee maker running.”

“I’m off to get underwear and a toothbrush.”

The *Rocinante* would have lit the night sky of Ilus during the final part of her deceleration burn. When she landed in a field outside of the colony’s ramshackle town, she’d kicked up a dust cloud a kilometer across, and the noise of her descent should have rattled windows twice that far away.

So Holden was a little surprised and disappointed when no one was there to greet them.

He was the joint OPA and Earth mediator, personally selected by Chrisjen Avasarala of the UN and Fred Johnson, leader of the OPA as much

as the OPA could be led, to oversee the settlement talks. In other places, that would merit a formal greeting by the planetary governor and possibly a marching band. Holden would have settled for a ride into town.

He hefted his two heavy bags and started to trudge toward the settlement. Amos carried three. The third was the one he called his *everything has gone to shit* bag. Holden sincerely hoped they never had to open it.

When they were far enough away, Holden sent the signal to Alex and the *Rocinante* blasted off again, kicking up a massive dust storm for a few seconds.

“You know,” Amos said conversationally, “we landed so far from town to avoid blowing dust on the locals, and they couldn’t even be bothered to send out a cart to pick us up? Seems ungrateful.”

“Yeah. A little annoyed at that myself. Next time I have Alex land right in the damn town square.”

Amos gestured with his head at a massive alien structure rising in the distance. It looked like two thin towers of glass twisted together, like a pair of trees growing beside each other.

“So, there’s that,” he said.

Holden had no reply. It was one thing to read about “alien ruins” on the location report. It was another thing entirely to see a massive construct built by another species towering over the landscape. How old was it? A couple billion years, if Miller could be believed on how long the protomolecule masters had been gone. Had humans ever built anything that would last that long?

“According to the security wonks on the *Israel*, that’s where they think their people were massacred,” Holden said after they’d walked together for several minutes.

“Oh good,” Amos replied. “Somebody got killed there. That’s how we claim stuff, you know. This planet is officially ours now.”

Other than the admittedly hard-to-ignore alien tower, the rest of the landscape could have been the North American southwest. Hardpan dirt, with small shrublike plants. Small creatures scurried away at their approach. For a few moments they were surrounded by a cloud of biting insects, but after a number of them bit, drank their blood, and dropped dead, the rest seemed to pick up that humans weren’t food and lost interest.

The colony itself looked like a shantytown. A ramshackle mix of prefab buildings and lean-tos made out of scrap metal and brick. A few were made of mud, so someone had decided to try using adobe. Something about the idea of humans traveling fifty thousand light-years and then building houses using ten-thousand-year-old technology put a smile on Holden's face. Humans were very strange creatures, but sometimes they were also charming.

A mob had gathered at the center of town. Or, more accurately, at the intersection of the only two dirt roads. Fifty or so colonists were facing off with a dozen people in RCE uniforms. They were shouting at each other, though Holden couldn't make out the words.

Someone on the edge of the crowd noticed them walking into town and pointed. The arguing died down, and then the entire crowd surged toward Holden and Amos. Holden dropped his bags and waved, smiling. Amos smiled too, though he casually rested his hand on the butt of his pistol.

A tall, stocky woman a few years older than Holden rushed over to him and grabbed his hands. Holden was almost certain she was Carol Chiwewe, but if that were true, she'd changed a lot since the picture in his briefing files had been taken.

"Finally! Now you need to tell these goons—"

Before she could finish or Holden could respond, the rest of the crowd started shouting at him all at once. Holden could hear snatches of their demands: that he drive off RCE, that he give them food or medicine or money, that he let them sell their lithium, that he prove that the colony had nothing to do with the disappearance of the security officers.

As Holden tried to quiet the mob, an older man in an RCE security uniform strolled slowly toward him, the rest of the corporate security people following in a wide V, like a flock of geese.

"Please, stop. I'll hear out each and every one of your requests once we get settled in. But we can't do anything if you all yell at—"

"Chief Murtry," the RCE man said, moving through the crowd like it wasn't there, sticking his hand out and smiling. "Royal Charter Energy, head of expedition security."

Holden shook his hand. "Jim Holden. Joint UN/OPA mediator."

The crowd hushed and moved away, creating a small circle of calm with Holden and Murtry at its center.

“Those were your people that disappeared,” Holden continued.

“They got murdered,” Murtry corrected him, not losing his smile. The man made Holden think of a shark. All bared teeth and cold black eyes.

“My understanding is that that was not proven.”

“It’s true they cleaned up the scene. But I have no doubt.”

“Until *I* have no doubt, no punitive action is to be taken,” Holden said. He felt Amos move up closer behind him, a silent threat.

Murtry’s smile didn’t reach his eyes. “You’re the boss.”

“Mediator,” Holden said, his tone letting Murtry know that as far as he was concerned, it meant the same thing.

Murtry nodded and spat to one side.

“Sure.”

The dam broke, and the crowd rushed back in toward them, a tall woman pushing her way to the front. She jabbed her hand at Holden in an angry demand for a handshake. If Murtry had gotten one, she was going to get one too.

“Carol Chiwewe, colony coordinator,” she said giving his hand two firm pumps. So that first woman had to have been someone else.

“Hello, madam coordinator,” Holden started.

“This man,” she continued, stabbing her fingers at Murtry, “is threatening us with martial law! He claims that the charter gives RCE the right to—”

“Enforce the laws of the UN charter, and keep the peace,” Murtry said, somehow managing to talk over the top of her without raising his voice.

“Keep the peace?” Carol said. “You gave your people a shoot-first directive!”

The crowd rumbled in disapproval at this, and the shouting started up again. Holden waved his arms to calm them back down. He hoped it looked more dignified and commanding than it felt. When Murtry spoke, his voice was calm but hard.

“I have a hard time seeing how we’d be shooting first. Everybody that’s died so far, your people killed. I won’t tolerate any further threats against RCE employees or property.”

A tall man with the large cranium of someone raised in the Belt pushed his way to the front. “Sounds like a threat right there, mate.”

“Coop, please, don’t make this worse,” Carol said with a resigned sigh.

Ah, Coop is a troublemaker, Holden thought, making a note to remember the face.

“Just seems to me,” Coop said, turning to look back at the mob with a grin, raising his voice to play to the crowd. “Just seems to me that the only one making threats right now is *you*.”

The crowd rumbled encouragement, and Coop grinned from ear to ear, enjoying the power that came from giving the mob a voice.

Murtry nodded at him, still smiling. “There isn’t anything I won’t do to protect the lives of my team, that’s true. And we’ve lost too many already to take further chances.”

“Hey, don’t blame us, mate, if you can’t keep track of your people.” Someone in the crowd laughed.

“Don’t worry,” Murtry said, his smile still didn’t change, but he stepped in close to Coop. “I’ll find out what happened to them.”

“Maybe *you* should be careful,” Coop said, looking down at the shorter man, his grin turning feral. “Or, you know, it might happen to you too.”

“That,” Murtry said, drawing his gun, “was definitely a threat.”

He shot Coop in the right eye. The Belter man went limp and dropped like a machine that had been unplugged. Holden’s own gun was in his hand and pointed at Murtry even before he fully processed what had just happened. Amos stepped up next to him, his pistol trained on the RCE security chief. The entire RCE team pulled weapons and aimed them back at Holden. The crowd was deathly silent.

“What the *hell*!” Holden said. “I just said no punitive action. I mean, I just *said* that.”

“You did. That wasn’t punitive action, it was a response to a direct verbal threat.” Murtry put his pistol away and turned back to Holden. “We’ve established martial law here, under article 71 of the UN charter for exploration of this world. Any threat to RCE personnel will be dealt with swiftly and with prejudice.”

He stared at Holden for several long seconds, then said, “Might should put your gun away, Captain.”

Amos took a half step forward, but Holden put a hand on his arm. “Put it away, Amos.” He holstered his own gun, and a second later the RCE team did the same.

“I’m glad we could establish this working rapport so quickly. I’d

recommend you get settled in,” Murtry said. “I’ll come by for a visit later.”

The coordinator had set aside rooms for Holden and Amos in the large, boxy prefab warehouse structure that had been converted into a combination of general store, commissary, and pub. The rooms in back were furnished with a cot, a table, and a water basin for washing.

“They gave us the presidential suite, I see,” Amos said, dumping his bags on the floor of his tiny room. “I need a drink.”

“Give me a second,” Holden said, then went into his own room and called up to the *Rocinante*. He delivered a full report of the landing and the shooting of Coop. Naomi promised to beam it back to Fred and Avasarala for him, and told him to be careful.

The bar, such as it was, consisted of four shaky card tables and twenty or so chairs scattered near the commissary corner of the building. Amos was waiting with two bottles of beer when Holden finished up his report.

“That went well.”

“Get the feeling we may be in over our heads here?” Amos asked after a few companionable sips of beer.

“Feels about normal to me,” Holden replied.

“Yep.”

They were on their second beer each when Murtry arrived. He talked to the bartender for a minute, then sat down across from Holden and put a bottle of whiskey and three glasses on the table.

“Have a drink with me, Captain,” he said, pouring out three shots.

“You’re going to go to prison for what you did today,” Holden said, then tossed back his shot. The whiskey had the sour moldy taste of Belter distillations. “I plan to make sure of that.”

Murtry shrugged. “Maybe. My plan is to make sure all my people survive long enough for prison to be an issue. I’ve lost almost twenty now, between the attack on the shuttle and the murder of my ground team. I won’t lose any more.”

“You’re a corporate security detail. You don’t get to declare martial law and shoot people who don’t cooperate. I wouldn’t put up with that from legitimate governments, much less a rent-a-cop like you.” Holden poured

himself another drink and sipped at it.

“What’s the name of this planet?”

“What?”

“The planet. What’s its name?”

Holden leaned forward, the word *Ilus* on his lips. He paused. Murtry’s smile was thin.

“You’ve spent a lot of time working for the OPA, Captain Holden. And you’re on record as harboring a deep-seated dislike of the kind of business that employs me. I have some reservations about your ability to address the situation here in an unbiased manner. Threatening me and calling me names doesn’t do much to reassure me.”

“You undermined my authority by killing a Belter within five minutes of my arrival,” Holden said.

“I did. And I understand that could make you feel that I’m not taking your role here seriously. But your friends in the UN are a year and a half away,” Murtry said. “Think about that. It takes between eight and eleven hours to have the first two exchanges of a conversation, and almost nineteen months to get here from there at civilian speeds. Our local governor has been murdered by terrorists. My people have been killed for trying to enforce our legal rights. Do you honestly think I’m going to wait for you to fix what’s wrong here? No, I’ll shoot everyone who threatens the RCE expedition or its employees, and I’ll sleep well afterward. That’s the reality of where you are now. Better get used to it.”

“I know who you are,” Amos said.

The big man had been so quiet that both Murtry and Holden started with surprise.

“Who am I?” Murtry asked, playing along.

“A killer,” Amos said. His face was expressionless, his tone light. “You’ve got a nifty excuse and the shiny badge to make you seem right, but that’s not what this is about. You got off on smoking that guy in front of everyone. You can’t wait to do it again.”

“Is that right?” Murtry asked.

“Yeah. So, one killer to another, you don’t want to try that shit with us.”

“Amos, easy,” Holden warned, but the other two men ignored him.

“That sounded like a threat,” Murtry said.

“Oh, it really was,” Amos replied with a grin.

Holden realized both men had their hands below the table. "Hey, now."

"I think maybe one of us is going to end bloody," Murtry said.

"How about now?" Amos replied with a shrug. "I'm free now. We can just skip all the middle part."

Murtry and Amos smiled at each other across the table for an endless moment while Holden ran through contingencies in his mind: *What if Amos gets shot, what if Murtry gets shot, what if I get shot.*

"You fellas have a nice day," Murtry said, standing slowly. His hand was not on his gun. "Keep the bottle."

"Thanks!" Amos replied, pouring another drink.

Murtry nodded at them, then walked out of the bar.

Holden let out an exhalation that he'd been holding for what seemed like an hour. "Yeah, I think we are in way over our heads here," he admitted.

"I'm gonna need to shoot that guy at some point," Amos said, then tossed back another shot.

"I wish you wouldn't. This is already looking like a train wreck, and in addition to chewing up a few hundred colonists and scientists, which is bad enough, it will also be my fault when it all falls apart."

"Shooting him might help."

"I hope not," Holden said, but he was worried that Amos was right.

Interlude: The Investigator

—it reaches out it reaches out it reaches out it reaches out—

One hundred and thirteen times a second, nothing answers and it reaches out. It feels no frustration, though parts of it do. It is not designed to incorporate consciousness or will, but to use whatever it finds. The minds within it are encysted, walled off. They are used when they are of use, as is everything and it reaches out.

It is not a plan. It is not even a desire, or it is only a desire without knowledge of that longing's object. It is a selective pressure pressed against chaos. It does not think of itself this way because it does not think, but the environment changes, a new branch of possibilities opens, and it forms the investigator and leans into the new crack. The new space. The minds within it interpret this differently. As a hand reaching up through graveyard soil. As finding a door in a room where no door had been before. As a breath of air to a drowning woman. It is not aware of these images, but awareness of them is part of it.

The investigator puts pressure on the aboriginal, and the aboriginal takes action. The environment changes again. Patterns begin to match patterns, but there can be no recognition because it is not conscious to recognize. It would be aware of the aboriginal accelerating, of it slowing, the vectors shifting zero to one to a different zero in a different location, if it were aware, but it is not aware. It reaches out.

Patterns match, and it reorients and reaches out. Cascades of implicit information bloom, and the conscious parts of it see a lotus opening forever, hear a shout that is made of other shouts that are made of other shouts in a fractal constructed of sound, pray to God for a death that does not come.

It reaches out, but the ways in which it reaches change. It improvises, as

it always has, the insect twitch, the spark closing the gap it reaches out.

It touches something, and for a moment, a part of it that can feel, feels hope. It is unaware of hope. The reply does not come. It is not over. It will never be over. It reaches out, and finds new things. Old things. It flows into places that are comfortable for it to flow. There are responses, and the responses feed the impulses that caused them, and there are more responses. All automatic and empty and dead as it is. Nothing reaches back. It feels no disappointment. It does not shut down. It reaches out.

It does not experience the wariness, but the wariness is part of it. It reaches out, rushing into the new possibility space, and something deep in it, wider than it should be, watches it reach.

Doors and corners. It reaches out it reaches out it reaches out. Doors and corners.

This could get ugly, kid.

Chapter Twelve: Basia

James Holden came too late.

Along with everyone else in the colony, Basia watched the drive plume of the *Rocinante* light the sky of Ilus. For him, maybe, it was already too late. He'd made the bombs that destroyed the RCE shuttle and killed the UN governor. He'd been there when Coop and the others murdered the RCE security team. And maybe there was no coming back from that. Maybe he was already a dead man, or a man destined for life in prison, the same thing really. But looking up at the line of white fire in sky, he couldn't help but feel a spark of hope. Jim Holden had saved the Ganymede children, too late for Katoa, but he'd saved the others. He'd brought down the evil corporation that had killed Basia's little boy. Neither Mao-Kwikowski nor Protogen existed anymore because of Holden. And while Basia had never met the man in person, he'd watched him on video casts and read about him in newsfeeds. It created a strange sense of intimacy, to watch the man who'd avenged Katoa on-screen, talking and smiling.

And that man was coming to Ilus. Perhaps he could save Basia too?

So when the bright line in the sky vanished, and Basia knew Holden and his crew were in orbit, he let himself feel a swell of hope. The first he'd felt in a long time.

And when he heard the thunderclap of a descending shuttle, he ran outside just like all the other colonists, watching to see where it would land. *The UN mediator is coming!* they shouted to each other. The man who saved Earth, they meant. The man who saved Ganymede. The man who will save us.

A small shuttle dropped out of the sky and settled on the hard-packed

earth to the south of First Landing, and half the town's population ran to meet it. Basia ran too.

The shuttle sat on five squat legs, ticking with heat. The town waited in silence, too excited to talk. Then a ramp lowered to the ground, and a squat Earther with gray hair and a deeply lined face walked down it. It wasn't Holden. One of his crew, maybe? But the man was wearing armor with the RCE logo on it, and Holden was supposed to be an impartial mediator.

The man stopped halfway down the ramp and smiled a humorless smile at them. Basia realized he was holding his breath, then realized everyone else was too.

"Hello," the man said. "My name is Adolphus Murtry. I'm chief of security for Royal Charter Energy."

Was it another RCE ship they'd seen braking into orbit? The man walked down the ramp, still smiling that predator's smile, and as one the crowd backed away. Basia backed up with them.

"Because of the attack on the shuttle that claimed the lives of many RCE employees *and* UN officials, I am taking direct control of security on this world. If that sounds like martial law, that's because it is." Murtry whistled, and ten more people in security armor descended the ramp. They carried automatic weapons and slug-throwing sidearms. Not a non-lethal deterrent in sight.

"Please be aware," Murtry continued, "that because of the attack on the first security team—"

"No one proved they were attacked!" someone shouted from the crowd. Coop, it was Coop. Standing at the back with his arms crossed and a smug smile on his face.

"Because of that attack," Murtry continued, "I have given my people 'shoot first' authorization. They may, if they feel threatened, utilize lethal force to defuse the threat."

Carol pushed through the crowd to confront Murtry at the bottom of the ramp, and Coop followed her.

"You're not the government here," Carol said, anger making the tendons in her neck stand out. Her hands were in fists, but she kept them at her sides. "You can't just land here with a bunch of guns and tell us you have the right to shoot us. This is *our world*."

"That's right!" Coop yelled and turned to face the crowd, inviting them

to join in.

“No,” Murtry said, his smile not changing, “it is not.”

The air was split with thunder as another ship dropped into the atmosphere and landed on the western side of town. Murtry barely glanced up at it. *More troops dropping in*, Basia thought.

Murtry began walking toward town, his people trailing out behind him, and the crowd moving in a loose cloud around them. Carol kept talking, but her words had no effect. Murtry just smiled and nodded and didn’t break stride. The ship that had landed on the other side of town blasted off on a column of white vapor and vanished from sight. The roar of its engines filled the world.

When they reached the center of town, Basia saw Jacek hanging around at the edge of the crowd. He grabbed his son by the arm, pulling him harder than he intended, and the boy gave a frightened squeak.

“Papa,” he said as Basia dragged him away, “am I in trouble?”

“Yes,” Basia shouted, then when he saw tears welling up in the boy’s eyes stopped and dropped to his knees next to him. “No. No, son. You’re not. But I need you to go home.”

“But—” Jacek started.

“No buts, boy,” Basia gave him a gentle shove toward their house. “Go home.”

“Is that man going to kill us?” Jacek asked.

“What man?” Basia asked, but it was a delaying tactic. He knew what man. Even his little boy could smell the death coming off of Murtry and his people. “No one’s going to kill us. Go home.”

Basia watched Jacek walk home, waiting until he saw the boy go inside and close the door. Basia was just starting to walk back toward the crowd when the shot rang out.

His first thought was, *Jacek was right. They are killing us.*

Not *us*, though, once he got back to the crowd. Just Coop, lying in the dust with a red hole where his eye should be, blood pooling under his head.

And Holden, jaw clenched and eyes wide.

Too late, Basia thought. *Too late again.*

People with machine guns walked the streets of First Landing.

Basia and Lucia sat on their tiny front porch and watched them pass by in the fading sunlight of early evening. A man and a woman, both in body armor with the red-and-blue RCE company logo on it. Both carrying automatic weapons. Both with hard expressions on their faces.

“I did this,” Basia said.

Lucia squeezed his hand. “Drink your tea, Baz.”

Basia looked down at the cup of tea cooling on his lap. All the tea the little colony might ever have had come down on the shuttles with them. To waste such a luxury was unthinkable. He sipped at the lukewarm cup and didn’t taste it.

“They’ll kill me, next.”

“Maybe.”

“Or put me in jail forever, take me away from my family.”

“You,” Lucia said, “took yourself away when you joined with those stupid violent people who blew up the shuttle. You drove them out to the ruins when they killed the RCE people. You made every choice that took you to this place. I love you, Basia Merton. I love you till my chest aches. But you are a stupid, stupid man. And when they take you away from me, I will not forgive you for it.”

“You’re a harsh woman.”

“I’m a doctor,” Lucia said. “I’m used to giving people bad news.”

Basia drank off the rest of his tea before it could finish getting cold. “I could get some rope or chain from the dig site. Maybe hang a bench here. Then we could rock while we sit.”

“That might be nice,” Lucia said. The pair of RCE guards reached the end of the street and turned around to come back. With the sun about to dip below the horizon, their shadows were almost as long as the town itself.

“We’ve been focusing on lithium mining to get money,” Basia continued. “But we need to start thinking about our own energy needs.”

“This is true.”

“We can’t have the *Barb* bringing us power cells forever. And someday the ship will fly back to Pallas to sell the ore. So we won’t have her for a couple years.”

“Also true,” Lucia said. She swirled the last of her tea and stared up at the stars. “I miss having Jupiter in the sky.”

“It was beautiful,” Basia agreed. “I have to go meet with Cate and the others tonight, after it gets dark.”

“Baz,” Lucia started, then just stopped with sad sigh.

“They’ll want revenge for Coop. It will only make it worse.”

“What,” Lucia said, “does worse look like, I wonder?”

Basia sat quietly, thinking of the rocker he could build on their porch. Of adding a bigger water heater for hot baths. Of building a larger kitchen and dining area on the back of the house. Of all the things he wouldn’t get to do now.

The guards were at the end of the town’s long street, almost invisible in their dark armor and the fading light. Basia got up to leave.

“Can you stop them from killing anyone else?” Lucia asked, as though she were asking if he wanted more tea.

“Yes,” Basia replied. It felt like a lie.

“Then go.”

They met at Cate’s house. Pete and Scotty and Ibrahim. Even Zadio came, her wife Amanda staying home to look after their boy and his infected eye. That wasn’t a good sign. Of all of them, Zadio was the angriest. The one with the hottest head. Basia had worked with her on Ganymede, and more than once she’d shown up in the morning with a black eye or a busted lip from some bar fight she’d picked the night before. They were all upset, all standing on the ledge about to jump, but Zadio would be the hardest to talk off of it.

“They shot Coop,” Cate said when Scotty, the last of them to arrive, finally came in. It wasn’t a statement of fact. They’d all been there. They’d all seen it. No, it was the beginning of a justification.

“In cold blood,” Zadio said, and punctuated it with a fist to her palm. “We all saw it. Just shot him in the face in front of God and everyone.”

“So I have a plan,” Cate continued. “The RCE people are holed up in—”

“Who put you in charge?” Zadio asked.

“Murtry did.”

Zadio narrowed her eyes, but let it drop. Basia fidgeted on one end of Cate’s couch. It was a handmade frame, covered with padding stripped from

the ship and badly stitched remnants of the cloth they had the fabricator crank out once a month for clothing and other needs. Cate had made a small table out of the local wood analog to sit next to it. It wasn't quite level, and Basia's glass of water was at a noticeable tilt. Pictures of Cate's family, two sisters who still lived back in the Belt and their kids, hung on the walls. There was a pottery vase on the floor with sticks and branches in it that Basia thought was meant as decoration, not kindling.

It was too domestic a location for the kind of meeting they were having. It all felt unreal, that he and five people he knew were discussing the murder of a dozen corporate security guards in Cate's living room next to her vase full of sticks.

Scotty was talking, telling them to wait. Not the voice of reason, the voice of fear. Pete was on his side, arguing against escalating. Cate and Zadie shouted them down. Ibrahim said nothing, just pulled on his bottom lip and frowned at the floor.

"I think we wait for Holden," Basia said when there was a pause in the conversation.

"Holden's been here a day. What are we waiting for?" Cate asked, dripping angry sarcasm.

"He needs time to meet with us, get the lay of the land," Basia said, the words sounding feeble even in his own ears. "But he's the mediator. And he can talk directly to the OPA governing board and to the UN. His recommendations will have real weight. We need him on our side."

"The OPA?" Zadie spat. "The UN? What exactly are they going to do for us? Send a tersely worded letter? Murtry and his thugs are right there!" Zadie stabbed her fingers at the wall, at the street beyond, at the guards with machine guns. "How many of our people do they get to kill before we defend ourselves?"

"We killed them first," Basia said, then regretted it immediately. Everyone started shouting, mostly at him. Basia stood up. He knew he was an imposing figure, stocky and thick-necked. Bigger than anyone else in the room. He stepped forward, a physical challenge. He hoped his size would be enough. He was fairly certain Cate could beat him to death if she decided to. "Shut up!" They did. "We have a chance here," he continued, quieting his voice with an effort. "But it's so fragile. We killed the RCE people."

"I wasn't—" Zadie started, but Basia hushed her with a gesture.

“They killed Coop. Right now, they feel like they’ve made a point, so they won’t kill anyone else unless we provoke them. So, right now, we are at a balance. If no one does anything to tip it one way or another, Holden can do what they sent him here to do. He can help us resolve this without more violence.”

Cate snorted and looked away, but Basia ignored her. “I’m in this with you. I have just as much to lose as any of you. But we want this man on our side. He saw Murtry murder one of us. He’s never seen us do anything. We have the advantage of seeming like the victims right now. Let’s not change his mind on that.”

There was a long moment while Basia stood in the middle of the room, panting with emotion, and no one spoke.

“Okay,” Ibrahim said. He’d been a soldier once. The others respected him. When he finally spoke, it was with a tone of authority. Cate frowned, but said nothing.

“Okay?”

“Okay, big man,” Ibrahim said. “We play it your way for now. Go talk to this Holden. Get him on our side. He’s the one found your boy, sa sa? Use that.”

Basia felt a rush of anger and shame at the mention of Katoa, of using him as an in with Holden, but he pushed it down. Ibrahim was right. It would give Basia something to talk to Holden about, and it would make him seem sympathetic.

“I’ll talk to him tomorrow,” Basia said, swallowing the sudden nausea he felt.

“It’s on you now, big man,” Ibrahim said. It sounded like a threat.

Basia walked home in the pitch black of the Ilus night. He wished he’d thought to bring a light. He wished he’d never blown up a shuttle full of people and helped Coop murder the RCE guards. He wished his wife wasn’t angry with him, and that she wasn’t right. He wished that Katoa were still alive and that they all still lived in their home on Ganymede and that no one had ever come to Ilus in the first place.

He tripped on a rock and fell to his knee, skinning it. No way to fix the

other things, but at least he could have thought to bring a light.

Lucia had left a light on in the house. Without it, Basia might have walked right past it without realizing. At least she wanted him to come home. She left lights on to make it happen. For the first time in a long time, Basia felt himself smile.

A shadowy figure darted through the dim light around the house to the back door. Before he had time to think, Basia was at a dead run. The figure at the door cowered, smaller than him and terrified.

Felcia.

“Papa! You scared me!”

“Oh, baby, I’m so sorry. I didn’t see it was you. Just saw someone sneaking around the house and came running.”

Felcia smiled up at him, eyes damp and lip trembling, but being brave.

“Okay, going in now.”

“Felcia,” Basia said, putting his hand against the door to hold it closed. “Why are you sneaking up to the house in the middle of the night?”

“I was out, walking.” She looked away, not able to meet his eyes.

“Please, baby, tell me it was a boy.”

“It was a boy,” she said, still not looking at him.

“Felcia.”

“I’m going up on the next shuttle, Papa,” she said, looking him in the eye finally. “I’m going up. When James Holden gets them to let the *Barbapiccola* go, I’m going with it. From Pallas I can catch transport to Ceres. Mama is calling her old mentor at CUMA to get me an interview for the pre-med program at the Hadrian on Luna.”

Basia felt like someone had punched him in the solar plexus. The pain in his stomach kept him from breathing.

“I’m going, Papa.”

“No,” he said. “You’re not.”

Chapter Thirteen: Elvi

Elvi's grandfather had remarried late in life. His new husband had been a German man with a merry laugh, a snow-white beard, and a cheerful cynicism about humanity. What she remembered best about Grandpa Raynard was how quick he was with an epigram or a quip. He had one for every occasion. She'd thought they made him sound worldly and wise, in part because she was so often unsure what exactly he meant by them.

One thing he'd said was *Once is never. Twice is always.*

When the shuttle went down, she'd known—they'd all known—that someone had put the explosives there, but her experience of the Belter colonists beginning that same night had been so different that the knowledge and the emotional impact of it had become detached. Someone among the Belters had done a terrible thing, but that person was faceless, anonymous, unreal. Doctor Merton doing everything she could to save the wounded and soothe the injured was real. Her daughter, Felcia, who was at the farthest point humanity had ever been from Earth and whose ambitions were drawing her back toward Luna, was real. Anson Kottler and his sister Kani who'd helped Elvi set up her hut. Samish Oe with his goofy half smile was real. Carol Chiwewe. Eirinn Sanchez. They had all been so kind that Elvi had shelved the death of the governor as an outlier, something so rare it would never happen again.

But the disappearance of Reeve and the security crew was twice, and the way Elvi saw the colony and the RCE scientists and her own little hut out on the edge of the plain was different now. Because the threat of violence wasn't *never* anymore. It was *always*.

"Did you see anything else?" Murtry asked.

“No,” Elvi said. “I don’t think so.”

“Doctor Okoye, I know this has been unpleasant for you,” the chief of security said, “but I need to you try to remember if there was anything else you saw while you were out there. The person you saw coming back. Can you say if it was a man? A woman?”

That wasn’t how memory worked, of course. Just willing herself to remember something, pushing herself, was much more likely to generate a false recollection and add bad data to the set than it was to haul up some telling detail she’d failed to mention. It seemed rude to explain that to Murtry, so Elvi only shook her head.

“I’m sorry,” she said.

“It’s all right,” he said in a tone of voice that hinted strongly at his disappointment. “If anything else occurs to you, please do bring it to me.”

“I will.”

“Are you feeling okay?”

“I guess so. Why?”

“The UN mediator’s asked to talk with you too,” Murtry said. “You don’t have to if you don’t want, though. Just say the word, and I’ll tell him to go piss up a rope.”

“No, I don’t mind,” she said, but she was thinking, *James Holden wants to talk to me?* “Should I... I mean, is there anything I should particularly tell him? About the work, I mean?”

The truth was, she just wanted to get out of the security offices. The extended thirty-hour day of New Terra made it hard to feel exactly how long she’d been there, but she’d come to Reeve in darkness, she’d slept in one of the cells that night. She’d stayed there while Murtry and the security team came down and made the town safe, and now it was morning again. So two days, New Terra. Maybe three back on Earth. What exactly *day* meant wasn’t intuitive anymore.

“Captain Holden needs to understand exactly how bad our situation here is,” Murtry said. “He came out here thinking there’s two sides to this, so he’s wanting to split some kind of difference. Anything you can do to help him understand why that’s not the solution here, I would very much appreciate.”

“Oh,” she said. “Yes, of course.”

“Thank you,” Murtry said.

“One thing?”

Murtry raised his eyebrows and tilted his head toward her. He didn’t quite say, *Yes, ma’am?* but it was physically implied.

“My research is still in my hut,” she said. “I have some studies that were in progress when I came to talk to... when I came in. Is my hut off-limits, or will I be able to get back to them?”

“You’ll go back,” Murtry said. “The one thing that is not going to happen here, Doctor? We’re not giving back a goddamn centimeter of our ground. Whoever did this doesn’t get to win.”

“Thank you,” Elvi said.

Murtry’s expression hardened for a moment. His eyes became flat in a way that Elvi associated with lab animals being sacrificed. He looked dead.

“You’re welcome,” he said.

Walking down the street of the town, Elvi felt a pang of unease, but less so than she’d expected. The little siege she’d suffered in the security office waiting for the relief team to come had been a bleak and frightening time. But now familiar faces had joined the townsmen. Two women in RCE security riot armor walked down the street across from her, their assault rifles resting easily in their hands. Just seeing them there left Elvi feeling safer. And then Holden had also arrived. Certainly, things weren’t where they needed to be, but they were getting closer. They were getting better. That would have to be enough for now.

Another guard stood at the entrance to the general store, a rifle resting in his hands.

“Doctor Okoye,” he said nodding her inside.

“Mister Smith,” she said.

She’d been in the commissary building many times in the weeks since she’d landed on New Terra. Apart from little intimate get-togethers in the research huts and the formal town meetings in the community hall, it was the only place to go unless she found religion. She could see—*feel*—at once how the presence of James Holden had changed the nature of the space. It had been a community place before, public in the same way a municipal park might be, without any commanding human presence. Now a man sat at

a table toward the back of the room, just as if he were a townsman getting a bowl of rice and a beer. Sitting there, leaning on his elbows and talking to Fayeze, he commanded the space. He owned it. What had belonged to everyone was now the unquestioned domain of James Holden. Elvi's belly went a little tighter and anxiety sped her breath.

She had seen Holden on the newsfeeds and reports. At the beginning of the war between Mars and the Belt, he had been the most important man in the solar system, and the celebrity, while it had waxed and waned over the years, had never gone away. James Holden was an icon. For some, he was the symbol of the triumph of the single ship over governments and corporations. For others, he was an agent of chaos who started wars and threatened stability in the name of ideological purity. But whatever people thought he meant, there was no question that he was important. He was the man who'd saved Earth from the protomolecule. He was the man who'd brought down Mao-Kwikowski. Who'd made the first contact with the alien artifact and opened the gates that led to a thousand different worlds.

In person, he looked different than his image on the screen. His face was still broad, but not as much so. His skin had a warmth that even years in the sunless box of a ship couldn't erase. The dark brown hair had a dusting of gray at the temples, but his eyes were the same sapphire blue. As she watched, Holden rubbed a hand across his chin, nodding at something that Fayeze was saying. It was an unconsciously masculine movement that left Elvi thinking of large animals—lions, gorillas, bears. There was no sense of threat in it, only of power, and she was profoundly aware that the man she had seen only as an image on a data feed was exhaling the same molecules that she was breathing in.

"You okay?"

Elvi started. The man who'd asked was huge, pale, and muscular. His shaved head and thick belly made him look like a gigantic baby. He put a hand on her shoulder as if to steady her.

"Fine?" she said, her inflection making it a question.

"You just looked a little weird there for a second. You sure you're feeling all right?"

"I was supposed to meet with Captain Holden?" she said, trying to pull herself back together. "My name's Elvi Okoye, and I'm with the RCE. I'm an exobiologist with RCE."

“Elvi!” Fayez called, waving her over.

She nodded to the pale man and walked over to the table where Fayez and Holden were sitting. James Holden’s eyes were on her.

“This is Elvi,” Fayez said. “We’ve known each other since upper university.”

“How do you do?” Elvi said, her voice sounding false and tinny in her ears. She cleared her throat.

“Pleased to meet you,” Holden said, rising to his feet and extending a hand. Elvi shook it just as if she were meeting anyone else. She was proud of herself for that.

“Sit,” Fayez said, pushing out a chair for her. “I was just talking to the captain here about the resources problem.”

“It’s not an issue yet,” Elvi said. “But it will be.”

Holden sighed, clasping his fingers together. “I’m still hopeful that we can negotiate something that’s equitable for everyone involved.”

Elvi frowned and tilted her head. “How would you do that?”

Holden lifted his eyebrows. Fayez leaned in toward her.

“We were talking about resources like lithium and money,” he said, then turned toward Holden again. “She was talking about water and nutrients. Different contexts.”

“Is there not enough water?” Holden asked.

“There is,” Elvi said, hoping that her blush didn’t show. Of course they were talking about lithium mines. She should have known that. “I mean, there’s enough water. And nutrients. But that’s sort of the problem. We’re here in the middle of a totally foreign biosphere. Everything about the place is different from what we’re used to dealing with. I mean, it looks like life here is genuinely bi-chiral.”

“Really?” Holden said.

“No one knows what that means, Elvi,” Fayez said.

Holden politely pretended not to have heard him. “But the animals and insects here all look... well, they don’t look familiar, but they’ve got eyes and things.”

“They’re under the same selection pressures,” Elvi said. “Some things are just a good idea. Back on Earth, eyes evolved four or five different times. Powered flight at least three times. Most animals put the mouth near the sense organs. The degree of large-scale morphological similarities given

the underlying biochemical differences is part of what makes this such an amazing research opportunity. The data I've been able to send back since we got here would be enough to fuel research for a generation, and I've barely scratched the surface."

"And the resources problem?" Holden said. "What are the resources you need?"

"It's not the ones we need," Elvi said, waving her hands. "It's the ones we *are*. From the perspective of the local environment, we're bubbles of water, ions, and high-energy molecules. We're not exactly the flavor that's around here, but it's only a matter of time before something figures out a way to exploit those."

"Like a virus?" Holden asked.

"Viruses are a lot more like us than what we're seeing here," Elvi said. "Viruses have nucleic acids. RNA. They evolved with us. When something here figures out how to access us as resources, it's probably going to be more like mining."

Holden's expression was dismayed. "Mining," he echoed.

"We have an advantage for the time being because we're an older biosphere. From what we can tell, things weren't really evolving here until sometime between one and a half and two billion years ago. We've got pretty strong evidence that we have a good billion-year head start on these guys, at least. And some of our strategies may work against them. If we can build antibodies against the proteins that the locals use, we might be able to fight them off like any other infection."

"Or we might not," Fayez said.

"Part of the reason I came out here, part of the reason I agreed to this, was that we were going to do it *right*," Elvi said, hearing the stress coming into her voice. "We were going to get a sealed environment. A *dome*. We were going to survey the planet and learn from it and be responsible about how we treated it. The RCE sent scientists. They sent researchers. Do you know how many of us have sustainability and conservation certifications? Five-sixths. Five-*sixths*."

Her voice was louder now than she'd meant it to be. Her gestures were wider, and there was a tremble of outrage in her words. Holden's unreal blue eyes were on her, and she could feel him listening like his attention could radiate. Intellectually, she knew what was happening. She was scared

and she was hurt and she was guilty for having been the one to lead Reeve and the others into danger. She'd been able to ignore it all, but it was bubbling up. She was talking about the biology and the science, but what she meant was *Help me. It's all going wrong, and no one can help me. No one but you.*

"Only when you got here, there was already a colony," Holden said. His voice was like warm flannel. "And a colony made up of a bunch of people who have a lot of very good reasons to distrust corporations. And governments."

"It looks calm here," Elvi said. "It looks beautiful. And it is. And it's going to teach us things we never dreamed before. But we're doing it wrong."

Fayez sighed. "She's right," he said. "I mean, I like talking about lithium and moral rights and legalities as much as the next guy. But Elvi's not wrong about how weird this place is when we start looking close enough. And it's got a lot of very dangerous edges that we're not paying any attention to. Because we're, you know, killing each other."

"I hear what you're saying," Holden said. "I'm going to need to look at it. The part where people are killing each other has to be my first focus. But I promise you both that I will put creating a closed, safe planetary dome on the list as soon as we've got the crisis under control. No matter who winds up being in control."

"Thank you," Elvi said.

"Most of the people here are good," Fayez said. "The Belters? We've been here for months, and I swear most of these people aren't monsters. They're just poor bastards who thought starting over was a good idea. And Royal Charter is a very, very responsible corporation. Look at their history, and you won't find any more graft and corruption than an average PTA. They're really trying to do all this right."

"I know," Holden said. "And I wish to hell that made it easier."

"Uh, Captain?" the huge baby-man said.

"Amos?"

"There's another mess of legal crap just came through from the UN for you."

Holden sighed. "Am I supposed to read it?"

"Don't see how they can make you," Amos said. "Just thought you'd

want to ignore it intentionally.”

“Thank you. Sort of,” Holden said, then turned back to them. “I’m afraid I have to deal with bureaucracy for a while. But thank you both very much for coming. Please always feel free to come talk to me.”

Fayez stood, and Elvi followed half a second later. He shook each of their hands in turn, then retreated to a room in the back. Fayez walked out to the street with her. Hassan Smith and his rifle acknowledged them again as they passed by.

The sun glowed in the oxygen-blued sky. She knew it was a little too small, the spectrum of light from it a little slanted toward the orange, but it was familiar to her now. As right as thirty-hour days and her close, familiar hut. Fayez fell into step beside her.

“Heading back to your place?” he asked.

“I should,” she said. “I haven’t been out since I came to see Reeve. I’m sure all my datasets are finished. I probably have a bunch of angry messages from home.”

“Yeah, probably,” he said. “So are you all right?”

“You’re the third person to ask me that today,” Elvi said. “Am I acting like there’s something wrong with me?”

“A little,” Fayez said. “You’ve got a right to being a little freaked out.”

“I’m fine,” Elvi said. Her hand still tingled a little where Holden had held it. She massaged her skin. At the end of the street, a Belter girl was walking fast with her head down and her hands shoved deep in her pockets. Murtry and Chandra Wei stood behind her, watching her suspiciously, their rifles in their hands. The wind coming off the plain lifted swirls of dust in the corners of the alleys. She wanted to go back to her hut, and she didn’t. She wanted to go back up the well, onto the *Edward Israel* and home again, and she wouldn’t have left New Terra for all the money in the world. She remembered being very, very young and terribly upset about something. Crying into her mother’s shoulder that she wanted to go home, except that she was home when she said it. That was what she wanted now.

“Don’t do it,” Fayez said.

“Don’t do what?”

“Fall in love with Holden.”

“I don’t know what you’re talking about,” she snapped.

“In that case, *really* don’t do it,” Fayez said with a cynical laugh, and

turned away.

Chapter Fourteen: Holden

This is the first colonial arbitration meeting,” Holden said, looking into the camera at the end of the table. “My name is James Holden. Representing the colony of New Terra—”

Ilus,” Carol said.

“—is Carol Chiwewe, colony administrator. Representing Royal Charter Energy is chief of security, Adolphus Murtry.”

“How exactly did that happen?” Carol said. She stared at Murtry when she said it, her expression unreadable. Holden had a feeling Carol might be a very good poker player.

Murtry smiled back at her. His face was equally unreadable. “What’s that?”

“You know exactly what I mean,” Carol snapped back. “What are you doing here? You’re hired security. You have no authority to—”

“You put me in this room,” Murtry said, “when you killed the colonial governor. You do remember that? Big explosion? Crashing ship? It would have been hard to miss.”

Holden sighed and leaned back in his uncomfortable chair. He would let the two of them bicker a bit, release some of the venom they’d been storing up, then put his foot down and drag the discussions back on topic.

RCE had offered to host the talks on their shuttle or the *Edward Israel*, which would have been a lot more comfortable. But the colony had demanded that the meeting be held in First Landing. Which meant that instead of contour-fitted gel filled chairs, they were sitting on whatever metal and plastic monstrosities the colony had lying around. The table was a sheet of epoxied carbon weave sitting on four metal legs, and the room

they were using was barely large enough for the table and three chairs. A small shelf on one wall held a coffee pot that was hissing to itself and throwing a bitter scorched smell into the air. Amos leaned against the room's one door, arms crossed, and with an expression so far beyond bored that he might actually have been asleep.

“—endless accusations without evidence to bolster your own *criminal* claims of property rights—” Carol was saying.

“Enough,” Holden cut in. “No more outbursts from either of you. I’m here at the request of the UN and OPA to broker some sort of agreement that can let RCE do the scientific work they’re authorized to do, and to keep the people already living on New Terra—”

“Ilus.”

“—Ilus from being harmed in the process.”

“What about RCE employees?” Murtry asked softly. “Are they allowed to be harmed?”

“No,” Holden said. “No, they are not. And so the mandate of these meetings has changed somewhat in light of recent events.”

“I’ve only seen one person murdered since Holden arrived, and that one is on you,” Carol said to Murtry.

“Madam coordinator,” Holden continued, “there can be no further attacks on the RCE personnel. That’s non-negotiable. We can’t work out any sort of deal here unless everyone knows they’re safe.”

“But he—”

“And you,” Holden continued, pointing at Murtry, “are a murderer, and one I intend to see prosecuted to the fullest extent of the law—”

“You have no—”

“—once we return to a region of space that actually *has* laws,” Holden said. “Which brings us to our first real discussion point. There are two competing claims regarding who has the right to administrate this expedition. We have to establish who makes the laws here.”

Murtry said nothing, but pulled a flexible display out of his coat and unrolled it on the table. It began slowly scrolling through the text of the UN charter giving RCE the scientific mission on New Terra. Carol snorted and pushed it back across the table at him.

“Yes,” Holden said. “RCE has a legal mandate from the UN placing them in control of this planet for the duration of their scientific mission. But

we can't ignore the fact that people had been living on New Terra, or Ilus, for months before that charter was drafted."

"No, we can't," Carol said.

"So we work out a compromise," Holden said, "that allows RCE to do the work they came here to do. Work which will, we hope, benefit everyone, including the colonists. This is a new world. There may be any number of dangers here we are unaware of. But this compromise must also allow for the possibility that the final decision of the home governments will be to grant Ilus self-governing status."

Amos snorted and his head jerked up, eyes wide open for a moment and then slowly narrowing back toward closed.

"Yeah, so," Holden said, "that's the long boring explanation. The short version is, I want RCE to move forward with doing the science, and I want the colonists to continue living their lives, and I don't want anyone getting killed. How do we make that happen?"

Murtry tilted his chair back on two legs and stretched out with his hands behind his head. "Well," he said, "you make a big point of telling me you plan to arrest me once we get back in civilized space."

"Yes."

"But by my count the *colonists*"—he sneered the word—"have racked up about two dozen kills."

"And when we figure out who the perpetrators are," Holden said, "they too will go back to Sol system to face trials."

"You're a detective now?" Murtry snorted. Holden felt a weird chill run down his spine and looked around as if Miller might somehow have appeared.

"I think that the RCE security force, working in conjunction with Mister Burton and myself, should continue its investigation of those crimes."

"Wait," Carol said, leaning forward suddenly in her chair, "I won't let him—"

"Investigation only. No trials can be held here, so no penalties can be meted out beyond protective detention, and that only with my express consent."

"Your express consent?" Murtry said, speaking slowly, like he was tasting the words. He smiled. "If they'll let my team keep looking into the killings while we continue the negotiations here, permit us the right to

protect ourselves, and guarantee that anyone with strong evidence against them will be held against future trial, I'm fine with that."

"Of course he is!" Carol said. "Delay is all he needs to kill us."

Holden frowned at that. "Explain."

"We're not self-supporting yet," Carol said. "We've got the *Barb* up in orbit. She can bring us fuel cells charged from her drive, and she dropped us with all the food and seeds she had, but we can't really plant here yet. Soil has the wrong microorganisms in it. We desperately need food stores, soil enrichments, medical supplies."

"All of which RCE is happy to—" Murtry started.

"But what we do have is the richest lithium vein any of us have ever seen. And with that ore, we can buy everything else we need. The *Israel* is keeping the *Barbapiccola* from sending down her shuttle to pick up the rest, and she's threatened to stop the *Barb* if she tries to leave orbit."

"The mineral rights on New Terra are not yours," Murtry said. "Not until the UN says they are."

Carol slapped the table with her palm; it was as loud as a gunshot in the small room. "See? It's a waiting game. If he can just block us from taking our ore up to the ship long enough, then it won't matter who gets those rights. Even if they're awarded to us, we'll be so behind in moving the ore to the ship that we'll all starve to death before we ever get to market."

"So," Holden said. "You're asking for the right to keep loading the ore onto the *Barbapiccola* while the rights are negotiated."

Carol opened her mouth, closed it, and folded her arms.

"Yes," she said.

"Okay," Holden said with a nod. "Sounds fair to me. No matter who winds up selling that ore, they'll need a transport to move it, and the *Barb* is as good as anything else."

Murtry shrugged. "Fine. We'll allow the shuttle to land and begin transporting ore again. But mining operations come with some problems for me."

"Explain?" Holden said again.

"They're using explosives. The same type of explosive that was used to bring down the shuttle and kill the governor. As long as these people have unrestricted access to it my people are at risk."

"What's your solution?" Holden asked.

“I want to control access.”

“So you’ll let us move the ore you won’t let us mine?” Carol said. “Typical corporate doublespeak.”

“I’m not saying that,” Murtry said, patting the air in a *calm down* gesture that struck Holden as intentionally patronizing. “I’m saying we hold the explosives when not in use, and your mining crews sign them out when needed. That way nothing goes missing and shows up later as a pipe bomb.”

“Carol, does that seem fair to you?” Holden asked.

“It’ll slow the process down, but it’s not a deal breaker,” she replied.

“Okay,” Holden said, standing up. “We’ll stop there for now. We’ll meet again tomorrow to go over the UN proposal on colony administration and start hammering out details. We also need to talk about environmental controls.”

“The OPA—” Carol started.

“Yes, I have the recommendations from Fred Johnson as well, and those will be discussed. I’d like to transmit a revised plan to the UN and OPA by the end of the week, and get their feedback. Acceptable?”

There were nods from both Murtry and Carol. “Great. I’ll want you two with me when I present today’s agreement at the town hall meeting tonight. Our first show of goodwill and solidarity.”

Murtry rose and walked past Carol without looking at her or shaking hands.

Goodwill and solidarity indeed.

“So,” Amos said when Holden exited the town hall meeting that night. “How’d it go?”

“I must have done it right,” Holden replied. “*Everyone’s* pissed.”

They walked along the dusty street together in companionable silence for a while. Amos finally said, “Weird planet. Walking in open air at night with no moon is breaking my head.”

“I hear you. My brain keeps trying to find Orion and the Big Dipper. What’s weirder is that I keep finding them.”

“That ain’t them,” Amos said.

“Oh, I know. But it’s like my eyes are forcing those patterns on stars that

aren't really lined up the right way to make them."

There was another moment of silence, then Amos said, "That's, like, one of them metaphors, right?"

"It is now."

"Buy you a beer?" Amos said when they reached the doors of the commissary.

"Later, maybe. I think I'm going to take a walk. The night air is nice here. Reminds me of Montana."

"Okay, see you when I see you. Try not to get shot or abducted or anything."

"I'll do my best."

Holden walked slowly, the dirt of the planet puffing up around his ankles at every stride. The buildings glowed in the darkness, the only human habitation on the planet. The only civilization in the wilds. He put his back to it and kept on going.

He was far enough outside of town that he could no longer see its dim lights when a faint blue glow appeared beside him. The glow was both there and not there. It lit the air around it while also illuminating nothing.

"Miller," Holden said without looking.

"Hey kid."

"We need to talk," Holden finished for him.

"That's less funny the more you do it," the detective said, his hands in his pockets. "Did you come out here to find me? I admit, I'm a little flattered, considering your other problems."

"Other problems?"

"Yeah, that shantytown full of future corpses you're trying to treat like grown-ups. No way that doesn't end bloody."

Holden turned to look at Miller, frowning. "Is that the former cop talking? Or the creepy protomolecule skin doll."

"I don't know. Both," Miller said. "You want a shadow, you got to have light and something to get in its way."

"Can I borrow the cop for a minute?"

The gray, jowly man hoisted his eyebrows just the way he had in life. "Are you asking me to use your brain to make these monkeys stop killing each other over rare dirt?"

"No," Holden sighed. "Just advice."

“Okay. Sure. Murtry’s a psycho who’s finally in a spot where he can do the creepy shit he’s been dreaming about doing all his life. I’d just have Amos shoot him. Carol and her gang of dirt farmers are only alive because they’re too desperate to realize how stupid they are. They’ll probably die of starvation and bacterial infections in a year. Eighteen months tops. Your pals Avasarala and Johnson have handed you the bloody knife and you think it’s because they trust you.”

“You know what I hate about you?”

“My hat?”

“That too,” Holden said. “But mostly it’s that I hate everything you say, but you’re not always wrong.”

Miller nodded and stared up at the night sky.

“The frontier always outpaces the law,” Holden said.

“True,” Miller agreed. “But this place was already a crime scene when you got here.”

“Bombing the heavy shuttle was—”

“Not that,” Miller said. “I mean all of it. All the places.”

“I seem to spend a lot of time asking people to explain themselves lately.”

Miller laughed. “You think somebody built those towers and structures and then just left? This whole planet is a murder scene. An empty apartment with warm food on the table and all the clothes still in the closets. This is some Croatoan shit.”

“The North American colonists who—”

“Except,” Miller said, ignoring him. “The people who vanished here? Not dumbass Europeans in way over their heads. The things that lived here modified planets like we remodel a kitchen. They had a defense network in orbit that could have vaporized Ceres if it wandered too close.”

“Wait, what defense network?”

Miller ignored him. “An empty apartment, a missing family, that’s creepy. But this is like finding a military base with no one on it. Fighters and tanks idling on the runway with no drivers. This is bad juju. Something *wrong* happened here. What you should do is tell everyone to leave.”

“Yeah,” Holden said, “sure, I’ll get right on that. This argument about who gets to live here really needed a third party both sides could hate.”

“No one lives here,” Miller said, “but we’re sure as shit going to play

with the corpses.”

“What the hell is that supposed to mean?”

Miller tipped his hat back, looking up at the stars.

“I never stopped looking for her. Julie? Even when she was dead, even when I’d seen her body, I never stopped.”

“True. Still creepy, but true.”

“This is like that too. I don’t like it, but unless something happens, we’re going to keep reaching and reaching and reaching until we find what did all this.”

“And then what?”

“And then we’ll have found it,” he said.

A man Holden didn’t recognize was waiting for him at the edge of town. Belter tall, stocky and thick-necked. Big meaty hands he was rubbing together nervously. Holden consciously forced himself not to drop his hand to the butt of his gun.

“Thought you got lost out there,” the man said.

“Nope, all good.” Holden held out his right hand. “Jim Holden. Have we met?”

“Basia. Basia Merton. From Ganymede.”

“Yeah, all of you are from Ganymede, right?”

“Pretty much.”

Holden waited for the man to speak. Basia stared back, wringing his hands again.

“So,” Holden finally said. “Mister Merton. How can I help you?”

“You found my son. Back... back there. You found Katoa,” Basia said.

It took Holden a moment to make the connection. “The little boy on Ganymede. You’re Prax’s friend.”

Basia nodded, his head moving too fast, like a nervous bird. “We’d left. Me and my wife and my two other kids. We got a chance to get out on the *Barbapiccola* and I thought Katoa was dead. He was sick, you know.”

“Same thing Prax’s daughter had. No immune system.”

“Yeah. Only he wasn’t dead when we left. He was still alive in that lab where you found him. I left my son behind.”

“Maybe,” Holden said. “There’s no way to know that.”

“I know that. I know it. But I brought my family here. So I could keep them safe.”

Holden nodded. He didn’t say, *This is an alien world filled with dangers you couldn’t possibly anticipate, on top of which you didn’t actually own it, and you came here to be safe?* It didn’t seem helpful.

“No one can make us leave,” the man finished.

“Well—”

“No one can make us leave,” Basia repeated. “You should remember that.”

Holden nodded again, and after a moment Basia turned and walked away. *If that’s not a member of the resistance, he at least knows who they are*, he thought. Someone to keep an eye on.

His hand terminal chimed an incoming connection request at him.

“Jim?” Naomi said. There was a nervous edge to her voice.

“Here.”

“Something’s happening down there. Massive energy spike in your location, and, uh—”

“Uh?”

“Movement.”

Chapter Fifteen: Havelock

Slowly, New Terra was taking on a sense of familiarity. The planet's one big continent and long strings of islands turned under the *Edward Israel* every ninety-eight minutes, orbital period and the rotation of the planet conspiring to make a slightly different image every time Havelock looked. The features of the planet had started developing names for him, even though they would never be the ones that the official records showed. The largest southern island was Big Manhattan, because the outline reminded him of the North American island. The Dog's Head islands were scattered in the middle of the planet's one enormous ocean, and looked like a collie's face if he squinted. What he thought of as the Worm Fields were actually a massive network of rivers on the big continent, any one of them longer than the Amazon or the Nile. In the north was Crescent City, a massive network of alien ruins that sort of looked like a cartoon moon.

And there, in the flat beige sweep of what he thought of as the Plate, was the black dot of First Landing, like the first lesion of a rash. It was tiny, but when the ship passed over it at night, it was the only spot of light. There were more places and ecosystems down there, more discoveries to make and resources to use, than there had ever been on Earth. It seemed bizarre that they were fighting and dying over that one tiny piece of high desert. And it also seemed inevitable.

Murtry looked out from the display, listening to Havelock's report. Gravity changed the shape of his face, pulling down at his cheeks and eyes. It actually looked pretty good on him. Some people just belonged down a well.

"We had one incident with Pierce and Gillett."

“Those are the two in marine biology?”

“Gillett is. Pierce is actually a soil guy. It didn’t amount to anything more than a little domestic spat, but… well, tempers are fraying. All these folks came out here to work, and instead, they’re stuck here. We’re doing sensor sweeps and dropping the occasional high-atmo probe, but it’s like giving starving people a cracker when they can smell the buffet. It’s starting to come out at the seams a little.”

“That makes sense,” Murtry said.

“Plus which they hate null g. The autodoc’s been pumping out antinausea drugs like there’s no tomorrow. I’m surprised we aren’t just putting that shit in the water at this point.”

Murtry’s smile was perfunctory. Havelock wanted to float the idea of a second colony. Maybe something in the temperate zone near a river and a beach. The kind of place someone might, for example, string up a hammock. It would let the expedition’s crew get working, and the problems with the squatters could work themselves out without putting anyone else in harm’s way. The words hovered at the back of Havelock’s throat, but he didn’t say them out loud. He already knew the arguments against it. You treated a tumor when it was small, before it spread. He could even hear it in his boss’s voice. Havelock cracked his knuckles.

“The shuttle?” Murtry asked.

Havelock looked over his shoulder, even though he knew the office was empty apart from him. When he spoke, his voice was quieter.

“I got some pushback because it meant halving the supply schedule, but people got over it. I thought of having the hold stacked with high-density ceramics for shrapnel, and putting in a few pallets of the geology survey’s shaped charges, but I don’t have anything that’s going to make a bigger explosion than the shuttle’s reactor would. I’ve taken out all the safety overrides the way you asked, though. Physical and software. Honestly, it’s a little scary going on it anymore, just knowing that it *could* go off.”

“And the controls.”

“The standard protocols are all stripped out. You can fly it or I can. Anyone else is talking to a brick.”

“Good man.”

“Captain Marwick’s not happy about it.”

“He’ll cope,” Murtry said. “Better to have it and not need it than need it

and not have it.”

“And we have the ship’s drive,” Havelock said. “If we pointed the *Israel*’s ass at the *Barbapiccola* and fired it up, we could slag it.”

“Right range, we could take out the *Rocinante* too,” Murtry said. “Except that they could say the same, and they’ve got missiles. No, we’re just getting ready for contingencies. Which brings me to the point. I’ve got the solution to one of your problems.”

“Sir?”

“All those bored scientists. We’ve lost a lot of the security team, and we’re in a more hostile environment than we’d expected. I need you to do some cross training.”

“You mean hire them into security?”

“Nothing official,” Murtry said. “But if we had a dozen people who were familiar with the riot gear and had some practice in low g, it wouldn’t hurt my feelings.”

Havelock nodded. “A militia, then.”

“I established that we’re in de facto control of First Landing. Holden thinks he’s some kind of fucking Solomon. I’m fine letting him go with it for now, but when the time comes, we may need to put boots on the ground here. Or on the *Barbapiccola*. I’m happy if we don’t, but I want the option. Can you do that?”

“Let me look into it,” Havelock said. “I’m pretty sure it would mean bending corporate policy. The home office is pretty touchy about liability.”

“They sent us to the ass end of nowhere and let a bunch of squatters take their best shot at us,” Murtry said. “I don’t particularly care what they think. It doesn’t need to be official. Make it a club. Just a few folks enjoying a shared hobby for low-g tactics. Fabricate them a few paint guns. Just make sure they’re ready.”

“In case we need them.”

“Right,” Murtry said with his dragging, full-gravity smile. “In case.”

Technically, Havelock could have spent the time in the main security office, strapped into Murtry’s couch and using his desk. Instead, he tended to stick to his own familiar place beside the brig. He told himself it was because the system was already customized with his preferences and access codes, but he also knew it was more than that. Murtry had a way of claiming space even if he wasn’t occupying it, and Havelock wouldn’t have

been comfortable. So when the second shift ended, the chief of the engineering workgroup came to him at the brig.

Chief Engineer Matthu Koenen was a thick man with short, bottle-brush white hair and a birthmark on his neck that he'd never bothered to have removed. He floated in the air by Havelock's couch, arms folded across his chest and legs crossed at the ankles like a dour, angry ballet dancer.

"Thank you for coming by," Havelock said.

"There trouble?" Koenen snapped.

"No," Havelock said, his voice automatically taking on the gruff tone he used when he was on duty. "I wanted to ask you about putting together a team. A dozen people for small-group tactics exercises."

The chief engineer's brows furrowed and the lines around his mouth deepened. Havelock stared him down. He'd spent too many years as a cop on too many Belter stations to be intimidated by a scowl.

"Small-group tactics?"

"Null-g exercises," Havelock said. "With the riot gear. Just to keep mind and body in condition."

Koenen lifted his chin, his gaze still fixed on Havelock. It was the kind of thing a Belter never did. Havelock didn't know why the gesture so clearly belonged to someone who'd lived planetside, but it did. He found it reassuring. "You're talking about military action? Are we expecting something?"

Havelock shrugged against the couch restraints. The couch shifted a few millimeters on its gimbals. "I want the option," he said, not realizing he was quoting Murtry until he'd already done it.

"Sure, then. I can find another eleven people. When do you want us?"

"How long will it take?"

Koenen tapped his hand terminal with two fingertips. *I can call them right now.* Havelock smiled.

"We'll meet in the shuttle bay at oh seven hundred. I'll go over the equipment. Then an hour drilling every day before shift for the foreseeable future."

"I'll put it on the schedule."

They nodded to each other, and the chief engineer put out his foot, pressing it against the face of one of the cells to launch himself to the ladder. Havelock felt something uneasy shift in his mind. He was forgetting

something. Something important.

When it came to him, he grunted. “Chief!”

The man looked over from the ladder. The plane of his body was orthogonal to the desk, and Havelock’s sense of balance shifted as his brain made one of its occasional panicked flailing attempts to determine up from down. He closed his eyes as a wave of nausea passed over him.

“Yes?”

“When you pick out your team,” Havelock said between clenched teeth. “No Belters.”

For the first time, Koenen smiled. It seemed genuine. “No shit,” he said.

As the acting head of security, he was expected to eat in the officers’ mess. It was one of those small gestures that gave the ship a sense of continuity, of rules and customs being followed. And there were some benefits for him. The lines were shorter, alcohol was available, and the wall screen was usually set to something interesting. Right now, a UN official in an uncomfortable-looking gray suit was folding his hands on a wide, glassy desk. The camera operator was framing it to be seen on hand terminals, and so the man’s face was so large on the wall that Havelock could see his pores and the streaks where the technicians on Earth had dabbed on makeup.

“We are at the beginning of a new golden age,” he said. “The scale of this is immense. Everything we have done, from the first stone tools to the domes on Ganymede, we have done in essence with the resources of one planet. Earth. Yes, the need for minerals and rare earths took us to Mars and Luna. And the Belt. And the need for infrastructure made the Jovian system much more than we had imagined. But we are looking at an expansion that is not one or two but *three* orders of magnitude more than we have had in the history of our species.”

Havelock peeled back the foil from the top of his meal. The beef and peppers had been designed for null g: hard nuggets of protein and vegetable that resisted breaking apart in the air, but turned soft and pleasant in his mouth. It wasn’t as sanitary as tubes of goo, but it was better eating. He popped the first cube into his mouth. It sponged up his saliva, clinging to his tongue. The camera on Earth flickered to a young, serious-faced

woman.

“But the designers of the protomolecule,” she said. “The species who sent it here on Phoebe in the first place?”

“It has been billions of years since that happened,” the man in the suit said. “None of our probes have found any signs of advanced life still functioning. We have seen what appear to be ruins. We have seen what appear to be living biospheres. Honestly, there are mornings it takes my breath away.”

Havelock sipped at the bulb of water, and the food bloomed into a rich mouthful, almost like it had been cooked in a normal kitchen instead of an industrial processor.

“So what’s the catch?” the woman said.

The catch is that the first thing we did once we got here was let a bunch of Belter terrorists claim squatting rights and start shooting at us, Havelock thought as he plucked another cube from the pack. On the screen the UN man unfolded his hands.

“We are processing a bit over four thousand applications *already* for the rights to explore and develop these systems. We have to do this carefully if we are to get things done right. And it does not help that the OPA has used this to make what is essentially a power grab.”

“Bloody Belters,” a voice said. Havelock turned to see Captain Marwick floating in the air behind him. The man’s close-cropped red hair and beard had more gray in them than when they’d left Earth. Havelock nodded.

“D’ye mind if I join you, Mister Havelock?”

“Not at all,” Havelock said, blinking back surprise.

The captain pulled himself to the table and strapped into a crash couch. Behind him, the wall screen shifted from the UN man to the woman interviewing him, but Havelock only registered the change as shifts of lighting and background. His attention was on Marwick.

“How’ve things been going on the surface?” the captain asked, cracking open the box containing his own dinner. He made the words seem like nothing more weighty than polite conversation. Between other people, it probably would have been.

“You’ve seen the reports,” Havelock said.

“Ah, reports, though. Written for posterity and the judge as often as not. Still, I was a bit surprised to see that our mutual friend Mister Murtry had

taken quite such a firm hand just when the mediator arrived.”

“Situation called for it,” Havelock said. “We’ve lost a lot of good people down there by being restrained and patient.”

Marwick made a humming sound that could have meant anything and ate a bite of his meal. His gaze fixed somewhere over Havelock’s left shoulder.

“And of course we’re in a position of relative power here, aren’t we?” Marwick said. “I hope our friend on the ground is keeping in mind that won’t always be the case.”

“I’m not sure I know what you mean.”

“Well, I am not, strictly speaking, a part of the expeditionary force, am I? The *Israel* is my domain. I use my rank as captain to make the demands and requests the home office prefers me to, though in truth I’m just the lorry driver. But I’ll be driving my lorry back through that gate at some point, and Fred Johnson and his well-armed base will be waiting on the other side of it. I’d rather he not think of me first and foremost as a target.”

Havelock chewed slowly, frowning. A dull anger tightened his jaw. “We’re the ones who followed the rules here. We came with science teams and a hard dome. We hired them to build our landing platform, and they killed us. We’re the good guys here.”

“And the moral high ground is a lovely place,” Marwick said, as if he were agreeing. “It won’t stop a missile, though. It won’t alter the trajectory of a gauss round. What our mutual friend does planetside has consequences that go a long way out from here. And there are those among us, myself included, who’d like to go home one day.”

Marwick took another bite of his dinner, smiled ruefully, and nodded as if Havelock had said something. He undid the crash couch straps.

“Keeps body and soul together, these little boxes, but they don’t really satisfy, do they? Give my left nut for a real steak. Well, it was a pleasure, Mister Havelock. As always.”

Havelock nodded, but the anger in his chest rode the ragged edge between annoyance and rage. He knew that it was at least in part because that was the reaction Murtry would have had in his place, but knowing that didn’t change the emotion. His hand terminal chimed. Chief Engineer Koenen had sent a message. He tapped it open.

we've got a full team. one of the boys is fabbing up a little logo for the club. just something to keep morale up.

Havelock considered the image. It was a stylized male form, squat and featureless, holding up a fist larger than its head. It was a cartoon of the Earther body type, and of violence. Havelock looked at it for a long time before he answered back.

looks great. make sure you get one for me.

OceanofPDF.com

Chapter Sixteen: Elvi

What do you mean *movement*?" Elvi asked.

After we saw the power spike," Holden said, "the *Rocinante* did a sweep of the location. Several of them, actually."

He held out his hand terminal, and Elvi took it. She tried to look serious, not to seem impressed. She was a scientist, for God's sake, facing a serious question, not a girl who'd get on her family's shared feed and burble about how James Holden had been in her hut. She flipped the images back and forth. Human brains were wired to see movement, and so the shifting shadows were easy to spot when she went quickly.

"Something's moving," she agreed. "Can we see what it is?"

"Not a lot of imaging satellites up there yet," Holden said. "The *Roci*'s built for ship-to-ship combat more than ground visualization."

Anywhere in the solar system, it wouldn't have been like this. There were so many cameras of such exquisite sensitivity, almost nothing could happen in the vast emptiness inside the orbit of Neptune that couldn't be seen if someone wanted to look for it. It was another reminder of how far from home they were, and how many axioms of daily life didn't apply here.

"What does the *Israel* see?" she asked.

"Nothing that's a lot better," Holden said. "That's why we're going out. It's right at the range of the vehicles. It's going to take the better part of the day to get out there."

"Why?" she asked. "I mean, I see it's decently large, but there are likely to be any number of large organisms in the ocean and colder environments."

"Organisms don't make power spikes," Holden said. "All sorts of things

are moving on this planet. All the time. This just started.”

Elvi touched the image, expanding it until the shadows blurred.

“You’re right. We should check it out,” she said. “Let me get my instruments.”

An hour later, she was in the back of an open loader, Fayeze at her side. Holden sat in front of them, in the passenger’s seat, while Chandra Wei drove. A vicious-looking rifle jounced at Wei’s side, in easy reach if violence came on them unexpectedly. The loader’s engines whined, and the wheels ground against the stones of the wind-paved desert.

“Why didn’t Sudyam come?” Elvi asked, shouting to be heard over the loader and the wind.

Fayeze leaned close to her shoulder. “Wei thought it would be good to have someone on the exobio workgroup still alive if this went poorly.”

Elvi’s felt her eyes go wide, and she glanced at the woman in the driver’s seat. “Really?”

“She phrased it more gently,” Fayeze said.

There was no demarcation of the border, no fence or road to show that they had left First Landing. The stone-and-dirt hills rose and fell, organisms like grass or fungus clinging to the land and being crushed under the loader’s wheels. Slowly, the ruins that had become Elvi’s landmark on New Terra thinned and shrank and fell out of view. She leaned her head against the loader’s roll bar, letting the vibrations of the land translate themselves through her skull. Wei looked over her shoulder, and Elvi smiled at her. The memories of a hundred field excursions in graduate school left her body expecting beer and marijuana, and the anxiety of the actual errand tugged at her. Every day for weeks, she had found some new organism or fact that humanity had never seen before, and now she was going to something possibly even more alien. No one had said the word *protomolecule*, but the implication was thick as cement. Animals didn’t make a power surge. The aliens did.

In the wide, bright sky above them, high-altitude winds pulled a huge green-and-pink cloud into thin streamers. The speculation on Luna was that the strange cloud coloration meant an organism was present in them, something that packed its own minerals up into the sky and used the vapor the way salmon used spawning pools. It was only a hypothesis. The truth could be a thousand times stranger. Or it could be utterly mundane. Elvi

watched the bright fleece of cloud stretch, and the sun track a little too slowly past it. Fayeze was typing furiously on his hand terminal. Wei drove with a focus and intensity that seemed to be her signature ever since she'd come to the surface. Which meant ever since Reeve and the others had gone missing.

Elvi wondered what it meant that she could go out into the absolute unknown, tracking across a planet with no idea what the local dangers might be, and it was thoughts of the people back in First Landing that frightened her. New Terra was supposed to be dangerous and wild and unknown. It was only living up to expectations. The dangers that the people posed were worse because she hadn't seen it coming. And so she was afraid she wouldn't next time either.

She wasn't aware of drifting into a doze until Fayeze put his hand on her shoulder and shook her gently back to herself. He pointed up. A bright spot lit the blue of the sky like Venus seen from Earth. It grew slowly brighter as it tracked west. A thin white contrail formed behind it, the only perfectly straight line in the organically twisting sky. A shuttle. Elvi frowned.

"Were we expecting the shuttle?" she asked.

"That's not ours," Fayeze said. "That's the *Barbapiccola*'s. The mining operation's under way again."

Elvi shook her head. It was all one stupid, shortsighted mistake after another, strung together so that each one seemed inevitable. The colony would sell the ore, get lawyers, make deals. The containment dome would never be set up. What should have been clean, solid biology would turn into a salvage job of *correcting for* this and *discarding the impurities* that. Fayeze seemed to know what she was thinking.

"No research protocol survives contact with the subject population," he said. "That's not just this. It's everything."

The sun had dipped to half a hand above the horizon when the loader topped another rise like a thousand before it. Wei braked and shut off the engines. Fayeze stood up in his seat, his elbows resting on the roll bar. Holden said something obscene under his breath.

"Well," Fayeze said, his voice hushed. "At least it wasn't hard to find."

The thing hunkered down in the depression between two hills. Its vast carapace was the nacreous white that she'd seen in the walls of the ruins, but there was nothing architectural about this. It had an insectile form, long

articulated limbs like legs pressing weakly out into the hardpack. Two larger appendages emerged from its back, one gray and splintered, the exoskeleton empty of anything but dust, the other swinging awkwardly. Five black circles on its abdomen recalled eyes, but didn't shift to focus on them. At least not as far as Elvi could tell.

"What is it?" Wei asked. Elvi noticed that the rifle had made its way to the woman's hands. She hadn't seen that happen.

"I don't know," Elvi said. "I haven't seen anything like it before."

"I have," Holden said. "It's one of their machines. Whatever designed the protomolecule had... things like this on the station between the rings. They were smaller, though. I saw one of them kill someone."

"You're telling me," Wei said, her voice even and calm, "that thing is a couple billion years old?"

"That would be my guess," Holden said.

Fayez whistled low. "That is not dead which can eternal lie. Or, y'know, whatever."

The monster from the desert shifted drunkenly, its legs awkward. Its one functioning arm twisted toward them, then collapsed to the ground. Its body shifted and trembled as it tried to lift it again.

"Look," Elvi said. "Back there."

All along the contour line at the bottom of the valley between hills, the stones had been scraped clean. None of the quasi-fungal grasses remained. No lizards or birds. It was like a vast hand had come down with a sponge and wiped the landscape clean. Now that she knew to look, she saw the thing's legs were pulling the native life up and feeding into tiny, chitinous orifices along its underbelly.

"It's... eating?" she said.

"On the station," Holden said, "soldiers tried to kill one with a grenade. The machines killed the man who threw it and used his body. Reprocessed it right there. Turned him into paste and used him to repair the damage."

"That makes sense," Elvi said. "The protomolecule repurposed biological systems during the Eros event as well."

"Glad you approve, Doctor Okoye," Wei said dryly. "In your scientific opinion, could this pose a threat to the expedition?"

"Sure, maybe," Elvi said, and Holden made a gurgling sound in the back of his throat. The thing lurched forward, lost its footing, and scrambled

back. It was like watching a broken toy or a car-struck dog that hadn't quite died yet. It was fascinating and frightening, and she couldn't look away.

"I think we need to leave now," Holden said, fear making the words come fast. "Like now now. Not later now."

"Isn't what we came here for," Wei said, raising the rifle to her shoulder.

"What are you doing!" Holden shouted. "Did you not hear me about the putty making?"

In reply, Wei opened fire. Tracer rounds drew bright red lines through the air, and small explosions lit every place they struck. The thing staggered back, swinging its arm, but Wei pulled a fresh clip from her pocket when the first one went dry and resumed firing. The thing tried to push in toward Wei, and then to move away from her. A green-gray liquid poured from the wounds in its side. The report of the rifle was deafening.

The thing lurched one last time, and let out a high, teeth-clenching keen. It collapsed, legs splayed, in the pool of liquid. Wei let the gun's barrel drift down until it pointed at the ground. When she looked at Holden, her eyes were hard. Holden hands were on the loader's dash, the knuckles white. His face was gray.

"I hope that's not a problem, sir," Wei said.

"You are out of your fucking mind?" Holden said, his voice high and tight. "That thing could have killed you!"

"Yes, sir," Wei said. "That's why I killed it."

"Did you?" Holden said, his voice continuing to climb. "Are you sure? What if it's not all the way dead? Can we... burn it or something?"

Wei smiled.

"Yes," she said. "Yes, we can."

An hour later, the great ruddy disk of the sun touched the horizon. The flames danced around the thing's corpse, rising up higher than a bonfire. Greasy black smoke spiraled up toward the clouds, and the whole world seemed to reek of accelerants. Wei had taken a small tent from the loader's storage, and Fayez had set it up. Elvi stood, the heat of the sun and the fire pressing against her face. The night was going to be long. They all were, here.

"You all right?" Fayez asked.

"I'm fine. I wish I'd gotten some samples, though."

In the heart of the fire, the thing glowed. Its shell was white-hot, and

thin cracks had started to show, radiating out from its joints. It was beautiful in its way, and she was sorry to see it destroyed and relieved in almost equal measures. It wasn't an emotional mixture she was used to.

Wei insisted on setting up watches through the night, and Holden volunteered to take the first of them. He seemed uneasy in a way that Elvi wouldn't have thought James Holden, captain of the *Rocinante*, was capable of. Vulnerable. Elvi lay in the tent, her head poking out. Fayez snored softly beside her. Wei, curled in the back of the loader with a thin blanket, was silent as stone. Elvi watched Holden and listened while he hummed to himself, a lonely human sound in the vast inhuman planet. Sleep didn't come. After two hours, she gave up, rose from her uncomfortable bed, and went to sit at the man's side. In a world without moonlight, there was only the orange glow of the alien's dying pyre and a thin silver highlight of stars. It reduced him to a few lines and a sense of mass and warmth.

"I couldn't sleep," she said.

"I don't think I will either," he said. "I hate the way those things scare me."

"I'm surprised to hear you say that."

"You were expecting me to enjoy it?" She could hear the smile. Far above them, a falling star streaked across the sky, bright, and then gone.

"I'm not used to hearing men admit to having emotions," she said. "You were on Eros when the outbreak came, weren't you? I'd think after that, nothing would frighten you."

"Doesn't work that way. After Eros, everything frightened me. I'm still trying to calm down." He chuckled. When he spoke again, his voice had sobered. "Do you think that thing was a machine? Or was that an animal?"

"I don't think that's a distinction they would have made."

"You mean the designers? Who the hell knows how they would have seen anything?"

"Oh, we can say some things," Elvi said. "What they cared about was in what they designed. And still is, in a way. We know that they respected the power of self-replicators and knew how to harness it."

She felt him turn toward her more than saw it. She was profoundly aware of being a woman in a dark wilderness with a man beside her. It made the vast night seem intimate.

"How do we know that?" he asked.

“Where they sent the protomolecule,” she said. “The universe has some things that are fairly consistent. The elements are the same. Carbon is always carbon. Nitrogen’s always nitrogen. They make the same bonds and can build the same structures. All the systems we’ve surveyed have at least one planet that has the possibility of generating organic replicators.”

“Meaning things with DNA?”

“Or things that act like DNA. They sent out bridge builders to use those basic biological replicators, whatever their form. They can take a biosphere and turn it into a massively networked factory. It’s probably how they spread. Target the places that can be hijacked into making the things that let you get there. Also, they really built structures to last. They seem to have taken the long view on galactic colonizing.”

She leaned back, letting her hand rest on the front of the loader. Not reaching out to him, but putting her fingers where, in the darkness, he might accidentally brush against them. To the north, some small animal called, its voice high and chirping.

“It was there for billions of years,” Holden said. “And we killed it with a rifle and some mineral spirits.”

“In our defense, it wasn’t looking healthy. But yes. It wasn’t expecting anything as advanced or aggressive as we are. They built structures that lasted billions of years. The ruins. That thing. The rings. All of it.”

“They sound like gods sometimes. Angry spiteful gods, but still.”

“No,” Elvi said. “Just organisms that we don’t understand. And with their own constraints. They were specialized for their ecosystem, just like we are. Thirteen hundred worlds seems a lot when you’ve only ever had the one, but it’s a raindrop in the ocean compared with what’s out there, just in our galaxy.”

“They had more.”

Elvi made a small inquiring sound.

“They had more,” Holden said. “But something attacked them, and they tried to stop it. They burned up entire solar systems. A lot of them. Then, when that didn’t work, they shut down the whole network. Quarantined themselves and died anyway.”

“I didn’t know that.”

“I saw it. Sort of. A guy I used to know is kind of looking into it.”

“I’d like to talk to him,” she said.

“Yeah, he’s less helpful than you’d expect.”

Wei shifted in her sleep. Elvi yawned, though she wasn’t particularly tired.

“Why did it wake up?” he said, nodding toward the alien corpse. “Was it because of us? Did it know we were here?”

“Maybe,” she said. “Or maybe they cycle up and down every so often. We’ve only seen one. There may be a lot of these and seeing them will be common. There may be a few and it will be rare. There could only have been one. Not enough data yet.”

“I guess not. Still, I wish I knew what was going to happen.”

“I don’t. So much of my life has been better than what I imagined, I’ve come to enjoy being surprised. When I was doing my undergraduate at Kano, I was imagining I’d be doing environmental assays on Europa for my whole career. Instead, this.”

“Kano?”

“I spent a lot of time in the West African Shared Interest Zone when I was growing up. Northern Nigeria. I went back there for university.”

“Really?” Holden said, his voice bright. “One of my fathers had family in Nigeria.”

“One of them?”

“I have several,” he said. “Extended parental group.”

“Oh. I’ve heard of those.”

“Makes for a big nuclear family, and a *huge* extended one. We might be cousins.”

“I hope not,” Elvi said, laughing, and then wished she could suck the words back. The silence was terrible. She couldn’t see his face clearly, but she could imagine it. The surprise. The embarrassment. She pulled her hand back and put it in her lap.

“I—” he said.

“If you’d like, I’ll take the rest of the watch,” Elvi said. The lightness in her voice sounded forced, even to herself. “I don’t think I’ll be sleeping much tonight anyway.”

“That would be... great,” Holden said. “Thank you.”

“Just be careful of Favez. He steals the blankets.”

James Holden slid off the loader. She heard his footsteps tracking back to the tent, heard the rustle of the plastic as he bedded down. She hunched

over, arms around her belly. The thing from the desert was nothing more than embers, glowing dull orange in the night but illuminating nothing. The humiliation sat with her, bright and painful as a paper cut.

“Stupid,” she said softly. “Stupid, stupid, *stupid*.”

The alien darkness didn’t disagree.

Chapter Seventeen: Basia

Coop and Cate had been old-school OPA, back when the Outer Planets Alliance was just a shared opinion with guns. They'd come up the ranks together when even wearing the OPA's split circle on your sleeve was an arrestable offense. They'd learned their craft sneaking past armed Earth-Mars Coalition checkpoints, planting bombs, smuggling guns, and generally acting like the terrorists the inner planets had accused them of being. The only reason they hadn't both gone to prison camps forever was because by some standards, the OPA had won. After Eros, the inner planets had begun treating the OPA like an actual government, and many of the OPA warriors had received the de facto amnesty that non-enforcement brought.

Cate was just a miner now, like the rest of them, but she could use words like *tactical advantage* and actually sound like she knew what she was talking about.

"The terrain and numerical superiority are our tactical advantages," Cate said to the small group assembled in her house. "But we're outgunned. No way around that. We have maybe a dozen firearms total. We can still get explosives, but the deal Holden struck with RCE makes it much riskier."

"Fucking Holden," Zadie said.

"We'll deal with him soon enough," Cate replied.

Her audience was made up of the usual gang. Zadie's son had taken a turn for the worse with his eye infection, and her wife was staying home with him full-time now. Basia had the impression that Zadie was looking for someone to punish for her family's pain. Pete, Scotty, and Ibrahim were there as well, the veterans of their one skirmish with the RCE security people. It gave them a degree of status in the group that they'd latched on

to. But there were a few new people as well. Other members of the colony who might have been on the fence before about the best way to deal with RCE, but had been pushed into the revolutionary camp by Murtry's brutal tactics. By the martyring of Coop.

"How?" Scotty asked. "How do we deal with Holden?"

"I think we remove all of our problems in one multi-front operation," Cate said. "Murtry and his team, Holden and his thug, everyone at once. The key to this kind of war is money."

"Make us too expensive to occupy." Ibrahim nodded. He'd been OPA too.

"Exactly. That's how we got the inners off our asses in the Belt. If it's not economically viable to occupy us, they won't. Every one of them that goes home in a body bag is one more nail in the corporate coffin." Cate punched one large fist into her other hand to punctuate.

"I don't follow. How does killing them help us with that?" Basia asked. He'd agreed to come in the hope he might be able to help cooler heads prevail. That was looking less and less likely the longer the meeting went on.

"It's an eighteen-month trip to send new troops to the front," Cate answered. "That's a long-flight freighter tied up for over three years. That's expensive. And for the year and a half they're flying out here, we're fortifying our position. Making camps in the hills. Branching out. In order to win, they'll need to do a full military program. Medina Station won't support that, even if they get pissed at us for pushing the issue."

"Coercive alliance," Ibrahim added, nodding.

"By the book," Cate said.

The room was quiet for a moment as everyone there mulled over her words. The metal roof rattled and scraped as the wind outside blew sand across it. The windows creaked, cooling with the night. A dozen people breathed the alien air.

"They're here already," Basia said, clearing his throat to break the silence. "Isn't that exactly what they'll do?"

"What who will do?" Scotty asked.

"The *Rocinante*," Basia replied. "They're in orbit right now. A warship, with guns and missiles and who knows what else. If we kill Holden, can't they just bomb us?"

“Let’s hope they do!” Cate thundered at him. “By God let’s hope so. A few videos of dead colonists, murdered by UN ships in orbit, and the public opinion war is over.”

Basia nodded as though he were agreeing, while what he was really thinking was, *I’m on the wrong team.*

“So, we move on both groups at once,” Cate said. Her voice had taken on the same cadences Coop used to have. It was as if the man were still in the room, haunting the place. “They keep two people on roving patrol at all times, so we’ll need a team shadowing them until the signal goes out. We’ll put a second team on the security building where Murtry and the rest of his people will be. The third team will go to the commissary where Holden and his crewman are holed up at night. I’m thinking Scotty and Ibrahim for team one. I’ll lead...”

Cate rattled on, laying out the insanity of multiple murder like a puzzle to be solved or a game to be won. Coordinating the attacks so all three happened at once, so no one could raise the alarm. Using phrases like *fields of fire* and *maximum aggression* as if they meant anything other than gunning down a dozen women and men while most of them slept. The little group nodded and followed along. Basia was astonished by how easily the unthinkable became the routine.

“My children live here,” Basia said, interrupting.

“What?” Cate said, looking genuinely puzzled. She’d been mid-sentence when he spoke up. “I don’t—”

“The bodies that we take pictures of to send to the newscasts,” Basia continued. “Those are our children. My children.”

Cate blinked at him, too puzzled to be angry yet.

“Como?”

“I wanted to come here and maybe talk you out of doing something stupid,” Basia said, standing up and addressing the room. “I thought maybe with Coop gone, we could put an end to this. But this isn’t just stupid anymore. Not when you can talk about dead friends and family as media tools. That’s evil. And I can’t be part of it.”

The room was silent again, except for the sand and the cooling windows and the breathing.

“If you try to get in our way—” Ibrahim started, but Basia wheeled to face the man.

“What?” he said, getting close enough that his breath stirred the whiskers in Ibrahim’s thin beard. “If I get in your way what? Don’t make half a threat, macho.”

Ibrahim was smaller than him. He lowered his eyes and said nothing. Basia felt a brief moment of shameful relief that it was Ibrahim who had chosen to press the issue, not Cate. Basia was afraid of Cate. He’d never have been able to stand up to her.

“Dui,” he said, backing away and nodding to them all. “Gone now.”

They began talking in hushed tones after the door closed behind him, but he couldn’t hear what they were saying. It made the back of his neck itch. He wondered if he’d gone too far, and if they’d be content with just killing him and not Lucia too.

Halfway home he ran into two of the RCE security people walking patrol. Two women in heavy body armor that made them look bulky and dangerous. One of them, a fair-skinned woman with raven-black hair, nodded at him as he walked past. Everything about her was a threat: the armor, the large assault rifle she cradled in her arms, the stun grenades and wrist restraints hanging on her belt. Her friendly smile looked wildly out of place. Basia couldn’t stop himself from picturing her bleeding out in the street, shot in the back by one of his friends.

Lucia was waiting on their porch, sitting cross-legged on a large pillow and drinking something that steamed in the night air. Not tea. They had almost none of it left. Probably just hot water with a bit of lemon flavoring. But even the artificial flavorings would soon be gone unless they were given permission to begin trading their ore.

Basia sat down on the hard carbon fiber floor next to her with a thump.

“So?” Lucia asked.

“They won’t listen.” Basia sighed. “They’re talking about killing the RCE people. All of them. And Jim Holden and his people too.”

Lucia shook her head, a gentle negation. “And you?”

“At this point, they may be talking about killing me too. I don’t think they will as long as I don’t get in their way. But I can’t take part. I told them so. I’m so sorry I let it get this far, Lucy. I’m a very stupid man.”

Lucia gave him a sad smile, and put her hand on his arm. “Not doing anything now keeps you on their side.”

Basia frowned. The night air still held the earthy smell of the recent dust

storm. A graveyard scent. "I can't stop them by myself."

"Holden is here to do that. He's back from whatever he was doing out in the desert with the science teams. You could talk to him."

"I know," Basia said, admitting what he'd already been thinking. The fact that it was necessary didn't make it feel like any less of a betrayal of his friends. "I know. I will."

Lucia laughed her relief. At Basia's puzzled look, she grabbed him in her arms and pulled him close. "I'm so happy to know that the Basia I love is still in there."

Basia relaxed into her embrace, letting himself feel safe and loved for a moment.

"Baz," Lucia whispered in his ear.

Don't say anything that will ruin this moment, he thought.

"Felcia is leaving on the shuttle for the *Barbapiccola*. Now. Tonight. I gave her permission."

Basia pulled himself away, holding Lucia at arm's length. "She's doing what?"

Lucia frowned at him, and gripped his upper arms tightly. "Let her go." There was a warning in her voice.

Basia pulled himself free and leaped to his feet. Lucia called after him, but he was already running down the road toward the landing site as fast as his legs would carry him.

His relief when he saw the shuttle still sitting there was so powerful he almost collapsed. One of the colony's electric carts whizzed by, nearly running him over in the dark. The bed of the cart was filled with ore. They were still loading the shuttle. He had time.

Felcia stood a few meters from the airlock, a suitcase in each hand, chatting with the pilot. They were in a bright pool of illumination cast by the work lights surrounding the ship, and her dark olive skin seemed to glow. Her black hair hung about her face and down her back in loose waves. Her eyes and mouth were wide as she spoke on some topic that excited her.

In that moment, his daughter was so beautiful it made Basia's chest ache. When she spotted him, her face lit up with a smile. Before she could speak, Basia wrapped her in his arms and squeezed her tight.

"Papa," she said, worry in her voice.

"No, baby, it's okay," he shook his head against her cheek. "I didn't

come to stop you. I only... I couldn't let you leave without saying goodbye."

His cheek felt wet. Felcia was crying. He held her by the shoulders and pushed her away to look at her face. His little girl, all grown up but crying in his arms. He couldn't help but see the four-year-old she'd once been, weeping when she fell and hurt her knee.

"Papa," she said, her voice thick. "I was worried you would hate me for going. But Mama said—"

"No, baby, no." Basia hugged her again. "You go, and when they let the ship leave, you go to Ceres and become a doctor and have a fantastic life."

"Why?"

Because the people here see your death as a tool for winning a public opinion battle. Because I've lost all the children I ever plan to lose. Because I can't have you see me when they finally arrest me.

"Because I love you, baby," he said instead. "And I want you to go be amazing."

She hugged him, and for that one moment, all was right in the universe again. Basia watched as she boarded, stopping just inside the airlock to wave and blow him a kiss. He watched as they loaded the last of the ore into the cargo compartment. He watched as the shuttle lifted off with a roar and wash of heat.

Then he turned back toward town to find Holden.

Holden and Amos were sitting in the commissary's tiny bar. Amos drank and watched everyone who came in through the door. He held his glass with his left hand, his right never far from the gun at his belt. Holden was typing rapidly on a hand terminal lying on the table. Both men looked tense.

Basia walked toward them, smiling and nodding his head and keeping his hands visible and away from his body. Amos smiled back. The big man's scalp looked pale and shiny under the commissary's white LEDs. When he leaned forward in his chair it looked perfectly natural and non-threatening, and Basia noted that it also put the gun closer to hand seemingly by accident.

They were not the sort of details he would have noticed before. Coop

and Cate and the violence of the last few months had left him on edge, seeing the potential for violence everywhere. When he looked at Amos, he suspected his instincts were not wrong.

Raising his hands, he said, "Captain Holden, can I join you for a moment?"

Holden's head darted up, startled and frightened. Basia was pretty sure he was not the source of the man's fear, and wondered what was. Murtry and his corporate killers? Had Holden heard from someone else about the planned attack?

"Please," Holden said, the fear disappearing from his face as quickly as it had come. He gestured at one of their table's empty chairs. "What can I do for you?"

Amos said nothing, just kept smiling his vague smile. Basia sat, making sure to keep his hands on the table and in plain view. "Captain, I've come to warn you."

"About?" Amos said at once. Holden said nothing.

"There is a group here. The same group that attacked and killed the RCE security team prior to your arrival. They plan to kill the remaining security people sometime in the next few days. Maybe as early as tomorrow night."

Holden and Amos shared a quick look. "We've been expecting something like that," Holden said. "But that's not the important—"

Basia didn't let him finish. "They also plan to kill you."

Holden sat up a little straighter. He didn't seem angry so much as offended.

"Me? Why would they want to kill *me*?"

"They think it will send a message," Basia said, his tone apologetic. "Also, they're mad about the explosives inspectors."

"Told you," Holden said to Amos. "A good compromise pisses everyone off."

Without realizing he was going to do it, Basia grabbed the bottle off the table and took a long drink. It must have been something they had brought with them, because it was much better whiskey than anything the colony had access to. It warmed his throat and belly pleasantly, but didn't calm him as much as he'd hoped. He pushed the bottle back toward Amos, but the big man stopped him. "You keep that, brother. You look like you need it."

"What are you going to do?" Basia asked Holden.

“About the assassination? Nothing. It won’t matter because we’re all leaving.”

“We’re all—?”

“We’re evacuating the planet. All of us. Everyone.”

“No,” Basia said. “No one’s leaving. We can’t go now.” *I helped kill people to stay here.*

“Oh, we *really* are,” Holden said. “Something very bad is happening on this planet, and it has nothing to do with obstinate Belters or sociopathic corporate security.”

Basia took another long drink from the bottle. The alcohol was starting to leave him a little fuzzy, but not any less anxious. “I don’t understand.”

“Somebody used to live here,” Holden said, waving one arm around. It took Basia’s drink-addled mind a moment to realize Holden didn’t mean the commissary. “Maybe they’re gone, and maybe they aren’t, but they left a lot of stuff behind and some of it’s waking up. So before we wind up being Eros with a great big sky, everyone is getting the hell out of Dodge.”

Basia nodded without understanding. Amos grinned at him and said, “The towers and robots, man. He means the alien shit. Looks like some of it’s waking up.”

“I’m sending a message up to the *Roci* right now to bounce it on to the UN and the OPA council,” Holden continued. “My recommendation is that everyone get into orbit as soon as possible. I’m asking for emergency command of the *Israel* and the *Barbapiccola* to facilitate that.”

“That isn’t going to happen,” Basia said, his voice soft.

“It’s not an easy sell,” Holden said, “but I can be persuasive. And once I have command—”

“They won’t go,” Basia said. “People already bled for this land. Died for it. We’re willing to kill each other to stay here, we’ll sure as hell stay and fight whatever else wants us gone.”

“Providing there’s anyone left,” Amos said.

“Well, sure,” Basia agreed. “Providing that.”

Chapter Eighteen: Holden

Murtry and his security team had converted the small prefab security outpost into a fortress. The inner walls had been sprayed with energy-absorbing foam that looked like whipped cream but formed a ballistic barrier that could stop small-arms fire and light explosives. A large gun cage sat against one wall, secured with a biometric lock. It had only a few guns in it. Since Holden didn't know exactly how many the security team had brought with them, that was either a good thing or a bad thing.

Murtry sat behind a small desk with a hand terminal lying on it. He leaned back in his chair, hands behind his head, a vague smile on his face. He looked like a man with all the time in the world.

"Did you hear me when I said that people are planning to murder your team?" Holden asked.

"I wish you'd stop using that word," Carol Chiwewe said. She insisted on being present at any meeting between Holden and the RCE people, and it had seemed like a reasonable request. Now, with her own people plotting an attack, it felt like a security risk.

"'Murder'?" Murtry said. "'Terrorism' has a nice ring to it. 'Homicide' always sounded a bit legalistic to me. Pretentious."

"Wait," Holden cut in before Carol could respond to Murtry's baiting. "Cut that out right now. My capacity for giving a shit about your little tiff down here has hit its limit. This is no longer a negotiation of rights or a discussion of who attacked who first."

"No?" Murtry said. "And what is it, then?"

"It's about me telling you what's going to happen."

"Telling," Murtry said.

“You’re not in charge here,” Carol added. Holden squashed the irritation he felt at their only taking sides to make his life harder.

“Two things have changed recently, and one hasn’t,” he said, working to keep his tone pleasant. “The violence is about to escalate, with us teetering on the edge of an all-out shooting war between the colony and RCE. And, probably more importantly, the alien stuff left on this planet is waking up.”

“What’s the one that didn’t?” Murtry asked.

“What?”

“The one thing that didn’t change.”

“Right,” Holden said, leaning across the desk toward him. “I’m still the only guy in the system with a warship in orbit. So with those three things in mind, we’re leaving this planet before you idiots can kill any more of each other, or before the aliens kill all of us.”

“Threats now?” Carol said behind him.

Without looking away from Murtry, Holden said, “You bet, if that’s what it takes. Start getting your people ready for evac. Get the *Israel*’s shuttles down here. Do it now. The *Israel* is leaving with me in thirty hours, and you’ll want to be on it when we go.”

“You can’t,” Carol said, and Holden spun around to face her.

“I can. We’ll get the *Barb*’s shuttle back down here, and I suggest you have your people pack up everything they care about and start getting on it. Because the *Barb* is leaving.”

Carol’s mouth went tight and her hands curled into fists.

“You done?” Murtry asked, his voice light. “May I present my rebuttal?”

“There isn’t one,” Holden said, pulling a chair up to the desk and sitting down. Showing he didn’t care about the trappings of control the security office gave Murtry.

“So, here’s the price of fame,” Murtry continued. “You are one of the most recognized people in the solar system. It’s why they sent you. Fame gives you the illusion of power. But it’s all just a façade.”

“No, the fact that I own the *Rocinante*—”

Murtry patted the air again in the same condescending gesture he’d used on Carol. “You’re famous for being the man who tries to save everyone. For being the solar system’s white knight. Tilting at giants like Protogen and Mao-Kwik. Your ship’s got the right name.”

Murtry laughed at Holden’s frown.

“Yeah, I’ve read a book,” Murtry went on. “So that’s why they send you here. No one will expect the great James Holden to take sides. Of secretly backing either the colonists *or* one of those nasty Earth corporations. You’re the man without an agenda or subtext.”

“Great,” Holden said. “Thanks for the insight. Now call your people and —”

“But we’re eighteen months from the closest legal remedy, and the only real power you have out here is violence.”

“You’re the violent man here,” Carol said, making it an accusation.

“I am,” Murtry agreed. “I understand its uses better than most. And the thing I know about you, Captain Holden, is that you are not. Now, if that brute you brought with you were in here making these threats, well, I’d have to take that seriously. But not from you. You’ve got a warship in orbit right now that could blow the *Israel* and the *Barbapiccola* into glowing slag, then rain down destruction on this planet that would wipe out every shred of human life in this solar system. *But* you’re not the man to pull that trigger, and we both know it. So save your threats. They’re embarrassing.”

“You’re out of control,” Holden replied. “You’re insane, and as soon as RCE finds out—”

“Finds out what? That the UN mediator got spooked because there was an alien artifact on an alien planet, and I didn’t?” Murtry interrupted. “Send in a full report. I’m sure that with your reputation and the backing of the UN and OPA, your words will be given serious consideration. And maybe, *maybe* three years from now a replacement will arrive to relieve me of duty.”

Holden stood up, dropping his hand to the butt of his gun. “Or maybe I relieve you right now.”

The room went silent for a moment. Carol seemed to be holding her breath. Murtry frowned up at Holden, seemingly taken off guard for the first time. Holden waited, not breaking eye contact, angry enough to draw on Murtry and furious with himself for letting it get to that point.

Murtry smiled. It did nothing to break the tension. “If you’d brought the other one with you, that threat might have some weight. We both know who the killer on your crew is.”

“If you think I wouldn’t blow you out of that chair right this second to save everyone else on this planet, then you don’t know me at all.”

There were scratching sounds on the floor as Carol shuffled back toward the door and out of the potential firing line. Holden kept his eyes on Murtry. The man frowned up at him for several seconds, then shifted back to the vague smile. *Here we go*, Holden thought, and tried not to let the rush of adrenaline make his hand shake.

When the hand terminal on the desk squawked a connection request, Holden was so startled that he half drew his gun before he could stop himself. Murtry didn't move. The terminal screeched again.

"May I answer that?" Murtry asked.

Holden just nodded at him, dropping his gun back into its holster. Murtry picked up the terminal and opened the connection.

"Wei here," a voice said.

"Go ahead."

"Team in position. Birds are all in the nest and tooling up. Are we a go?"

"Hold," Murtry said, then put the terminal down and looked back up and Holden. "You're still twitching over what happened on Eros. I get that. You're not rational about all this alien shit, and honestly, who would be? I forgive you for the threats. And I appreciate that your initial purpose in coming here was to warn me about the danger to my team. It says something to me that in spite of our differences, you're still trying to save my people."

"No one needs to die here," Holden said, hoping against hope that Murtry was backing down.

"Well, that's not strictly speaking true," Murtry replied. "I'm good at this job. Did you think I didn't know about this little uprising? I knew before you did."

The security teams constantly patrolling the town would never have gotten close enough to listen in. "You've been bugging the town."

"Every building in it," Murtry agreed. "So while I appreciate you coming here, I think I've got the situation handled."

"You bugged my town?" Carol asked, anger seeming to win out over her fear.

"What are you doing?" Holden said. "Don't do something stupid."

Murtry just smiled again, picked up his hand terminal, and said, "Strike team is go."

The gunshots outside were softened by the foam covering the walls, and

sounded like a rapid string of faint pops. Like distant fireworks, or a bad hydraulic seal finally letting go.

“Oh no,” Carol said, and rushed to the door. Holden followed her, fumbling with his hand terminal to call Amos.

Outside, the sound was much louder. The staccato reports of gunfire splitting the peaceful night air, the flashes a distant strobe lighting up the far edge of the town. Holden ran toward the shots, shouting into his terminal for Amos to come. He stumbled in the dark, dropping it, but didn’t stop to pick it up.

At the northern edge of town, he found the rest of Murtry’s security team firing on one of the houses. Shots were coming back at them from inside. The security people were shouting at the people in the house to surrender, the people inside cursing and firing in answer. Smoke poured out one of the house’s broken windows, something inside burning.

“Stop it!” Holden yelled as he ran toward the RCE people. They ignored him and continued to pour fire into the house. Answering bullets hit one of the RCE people in the chest, the body armor making a dull thud as it stopped the round. The security woman fell on her back, yelling in pain and surprise. The rest of the team opened up on the window the shot had come from, blasting the frame and inside wall behind it into splinters.

The blaze inside the house spread suddenly with a wave of heat and a whooshing sound. Someone inside screamed in panic or pain. The front door, already just a mass of carbon fiber splinters from gunfire, swung open. A woman rushed out, a rifle in her hands. The security team shot her into a splatter of blood, and she collapsed at the bottom of the steps, twitching.

“They’re burning!” Holden yelled, grabbing the nearest RCE person by the arms and shaking him. “We have to get them out!”

The man responded by shoving him away. “Stay back until the area is cleared, sir!”

Holden shoved back, hard enough to put the RCE man on his ass in the dirt, and ran toward the fallen woman at the front of the house. Someone inside must have thought he was attacking, because a shotgun blast rang out and the ground a meter behind him flew up in a miniature explosion of dust. The RCE people opened up, and Holden found himself between two different firing lines.

Again, some distant and still calm part of his brain thought, marveling at how often this sort of thing seemed to happen.

He dove to the ground and rolled his body on top of the fallen woman, screaming for everyone to stop. No one listened. The fire in the house billowed out with another loud whump, and the heat scorched the exposed skin on Holden's face and hands. The gunshots from inside the house cut off all at once, and the RCE return fire soon after. Holden grabbed the fallen woman by the arms and dragged her away from the flames. He stumbled when he reached the RCE people, falling down at their feet.

"Help *her*," he croaked at the woman who reached down to help him up. He pushed himself up to his hands and knees, but stopped there, too dizzy to stand.

Another member of the security team was already bending over her. "This one's dead."

Holden collapsed back to the ground, suddenly robbed of strength. Too late. The big meat grinder he was trying to save these people from just kept chewing away relentlessly, and they kept lining up to throw themselves inside. The RCE people were helping up their fallen comrade, and she was insisting that she was fine, that the armor had stopped the round, that she'd just have a big bruise. Someone joked about idiots bringing slingshots to a gunfight, followed by laughter. All the while, the house burned, filling the air with acrid black smoke and the smell of hot epoxy and cooking pork.

The RCE people seemed to remember he was there, and several came over to look down at him. "Secure him," one said. Wei. The one who'd come out to look at the alien robot with them. The one who'd shot it. She stared down, nothing like compassion in her eyes.

"Fuck you," Holden said, trying to push himself back up to his feet. "You aren't securing shit."

Wei smashed him in the chest with her rifle butt, knocking him back to the ground. One of the other security people pointed his rifle at Holden. He found himself thinking it was very likely he was about to be shot.

"Hold on, now," a calm voice said. Murtry strode into view out of the darkness. "No one's shooting Captain Holden."

"He tried to help the terrorists," Wei said.

"Did he?" Murtry feigned shock. "You didn't, did you? That would be a violation of the neutrality of your position here, wouldn't it?"

"I tried to help a woman who'd been shot," Holden replied, slowly climbing to his feet. His sternum felt bruised. That was all right. It would only hurt when he breathed.

"That sounds reasonable," Murtry said. "Is that the extent of his aid to the terrorists?"

Wei nodded, then looked away, annoyed.

"Then there's no reason to detain you," Murtry continued, his voice full of good cheer. *He's insane*, Holden thought. *He's gone completely over the edge. I could kill him right now and end this.* In his mind, he could picture Miller nodding in approval at the thought.

"Sir," Wei said, bringing her rifle up to her shoulder and aiming into the darkness beyond the firelight. "Incoming."

"Hold your panties," Amos said from the dark and stepped into the light. He had Basia Merton and Carol Chiwewe and a number of other colonists with him.

"My God," Carol said, looking at the fire. "Did anyone get out?"

One of the security people pointed his rifle at the body lying on the ground. "She did."

"Zadie," Basia said. "They killed her."

Murtry stepped forward and cleared his throat. When everyone was looking at him, he said, "My team surrounded the house where a cell of known terrorists were actively preparing to murder myself, the entire RCE security detachment, and Captain Holden. They had firearms and possibly explosives. When the RCE security team demanded that they exit the building unarmed and with their hands up, they opened fire. All of the terrorists were killed by the *return* fire. It's possible that explosives the terrorists were planning to use acted as an accelerant when the house started burning. Everything done here was by the book and appropriate for protecting RCE personnel and the UN/OPA mediator from harm."

Carol looked at blazing house with a stunned expression. "Appropriate..."

"Mister Merton," Murtry continued. "So glad you could join us. Sergeant Wei, take Basia Merton into custody."

"What?" Basia said, raising his hands and backing up. "Why me?"

"No," Holden said, stepping in front of Wei and planting his hand on the breastplate of her armor. "Not happening."

“Mister Merton was a party to this conspiracy,” Murtry said, speaking loud enough for the gathering crowd of colonists to hear. “He attended the secret meeting at which the attack was planned, and there is significant evidence that he was a participant in the attack which killed five of my people. Might have something to say about what happened to Governor Trying too.” Lowering his voice, he said, “Out of the way, Holden, or we’ll just go through you.” Wei smiled at him without humor. One of the other RCE people walked around them toward Basia, a plastic wrist restraint in his hands.

Amos stepped in front of Basia and punched the RCE man in the face. It sounded like a hammer hitting a side of beef. The security man fell to the ground, a puppet whose strings had been cut.

“Nope,” Amos said, then shook his right hand with a grimace and added, “Ouch.”

The rest of the security team brought their rifles to bear on him. Holden saw Amos drop his right hand toward his gun, then stepped in front of him and yelled, “Stop!”

“We’re taking him in,” Murtry said, pointing at Basia. “One way or the other. We’ll let the assault on one of my people slide for now. Emotions running hot, and all.”

“We’re all leaving anyway,” Holden said, keeping his voice low, appealing to Murtry rather than the crowd.

“You have no authority to order anyone to leave,” Murtry replied. “I hoped we were done with that.”

“In the meantime,” Holden continued as though Murtry hadn’t spoken, “the UN is taking custody of this man. Basia. As part of our investigation. He’ll be secure on my ship, he won’t be a threat to your people down here, and when we all get back you can present your evidence and have him arrested.”

“ ‘Get back,’ ” Murtry said with a lazy smile. “Just going to keep him in a holding cell for the next few years? Because I accused him of something?”

“If I have to,” Holden said. “Because I don’t believe for a second that you wouldn’t kill him.”

Murtry shrugged. “Okay. He’s your baggage, then. Just keep him off my planet.”

Basia looked stunned, his eyes focused on nothing in particular. The colonists began organizing a firefighting detail to put the blaze out. Murtry and his team stood and watched, not offering to help, a visible reminder of the threat they presented next to the violence of their handiwork.

Holden headed back into town, Basia and Amos in tow. He patted his pockets looking for his hand terminal before remembering he'd dropped it on the run out to the fight. He'd never find it in the dark, so he borrowed Amos' and called the ship.

"Naomi," he said once she'd picked up. "Bring the *Roci* down to the landing area. We're going to need you to offload our heavier armor and some bigger firepower."

"This doesn't sound good," she said.

"It's not. Have you heard back from the UN or Fred yet?"

"Nothing yet. I take it this means RCE and the Ganymede folks aren't in a big hurry to leave?"

"No," Holden said with a heavy sigh. "No, they'd rather stay here and kill each other right up until the alien shit starts turning them into spare parts."

"And you?" she said. She meant was he coming up the well too. It was the sane thing to do.

"Not yet," he said. "If it escalates any more, maybe."

" 'It' the aliens or 'it' the people?"

"Right?"

"Alex has seen a few more power spikes, and there's more movement, but it's pretty far south of you. If it starts looking more interesting, I'll let you know."

"Thank you. Oh, and you'll be picking up a passenger."

"Que?"

"It's complicated, but we're putting him on the *Roci* because he isn't safe down here anymore. I owe this guy, Naomi. He tried to save my life. Take good care of him."

"Okay."

"And honey?" Holden said, unable to keep the worry out of his voice. "When you get back up, keep a close eye on the *Israel*. I think things might be about to go all the way bad down here, and when they do, they may go bad up there too."

“Ha!” Naomi said, and he could hear the smile in her voice. “Let ’em try.”

Chapter Nineteen: Havelock

The corridor stretched forty meters between the recycling tanks and the secondary machine shop with hatches inset every ten meters. Open lifts at either end led to environmental control fore and hydroponics aft. The age of the *Israel* showed not only in the design of the walls and the grating of the floor, but also in the green-gray finish of the ceramic. Harsh edges at the doorways marked where safety design had improved in the decades since the ship first flew out past the orbit of Mars. A white scar splashed across one wall where something drastic had happened in some previous era of the ship's history and been patched like painting over graffiti. Havelock fought the urge to press himself into the corner nearest the doorway.

It was hard. His species had evolved in the gravity well of Earth, had grown and developed in it. His hindbrain told him that pressure meant safety. The angry whispers of the men in the hall set his heart tripping over faster, and the wall, centimeters from his back, seemed to pull at him like a magnet. It was an error waiting to happen. Lean in, push against the wall, and it would push back, sending him out into the open air of the corridor. And the firing lines. The second law of thermodynamics as applied to gunfights.

"Clear," one of the engineers said, and Havelock was torn between pleasure and annoyance. *Not clear*, he thought. They hadn't seen him, so they thought he wasn't there. He held the gun at his leg, stayed still. Waited. Didn't hug the wall.

The first man who floated by didn't notice him until he'd already been shot. Havelock's paint round bloomed orange against the man's chest. The one behind him had already launched, his body sailing between one

handhold and the next, unable to change his trajectory. Havelock hit him twice, once in the leg, then in the belly. In a real fight, there would be blood in the air now. Fine red droplets spinning into orbs and already coalescing and beginning to clot. The third man was still far enough down the corridor that Havelock didn't have a clear line of sight. Half a dozen blue paint rounds hissed past him, splattering the ceramic bulkhead. Suppressing fire. Not a bad plan, but there was no one left to exploit it.

Havelock pulled gently at the handhold behind him to keep from drifting out, reloaded his pistol, and counted incoming rounds. The "dead" engineer floated in the corridor, a sour expression on his face. Havelock counted fifteen rounds, then there was a pause and the slick metallic sound of the pistol ejecting the paint round magazine. Havelock pulled a few centimeters forward, looking down the hall. The last man—Williams—hadn't even taken cover while he fumbled to reload his gun. Havelock fired three times, hitting him only once. The accuracy on the pistols stank, but it was enough to make his point. The last engineer barked out an obscenity.

"All right," Havelock said into his hand terminal. "That's a wrap, guys. Let's get the cleanup crew out, and meet back in the conference room in thirty."

It was hard to judge the training sessions. On the one hand, they had been going for eight days now, and they were not ready for real action. The engineers weren't soldiers. The three who'd had some training earlier in life were so out of practice that they were worse than the absolute beginners. At least the novices knew they didn't know anything.

And on the other hand, they were getting better faster than Havelock had expected. With another week or ten days, they'd be at least as competent as a squad of rookies. Maybe more.

Security trainees were driven by any number of things—the need for a job, an idealistic view of helping people, sometimes just a narcissistic love of violence. The engineers weren't like that. They were more focused, more driven, and there was a palpable sense of the team against the enemy. Murtry's defeat of the terrorist cell downstairs left them at once excited and edgy, and Havelock didn't see anything wrong with the bloodthirst, so long as it was channeled and controlled.

For the next half hour, the engineers and the security team—Havelock and two others from this skeleton crew—went through the corridors, holds,

and locks cleaning up the mess from the exercise. The paint polymerized quickly, peeling off the walls and grates without flaking much or leaving fragments on the float that someone could breathe in. The engineers had also manufactured sets of personal vacuuming systems that filtered everything from tiny particles of the paint casing to volatile molecules out of the air. They laughed and joked and traded friendly insults as they worked, like junior belts cleaning a dojang. Havelock hadn't intended the cleanup as a team-building exercise, but it worked well enough that he was starting to tell himself that he had.

The conference room where they had the orientation before the exercise and the postmortem afterward had been designed for the false gravity of thrust. An oblong table was bolted to the floor with crash couches around it that the engineers didn't use. Havelock didn't know how the decision had been made to ignore the table and rotate the consensus for up and down ninety degrees, but every meeting was like that now. The engineers and security floated against the walls or in the open air, the "floor" to their right, and Havelock took his place by the main doors.

"All right," he said, and the murmur of conversations stopped. "What did we learn?"

"Not to trust motherfucking Gibbs when he tells us the corridor's clear." Laughter bubbled after, but it wasn't angry or mean. Even the man being mocked was smiling.

"Wrong answer," Havelock said with a grin. "The right answer is don't hurry when you're clearing a space. We have a natural tendency to see an empty space and think it's safe. Doors and corners are always dangerous, because you're moving into something without being sure what's there. By the time you see the enemy, you're exposed to them."

"Sir?"

Havelock pointed to the woman with the raised hand. "Yes."

"Sir, is there an algorithm for this? Because if we could get some kind of best-practice flowchart that we could study when we're not here, I think it would help us a lot."

"We could classify them by the types of doors or corners," someone else said. "And what plane we could use to approach them. Seem to me like we'd be better off shifting the axis so that whatever we're coming to reads as down."

Havelock let them talk for a while. It was funny, hearing the tactics of small-unit assault analyzed in terms of engineering, but those were his crew now. They were learning to solve violence like an equation: not to eliminate it, but to understand it fully.

“What I don’t understand,” Chief Engineer Koenen said, “is why we’re looking at the *Barbapiccola* at all.”

The eyes of the assembled team turned toward Havelock, looking for an answer. Or at least a response. A surprising nervousness crawled up his throat, and he chuckled.

“They’re the bad guys,” he said.

“The *Barbapiccola* is an unarmed freighter with a standing crew of maybe a hundred people that requires a shuttle to transfer from the surface,” the chief engineer said. “The *Rocinante* runs with less than a skeleton crew, half of which are already off the ship. It seems to me that we have a lower-risk, higher-value option here.”

A murmur of agreement passed through the room. Havelock shook his head.

“No,” he said. “First thing is just what you said. The *Barbapiccola*’s unarmed. If things don’t go well, the worst we can expect in retaliation is a strongly worded letter. The *Rocinante* was a state-of-the-art Martian warship before Holden took her to the OPA. God knows what modifications they’ve made since then. She’s got a full rack of torpedoes, PDCs, and a keel-mounted rail gun. If the crew on the *Rocinante* see us as a threat, they can end us, and there’s really nothing we can do about it.”

“But if we were the ones with that firepower—” Koenen began.

“We’d be fine as long as we stayed here,” Havelock said. “But as soon as we go back through the ring gate, there’s a whole mess of lawyers, treaties, and other ships with even bigger guns. If we have to commandeer the *Barbapiccola*, at least we have a legal argument to make.”

The engineers groaned and shook their heads. Legal arguments were another phrase for *bullshit* to them, but Havelock pressed on.

“For one thing, the ore they’re carrying is RCE property as long as the UN charter stands. For another, if they bring any of the colonists up from the surface, we can argue they’re aiding and abetting murder.”

“Argue?” one of the men in the back of the group said. The laughter that followed was bleak.

“Being true makes it a strong argument,” Havelock said. “Go after the *Rocinante*, and we look like everything they say we are. If we stand tough, we can protect ourselves and still win the long game.”

“Long game’s great if you’re around long enough to play it,” the man at the back said, but his tone of voice told Havelock that they’d seen the sense in what he said. For the time being, anyway.

Ivers Thorrsen was a geosensor analyst with advanced degrees from universities on Luna and Ganymede. He made more in a month than Havelock would in a year of working security. Also, he was a Belter. Growing up in microgravity hadn’t affected him as much as Havelock had seen in other people. Thorrsen’s head was maybe a little big for his body, his spine and legs maybe a little long and thin. With enough exercise and steroids, the man could almost have passed for an Earther. Not that it mattered. Everyone on the *Israel* knew what everyone else was. Back when they’d left home, the differences hadn’t mattered. Not much.

“In addition to the energy spikes, there are twenty heat upwellings that we’ve seen so far,” he said, pointing to the rendered sphere of New Terra on Havelock’s desk display. “They’ve all appeared in the last eighty hours, and so far we don’t have any idea what they are.”

Havelock scratched his head. The cells in the brig were empty, so there was no one to overhear them. No need to be polite.

“Were you expecting me to have a hypothesis? Because I was under the impression that we were here in order to find a bunch of stuff we didn’t know what it was. That you’ve seen something you don’t understand seems pretty much par for the course.”

The Belter’s lips pressed thin and pale.

“This could be important. It could be nothing. My point is that I have to find out. I’m busy with important work. I can’t spend all my time dealing with distractions.”

“All right,” Havelock said.

“This is the third day running that someone has sprayed urine in my locker. Three *times*, you understand? I’m trying to get my gear not to smell like piss instead of running the numbers.”

Havelock sighed and canceled out his display. New Terra and its mysterious hot spots vanished. “Look, I understand why you don’t like it. I’d be cheesed off too. But you have to cut them a little slack. People are bored and they’re under pressure. It’s natural to get a little rowdy. It’ll pass.”

Thorrson folded his arms across his chest, his scowl deepening. “A little rowdy? That’s what you see? I am the only Belter on my team, and I am the *only* one getting—”

“No. Look, just no, all right? Things are tense already. If you want me to, I’ll put a monitor on the locker and let people know they need to cool it, but let’s not make this into a Belters against the inner planets thing.”

“I’m not making it into anything.”

“With all respect, I think you are,” Havelock said. “And the more you try to make this into a big deal, the more it’s going to come back and bite you on the ass.”

Thorrson’s rage was palpable. Havelock shifted slightly, pushing himself higher in the direction that they’d temporarily chosen as up. It was an old trick he’d learned back when he’d worked with Star Helix. Humanity might have gone up out of the gravity wells, but the sense of being taller, of establishing dominance, was buried too deeply in the human animal for a little thing like null g to erase it. Thorrson took a deep, shuddering breath, and for a moment Havelock wondered if he was going to take a swing at him. He didn’t want to lock the analyst in a cell for the night. But if it came to it, he wouldn’t mind.

“I’ll put a monitor on your locker, and I’ll send out a general announcement that people need to put a sock in it. No one’ll piss on your stuff again, and you can get back to work. That’s what you want, right?”

“When you write your announcement, is it going to say that they should stop pulling pranks, or that they should stop harassing Belters?”

“I think you know the answer to that.”

Thorrson’s shoulders hunched, defeated. Havelock nodded. It struck him, not for the first time, that confrontations were like a dance. Certain moves required certain responses, and most of it happened in the lower parts of the brain that language might not even be aware of. Thorrson’s hunch was an offer of submission, and his nod accepted it, and Thorrson probably didn’t even know it had happened.

Certainly didn't, in fact, because his rational mind kept on dieseling even though everything that needed talking about was already decided.

"If you were the only Earther and it was Belters doing this, you'd feel different about it."

"Thank you for letting me know about the problem," Havelock said. "I'll see it's addressed."

Thorrson pushed off from the desk and sailed gracefully through the air, vanishing into the corridor. Havelock sighed, opened his desk display again, and paged through the ship reports. The truth was that incidents were on the rise. Most of it was little things. Complaints of petty infractions of corporate policies. Accusations of hoarding or sexual misconduct. One of the organic chemists had been making euphorics. The ship psychiatric counselor was issuing increasingly strident warnings about something he called *internal stratification*, which just sounded like social politics as usual to Havelock. He signed off on all the reports.

If you were the only Earther.

The funny thing was that Havelock had been the only Earther in a Belter society, and more than once. When he'd been on a twenty-berth hauler from Luna to Ganymede for Stone & Sibbets, he'd been one of two Earthers, outnumbered and always subtly excluded. He'd worked for Star Helix on Ceres Station for the better part of a year, always getting the worst cases, the worst partner, the less-than-subtle reminders that he didn't belong. He'd been dealt more than his fair share of shit by Belters for not having the right-shaped body or knowing the polyglot mess that passed for a kind of outer planets cant. They hadn't pissed in his locker, mostly because it hadn't occurred to them.

Havelock set a monitor specifically on Thorrson's locker, then pulled up a fresh security template. He looked at the empty field, asking him by its blankness what he wanted to say.

We're eight billion clicks from home and a bunch of half-feral terrorists want to keep on killing us, so let's stay calm.

Or maybe:

Damn near every Belter I've dealt with treated me like I was dipped in shit because of where I came from, but now that we're in the majority, let's all respect their tender little feelings.

He cracked his knuckles and started typing.

It has come to the attention of security that an increasing number of pranks have been played among the crew. While we all understand the need to keep things light in these stressful times, some of these have gone beyond the realm of good taste. As acting head of security

He paused.

Once, on Ceres, Havelock had been assigned to close down an illegal club up near the center of the station where the Coriolis had been vicious and the spin gravity at its least. When he'd gotten to the place, the combination of bright lights, shrieking dub, and his unaccustomed inner ear had left him vomiting in the carved corridors. An image of him had made its way onto the board back in the offices. He'd played along because objecting would have made it worse. He hadn't thought about that case in years.

If you were the only Earther.

"Fuck," Havelock said to the empty air. He cleared the screen.

It has come to my attention that some RCE employees and team members have been singled out for harassment because they are from the outer planets. It is critical under these stressful conditions that we not confuse our teammates with our enemies because of accidents of physiology and environments of origin. As such, I am taking the following actions:

"I'm gonna regret this," Havelock said to the screen, but by the time he'd finished the announcement, checked it for grammar, and sent it out, he felt almost good.

Chapter Twenty: Elvi

Sitting outside her hut, her hand terminal resting on her knees, the now-familiar sunlight warming her neck and back, Elvi waited for the reports from Luna to buffer. The comm laser on the *Edward Israel* was the only conduit back to the worlds she'd known, and it was swamped with technical data flowing out from the workgroups on the planetary surface and the sensor data from the *Israel*. It was sobering to realize that for all the tragedies and fear and death that wracked New Terra, most of the raw data going back home was still technical. And her slow connection was more than the townspeople of First Landing had. The *Barbapiccola* didn't even support a feed for them. Their hand terminals were strictly ad hoc, local, line-of-sight networks if they functioned at all.

A breeze lifted a whirl of sand, then set it gently down again. High above, the green clouds scattered apart and rejoined, lacing the blue sky like algae floating on the surface of a pond. The air smelled of heat and dust and the distant presentiment of rain. The reports finished loading and Elvi pulled them up and spent a long hour reading them, listening to the debates, putting together her perspective. It was harder than she liked. Her mind kept jumping around without her.

Everything was changing on the planet so quickly, everything was so different than she'd expected it to be, that just maintaining focus was hard. The voyage into the desert, seeing a two-billion-year-old mechanism actually still functioning, if only barely, had been revelatory. Then the exposure and destruction of the terrorists among the squatters, which should have been a relief, had left her oddly unsettled. And, though she hadn't mentioned it to anyone and never would, she'd been suffering recurring and

intrusive dreams about James Holden.

On the screen, the research coordinator's report ended, and Elvi realized she hadn't heard any of it. She sighed, restarted it, and stopped it again before the woman back at the RCE labs on Earth could say anything. Elvi looked up at the sky, wondering where the *Rocinante* and the *Barbapiccola* and the *Edward Israel* were, hidden by the atmosphere-scatter of blue. One of the plant analogs beside the path leading back to the town let out a volley of rising clicks. It was something she'd wanted to investigate, but she hadn't had the time. Not yet. "Doctor Okoye," the research coordinator said from sixty AU away, or half a galaxy depending on how you looked at it, "I've just come from a meeting with the stats team, and I wanted to bring you up to speed on the plan for how we'd like to proceed with the data collection in the next weeks. The Luna group especially was hoping to request additional sampling on several of your initial subjects so that we can narrow our error bars..."

Elvi listened, focused, pushed away all her other thoughts and feelings. This time, she ended the report with a list of action items, a clear sense of how her work was changing the resources and plans of the labs back at home, and a half dozen questions about mineral sequestration that she wanted to ask Fayez. Protocol said she should record a reply and send it out right away. The hours it would take to reach home meant it would arrive before the morning meetings. But instead, she switched to her organizer and began listing her obligations. Water samples and soil samples. Samples of three different plant analog species. A report on the alien artifact...

She'd been thinking about possible triggers to the artifact's sudden activity, and since Holden had been there and was, after all, the mediator who was ultimately responsible for making the situation on New Terra better—sensible, sane—she thought maybe, if she could give a solid reason that the artifact in the desert wasn't moving in reaction to their presence, it would take something off his plate. Just as a kindness, and to help support him in making peace.

Certainly it wasn't just that she was generating excuses to see him again.

She went down the list of things to do, then paused. At the end, she wrote, *Letter of recommendation for Felcia Merton*. She sat for a long moment, looking at the words, trying to decide how she felt about them. She erased the line, waited, and then entered it in again.

Walking into the town was like entering another world, and a harder one. The dirt streets weren't empty, but the people who walked them stayed closer to the walls than they had before. The smiles and nods, the eye contact and simple greetings were all gone. The townspeople walked quickly, with their heads down. Elvi had the urge to stand in their way, block them with her body until they acknowledged that she was there.

The building where it had happened stood near the edge of town. The fire had melted what it hadn't burned. The bones of the structure still stood, charred and tilted in the afternoon sun. She paused before them. They reminded her of something, but she couldn't quite remember what. Something dead. Something about fire.

Oh. Of course. The artifact, burning in the desert.

Two of the RCE security force walked down the street in front of her, striding in the middle of the road. She couldn't make out their words, but the tone of the conversation was bright, loose, and celebratory. One of them laughed. Elvi turned, walking toward them. As they passed, one of them lifted a hand in greeting and Elvi returned it automatically. Across the street, one of the Belter women—Eirinn her name was—stepped out from a door, saw the security forces, and hesitated before she came out into the light. Elvi watched the woman walk, her head a little too high, her shoulders pulled a little too far back. Nothing proved fear like the effort of rejecting it. First Landing had belonged to that woman once.

Elvi stepped into the commissary, hoping to find Holden at his traditional table. The room was dim, and it took her eyes a moment to adjust. The other one, Amos Burton, was there instead, eating a bowl of brown noodles that smelled of fake peanuts and curry. In the back, Lucia Merton sat in a booth with someone. Elvi looked away before the doctor met her gaze.

Amos looked up at her as she came close.

"I was wondering if Captain Holden... I wanted to talk with him. About the artifacts? In the desert?"

"Something happen with it?"

"I had some theories about it that I thought might be... useful."

Oh good God, she thought. I'm stuttering like a schoolgirl. Thankfully, Amos didn't notice, or if he did he pretended not to.

"Captain's off getting ready to transfer the prisoner," Amos said. "Should be back around sundown."

"All right," Elvi said. "That's fine. If you'd tell him I was looking for him? I'll likely be in my hut by the time he's back. He can find me there."

"I'll let 'im know."

"Thank you."

She turned away, fists pushed into her pockets. She felt humiliated without being entirely certain why she should. She was just going to offer some perspective on the artifacts and the local ecosystem. There was nothing about it that was at all inappropriate or—

"Elvi!"

She felt her belly drop. She turned toward the back, toward the booth where Lucia Merton sat. Fayeze had swiveled around in the chair and was waving at her. She looked at the door to the street, wishing there was some graceful way to get through it.

"Elvi! Come sit. Have a drink with us."

"Of course," she said, and walked toward the back of the commissary, regretting every step as she took it.

Doctor Merton looked pale except for the bags under her eyes. Elvi wondered if the woman was ill, or if it was just distress and grief.

"Lucia," Elvi said.

"Elvi."

"Sit, sit, sit," Fayeze said. "You're standing there, I feel short. I hate feeling short."

Elvi smoothed the fabric of her pants and slid in next to Fayeze. His smile was beery and amused. Lucia's glance at her was almost an apology. *You could have sat next to me*, she seemed to say.

"We were just talking about Felcia," Fayeze said, then turned to Lucia. "Elvi is the smartest person on the team. Seriously, do you know that she's the one who wrote the first real paper on cytoplasmic computation? That's her. Right there."

"Felcia's told me about you," Lucia said. "Thank you for being a friend to my daughter."

Your family tried to kill me, Elvi thought. *You shared your bed every*

night with a man who wanted me dead.

“You’re welcome,” she said. “She’s a very talented girl.”

“She is,” Lucia said. “And God knows I tried to talk her out of being a doctor.”

“You were hoping she’d stay?” Elvi asked, and her voice was more brittle than she’d intended.

“Not that, no,” Lucia said, laughing. “That she’s leaving this planet is the only good thing that’s happened since we came. It’s only that I’m afraid she’s doing it because it’s what I do. Better that she find her own way.”

“It’s a long way to Luna,” Fayez said. “I mean, I had five major courses of study before I fell in love with geohydraulics. I was going to be a brewer. Can you imagine that?”

Elvi and Lucia said *Yes* at precisely the same time. Elvi smiled despite herself. Lucia stood.

“I should go get Jacek,” she said.

“Is he all right?” Elvi asked. It was a reflex. A habit of etiquette. She wished she could take the question back even as the words left her mouth. The doctor’s smile was wistful.

“As well as can be expected,” she said. “His father is leaving today.”

Taken prisoner on the Rocinante, Elvi thought, but said nothing.

“Your money’s no good here,” Fayez said. “It’s on me.”

“Thank you, Doctor Sarkis.”

“Fayez. Call me Fayez. Everyone else does.”

Lucia nodded and walked away. Fayez shook his head and stretched, his arm reaching behind Elvi’s shoulders. She shifted to the opposite side of the table.

“What the hell are you doing?” she asked.

“What am *I* doing? You think that’s the question?”

“You know that her husband—”

“I don’t know a damned thing, Elvi. Neither do you. I’m rich in interpretation and poor in datasets, just the same as you.”

“You think... you think it’s not...”

“I think that building was filled with terrorists, and that Murtry killed them and saved us. That’s what I *think*, though. I also think that the more the locals know and love me, the less likely it is that I’ll be scalped in the next uprising. And... and what is civilization if it isn’t people talking to

each other over a goddamned beer?” Fayeze said, then lolled his head back over his shoulder. “Am I *right*?”

“Fuckin’ A,” Amos called back. “That sure is whatever you were talking about.”

“That’s right,” Fayeze said.

“You’re drunk.”

“I’ve been doing this for a while,” Fayeze said. “I’ve probably had drinks with a third of the people in this shithole. What I want to know is where the rest of you are while I’m making peace.”

For a moment, she could see his fear too. It was in the angle of his jaw and the way his half-closed eyes cut to the left, avoiding hers. Fayeze who could laugh at anything, however tragic, was scared out of his wits. And why wouldn’t he be? They were billions of clicks from home, on a planet they didn’t understand, and in the middle of a war that had now killed people on both sides. And how odd and obvious that it would be a victory for their side—the nameless, faceless killers identified and killed or imprisoned—that would call up the panic.

Fayeze was waiting. Waiting for the next escalation. The other shoe to drop. He was reaching out for whatever control he could find or hope for or pretend into being. Elvi understood, because she felt just the same, only she hadn’t known it until she saw it in someone else.

He scowled down at the table, then, slowly, his gaze floated up to meet hers. “What *are* you doing here?”

“Sitting with you, apparently,” she said.

Waiting for the other shoe.

Chapter Twenty-One: Basia

Basia stood at the edge of the landing area, steel shackles damp with his sweat and chafing his wrists and forearms. Murtry had insisted on restraints until Basia was off-planet, though he had given the key to Amos, and the big man had assured Basia he'd be uncuffed once the *Rocinante* lifted off. It was one last visible demonstration to the citizens of Ilus that Murtry could and would exert his will upon them. Jim Holden was still trying to play the peacemaker, and he'd agreed to the restraints in exchange for Basia being released into his custody without any further threats or considerations. Basia understood why everyone was doing what they were doing.

It didn't make it less humiliating.

Lucia and Jacek stood with him, waiting for the *Rocinante* to land. Jacek stood in front of him, back pressed to his father's stomach and Basia's cuffed hands on his shoulders. His wife's hand, gripping his own, rested on his son's shoulder. All three of them touching. He tried to draw strength from it. Tried to lock the sensation of having his wife and his son close to hand into his memory. He had the terrible sense that it was the last time he'd ever feel her touch. He felt both relief and sadness that Felcia was already gone. Bad enough that his son, too young to really understand what it all meant, had to see him in chains. He could not have stood his bright, beautiful girl seeing him that way.

The other townspeople—men and women he had lived with sharing air and water and sorrow and rage—avoided the spectacle of his departure as if his guilt were an illness they might catch. He'd become a stranger to them. He might almost have preferred to have them condemn him.

All I wanted was my freedom. All I wanted was my family with me, and

not to lose another child to them. He was amazed and sick at heart that that had been too much to ask of the universe.

Amos, his nominal guard, stood a respectful distance away, arms crossed and staring up at the sky. Giving the family the space to say goodbye. Holden stood with Murtry and Carol, the triumvirate of power on Ilus. They weren't looking at each other. They were there to take the sting off of Murtry exerting his control by pretending they were part of the decision. His life was a pawn in their political games. Nothing more.

"Just a couple more minutes, chief," Amos said. A moment later came a high-altitude thunderclap. The *Rocinante*, dropping through the atmosphere faster than sound, descending on them all like the angel of judgment.

It seemed unreal.

"I'm happy having you two here with me right now," he told Lucia. It wasn't even a lie.

"Find a way to come back to us," she said.

"I don't know what I can do."

"Find a way," she repeated, making each word its own sentence. "You do that, Basia. Don't make me grow old on this world alone."

Basia felt something thick blocking his throat, and he had trouble breathing around the pain in his stomach. "If you need to find someone..."

"I did," Lucia said. "I found someone. Now he needs to find a way to come back to me."

Basia didn't trust himself to speak. Worried that if he opened his mouth it would turn into a sob. He didn't want Murtry to see that. So instead he put his cuffed arms around Lucia and pulled her tight and squeezed until neither of them could breathe.

"Come back," she whispered one last time. Anything she might have said after that was drowned out by the roar of the *Rocinante* landing. A wall of dust blew past, stinging the bare skin on Basia's neck. Lucia pressed her face into his chest, and Jacek clung to his back.

"Time to go," Amos shouted.

Basia let go of Lucia, hugged his boy to his chest one last time, *the* last time maybe, and turned away from them both to board his prison.

"Welcome aboard, Mister Merton," a tall, pretty woman said when the inner airlock door opened. She wore a simple jumpsuit of gray and black with the name Nagata stenciled over the breast pocket. Naomi Nagata, the

executive officer of the *Rocinante*. She had long black hair pulled into a ponytail, the same way Felcia had worn hers when she was a young girl. On Naomi it looked more like a functional choice than an aesthetic one. She didn't appear to be armed, and Basia felt himself relax a degree.

He handed her the key to his restraints and she unlocked them. "Basia, please," he said as she worked. "I'm just a welder. No one has ever called me Mister Merton."

"Welder?" Naomi asked. It didn't sound like she was making pleasantries. She took the restraints, rolled them into a ball, and secured them in a locker. Shipboard discipline, where any free object became a projectile during maneuvers. "Because we always have a repair list."

The compartment they stood in looked like a storage room laid on its side. The lockers ran parallel to the ground, rather than vertically, and there was a small hatch on either wall, with what looked like a ladder running across the floor. Naomi tapped on a panel on one wall and said, "Strapping in down here, Alex, get us off this dustball before my knees start leaking."

A disembodied voice with a Martian Mariner Valley twang said, "Roger that, boss. Up in thirty ticks, so get belted in."

Naomi pulled on a strap on the floor and a seat folded out. It was designed so a person would have to lie on the floor on their back to put their butt on the seat. A variety of restraining belts folded out with it. She pointed at another strap in the floor and said, "Better get with it. We lift in thirty seconds."

Basia pulled out his own seat and awkwardly lay on the ground to get into the straps. Naomi helped him buckle in.

The Martian voice counted down from five, and the floor lurched as the ship lifted off. There was a disorienting rotation, and the floor became a wall behind him and he was actually sitting on the cushion he'd pulled out. He became very grateful for the straps holding him in place.

Then a giant roared at the bottom of the ship, and an invisible hand crushed Basia into his chair.

"Sorry," Naomi said, her voice given a false vibrato by the rumbling of the ship. "Alex is an old combat pilot, he only flies at full speed."

As always when flying out of a gravity well, Basia was surprised by how quickly it was over. A few minutes of crushing gravity and the roar of the engines, then with almost no transition at all, he was floating in his

straps in silence.

"All done," Naomi said as she began unbuckling. "Might be a few short maneuvering bumps as Alex gets us into the orbit he wants, but those yellow lights on the wall will flash fifteen seconds before any burn, so just grab a strap and hang on."

"Am I a prisoner?" Basia asked.

"What?"

"I'm just wondering how this works. Am I restricted to my room or is there a brig or something?"

Naomi floated for a moment staring at him, forehead crinkling with what looked like genuine puzzlement. "Are you a bad guy?"

"Bad guy?"

"Are you going to try to hurt anyone on this ship? Destroy our property? Steal things?"

"Definitely not," Basia said.

"Because the way I heard it, you turned on your friends in order to save our captain's life."

For a moment, Basia felt something like vertigo and then pride or the promise of it. And then he remembered the concussion of the heavy shuttle rattling him and Coop's voice. *We all remember who mashed that button.* He shook his head.

Are you a bad guy?

Naomi Nagata waited for him to speak, but he didn't have words for the guilt and shame and anger and sorrow. In time she lifted a fist, the Belter's physical idiom for a nod. He lifted his in reply.

"Make yourself at home." She pointed at the hatch to his right. "That's aft. That way is the crew decks and the galley. The galley is open whenever. We've got a cabin set up for you, it's tiny but private. If you keep going aft and hit the machine shop you've gone too far. For safety reasons don't go into the machine shop or engineering."

"Okay, I promise."

"Don't promise, just don't go in there. The other way"—she pointed at the hatch on his left—"takes you up to the ops deck. You can come up there if you want, but don't touch anything unless we tell you to."

"Okay."

"I'm headed up there right now. You're welcome to tag along."

“Okay.”

Naomi stared at him for a second, an unreadable expression on her face. “You’re not our first, you know.”

“First?”

“First prisoner transport,” Naomi said. “Jim has this thing about fair trials. It means that we’ve done our share of taking people to court even when an airlock and mysteriously erased records made a lot more sense.”

Basia couldn’t stop himself from giving the airlock door a nervous look. “Okay.”

“And,” she continued, “you’re the first one I can remember that he specifically told me to be nice to.”

“He did?”

“He owes you one. I do too,” Naomi said, then gestured at the ladder and the deck hatch in a you-first motion. Basia pulled himself up to the hatch and it whined open. Naomi pulled herself along behind him. “So you can get comfortable. But the terrified mousey thing you’re doing right now will bug the shit out of me.”

“Okay.”

“Still doing it.”

The deck above the storage and airlock area was a large compartment filled with gimbaled chairs and wall-mounted screens and control panels. A dark-skinned man with thinning black hair and a middle-aged beer belly was strapped into one of the chairs. He turned to face them as they floated into the room.

“All good?” he asked Naomi. He was the source of the Mariner Valley voice.

“Seems to be,” Naomi said, and pushed Basia into the closest chair then strapped him in. He allowed it to happen, feeling like an infant being manhandled by his mother. “Didn’t get any face time with Jim. He wanted this fellow off the ground as fast as possible.”

“Well, can’t say I was lookin’ to stay longer.”

“I know. Gravity wells,” Naomi said with a shudder. “I don’t know how people live like that.”

“I was thinking more about the bugs all coming back to life. I got five more power spikes since the last time we checked.”

“I was trying not to think about those.”

“Should have gotten Holden and Amos both,” Alex said. “And anyone else with sense.”

“Just keep an eye. If anything gets close, I want them to know about it.”

Once she’d finished belting him in, Naomi floated over to a different chair and pulled herself into it. She began calling up screens and tapping on them faster than Basia could follow, still talking to the Martian man as she worked.

“Alex,” she said, “meet Basia Merton the welder.”

“Welder?” Alex raised his eyebrows and grinned. “We got a pile of shit on the to-do list with Amos vacationing on the surface.”

Basia opened his mouth to reply but Naomi said, “Basia, meet Alex Kamal, our pilot, and the solar system’s worst vacuum welder.”

“Hello,” Basia said.

“Hello back,” Alex said, then turned to Naomi. “Hey, while I’m thinkin’ about it? You were right about that shuttle.”

“Yeah?” Naomi pushed off her chair and floated over to look at the screen next to Alex. He scrolled through what looked like video on fast-forward for a few seconds.

“See there?” Alex said, pausing it. “They detach it and park it a few hundred meters from the *Israel* then send an engineerin’ team out. They’re inside for a couple hours, then back to the *Israel*. It hasn’t moved out of that orbit since.”

“They’re doing all the shuttle runs with the other one,” Naomi said, pulling up video on a second screen and fast-forwarding through it. “I knew it.”

“Yeah, you’re very clever. Want to keep the ’scopes recording that, or do I aim ’em at the bugs?”

“The shuttle,” Naomi replied after a few more seconds of moving back and forth through the video.

Basia knew he’d been invited to sit with them. And it appeared they were talking about monitoring the RCE ship, which didn’t strike him as a personal conversation. But he couldn’t help but feel a bit out of place. Like an eavesdropper on a private moment. It was the comfortable shorthand the two members of the *Rocinante*’s crew had. They sounded like family discussing household matters. It was unsettling to think they were the only three people on the ship. It was too large. Too empty. He didn’t want to be

alone in the silence of an unfamiliar ship, but staying felt wrong too.

Basia cleared his throat. "Should I go to my cabin?"

"Do you want to?" Naomi asked without looking at him. "There is nothing to do in there. It's not even one of the ones with its own video display. All the good cabins are taken by crew."

"You can get access to the ship's library from there," Alex said, pointing at the screen closest to Basia. "If you're bored."

"I'm scared as shit," Basia said without knowing ahead of time he was going to.

Alex and Naomi both turned to look at him. The Martian's face was kind. He said, "Yeah. I bet. But nothin' bad is gonna to happen to you here. Until the captain says otherwise, treat this like home. If you want to be alone, we can—"

"No." Basia shook his head. "No, but you're talking to each other like I'm not here, so I thought..." He shrugged.

"Sorry. We've been together enough years we almost don't need to talk anymore," Naomi said. "I think the *Israel* has weaponized one of its shuttles. We've been monitoring the ship, and the activity around one shuttle was suspicious. I think they turned it into a bomb."

"Why would they do that?"

"Because," Alex answered, "that's an unarmed science ship and they flew into what they seem to see as a war zone. That shuttle could be used to attack another ship like a guided missile, or maybe as a bomb to flatten the colony."

"They want to attack you?" Basia asked. *Why would they do that? Wasn't the Rocinante and her crew here to solve the conflict?*

"I doubt it," Naomi said. "More likely the *Barbapiccola* if she tries to break orbit and run."

"Yeah," Alex said with a laugh. "The *Israel* takes a swing at us, it'll be the shortest dogfight in history."

"First Landing. They could flatten the colony?" Basia said. "They don't know that. You should warn them. My family is still down there."

"Trust me," Naomi said, "that won't happen. Now that we know, we'll keep an eye on that shuttle, and if it moves, we can stop it."

"Should probably tell the boss, though," Alex said.

"Yeah." Naomi tracked through the video a few more times, then shut it

off.

Alex unbuckled his restraint and pushed off toward the ladder. “Or... shit, XO, I can take care of it right now. I had the *Roci* go over the shuttle specs and calculate a rail gun shot that’ll cut her damn reactor in half.”

Naomi stopped him with a shake of her hand. “No. Just once I’d like to find a solution that doesn’t involve blowing something up.”

Alex shrugged. “Your call.”

Naomi floated quietly for a moment, then seemed to come to a decision and hit the comm panel. After a few seconds Jim Holden’s voice said, “Holden here.”

“Jim, I’ve got a problem and a solution I need to run past you.”

“I like that we already have a solution,” Holden replied. Basia could hear the smile in his voice.

“Two solutions,” Alex called out. “I’ve got a solution too.”

“We’ve been watching the *Israel* like you asked,” Naomi said. “And Alex and I agree that the probability is high they’ve weaponized one of the two light shuttles. They’re keeping it powered down and in a matching orbit about five hundred meters from the big ship. I think it’s a last-ditch weapon to use if the *Barb* tries to run, but that doesn’t mean they couldn’t use it on the colony, as unlikely as that seems.”

“You haven’t met this Murtry character running RCE security,” Holden said. “Or it would seem pretty damn likely. What’s our best course of action?”

“We get everyone off the planet, go back home, and spend a few decades doing unmanned exploration before we even think of coming back,” Naomi said.

“Agreed,” Holden said. “And what are we actually going to do?”

“I figure you’d want us to take care of it. Alex thinks he can gut it with a rail gun shot, but that seems like a pretty obvious escalation to me. Shooting gauss rounds past the *Israel*, I mean.”

“Things are escalating just fine on their own,” Holden said. “But we’ll keep that option on the table for now. What else?”

Naomi pulled herself closer to the comm panel and lowered her voice, as though the console were Holden himself and she was about to deliver bad news. “I take an EVA pack, fly over to the shuttle, and plant a cutout on the drive. If they run system checks, everything will come back functional, but

if they try to move the shuttle I can kill it remotely. No explosions, just a dead shuttle.”

“That seems risky,” Holden said.

“Riskier than flinging rail gun shots through its reactor?”

“Not really, no.”

“Riskier than leaving it out there and armed?”

“Oh, *hell* no. Okay, Naomi, this is your call. One way or the other, I want that threat off the board. We have enough shit to worry about down here.”

Naomi smiled at the comm panel. “One dead shuttle, coming up.”

She shut off the connection with a sigh. Basia looked from one to the other of them, scowling.

“Why?”

“Why what?” Naomi asked lightly.

“Why would you act directly against RCE? Aren’t you supposed to be mediators? Neutral? Why take any action at all when you can stay out of it?”

Her smile had depth and complexity. Basia had the feeling she’d heard a more profound question than the one he’d meant to ask.

“Choosing to stand by while people kill each other is also an action,” she said. “We don’t do that here.”

Chapter Twenty-Two: Havelock

Havelock's system filtered the newsfeeds from Sol—and it was still damned weird thinking “from Sol”—for four topics: New Terra, James Holden, contract security, and European league football. Strapped in his office crash couch, he tapped through the feed summaries. CHANGES TO COMPENSATION SCHEDULE REGULATIONS TIP THE BALANCE TOWARD EARTH-BASED CONTRACT SECURITY, STAR HELIX TO PROTEST. He deleted it. EARTHMAN'S BURDEN: FIFTY FAMOUS EARTHERS WHO SWITCHED SIDES FOR THE OPA. Holden was number forty-one. Havelock deleted it. LOS BLANCOS DEFEAT BAYERN 1–0. Havelock raised his eyebrows and put the highlights reel in his viewing queue. INCREASED VIOLENCE ON NEW TERRA. UN AND OPA REACT. MARS POSITIONING WITH OPA.

Havelock felt his belly go tight. The feed came from an intelligence analysis service with contacts in the governments of all three major powers. He opened it.

“This is Nasr Maxwell with Forecast Analytics, and this proprietary feed is intended solely for use by the subscribers and partners of Forecast Analytics. Any other distribution is in violation of MCR and UN intellectual property statutes and is subject to prosecution.

“Intelligence reports from the UN indicate that the violence on New Terra has escalated. The security forces of Royal Charter Energy discovered a new potential attack, and in thwarting it killed between seven and sixteen local insurgents. Reaction from the OPA to the attack itself has been muted, but the RCE and United Nations forces will be announcing this afternoon that a relief mission will be launched for New Terra. Initial reports suggest this will be a joint task force with both corporate assets and United Nations

military escort.

“Representatives of the OPA have not responded to this plan, but are on record as being willing to use military force to control traffic through Medina Station. Given the tactical constraints of the ring gates, Forecast Analytics projects the possibility of a modest OPA military force being able to effectively blockade the UN and RCE efforts. Sources close to the Martian congress speaking with Forecast Analytics under condition of anonymity have suggested that the Martian government would support the OPA’s action.

“Analysis suggests that this is not evidence of a long-term amity between the OPA and Mars, but a tactical alliance intended to forestall the UN and Earth-Luna corporate structures from establishing a greater foothold in these new worlds. Given the time it will take a UN and RCE group to be assembled and make the journey to Medina Station, we predict that the situation on New Terra will be evolving without immediate physical involvement from in-system players for the foreseeable future, and the greater question of how traffic through the gates will be regulated will be a source of high-level tension and probable military action in the coming months and years.”

Havelock scratched his ear. Prior experience told him that Forecast Analytics was usually about a day ahead of the mainline, non-proprietary feeds. Which would mean that in about thirty hours they’d be getting flooded with news and opinion pieces about themselves from people who’d never been farther than the Jovian system. Even if it only changed the stories that the people downstairs were telling about themselves, it could make things even worse. If the squatters knew there were more RCE ships coming—even if they weren’t going to be here for years—maybe they’d get even more desperate. Or maybe Mars getting in bed with the OPA would make them think they had support back home. Either way, nothing good could come of it.

Havelock wished there was a way to shut down the communication to the ring, just as a way to keep the dramatics of national politics contained. Things were screwed up enough without getting the professional-class screwups at the UN involved. More than they already were, anyway. At least they hadn’t picked up on the UN/OPA mediator deciding the planet was full of boojams and was telling everyone to run away and hide under

their blankets. Or, on second thought, maybe it would have been better if they had. It would be a distraction, anyway.

His hand terminal squawked, and he accepted the connection.

“I think we’re about ready,” Chief Engineer Koenen said.

“I’ll be right there,” Havelock replied, releasing the couch straps. He pushed off toward the door and hauled himself hand over hand toward the airlock.

He slid into the storage deck where his little militia was waiting, his brain arbitrarily deciding that the bank of lockers was down, the airlock door up. Human brains needed an answer, even if they had to make up something they knew was bullshit. A dozen people floated in the space. Havelock started talking to them as he lifted his own vacuum suit out of the locker at his feet.

“Good to see you today, team. So we’re going to do a practice breaching. It’s going to be a lot like last time, except this time we’re going to have a squad that’s trying to stop you.”

One of the men at the back shook a paint gun and hooted. The others around him laughed. Havelock pulled on the vacuum suit and started working the seals. He left the helmet off for the moment so that he could speak through the free air.

“Do we have teams set up?”

“I’m taking Alpha and Beta,” Koenen said. “Figured you could lead the Gamma on attack.”

“That works,” Havelock said. He shifted his paintball gun from side to side, getting a feel for its mass. “You have the emergency airlock?”

“Here,” one of the Beta team said, twisting to show his backpack. The bright yellow box held a bubble of adhesive-backed polymer bound to a second sheet that was fitted with a seal and an inflating tank the size of Havelock’s thumb. Laid out properly on the hull of a ship, it would look like a hemispherical blister and contain up to two atmospheres of pressure indefinitely or eight for a full tenth of a second. Havelock wasn’t actually going to let the engineers cut through the hull of the *Israel*, but he was going to make sure they could get everything ready up to the moment when they’d fire up the torch welders.

“All right,” he said. “Now before we get out there, remember we’re on the outside of a ship, and the shuttle is on the planet. The chances of your

drifting to where we can't get you back are non-zero."

The little bit of joking and whispering stopped. Havelock looked through the room, making eye contact with several of them as if his gaze were enough to make them safe.

"All these suits have mag boots," he said. "They only work for a few centimeters, so they'll keep you against the ship, but they won't pull you back to it. For that you have the grapnel lines. You've all trained with those?"

A murmur of general assent answered him.

"All right. If you're drifting, the grapnel line will adhere to any metal surface on the hull. They've got their own propellant, so there won't be any kick. Do not under any circumstances pass through or stop in any of the areas marked in red. Those are maneuvering thruster outlets, and while we aren't planning to make any adjustments, don't assume it. We're not doing this to lose anyone else.

"If you get out there and you start feeling too hot or like there's something wrong with your air feed, you're probably having a panic attack. Just let me or the chief know, and we'll pause the exercise and get you inside. If you start feeling wonderful and powerful and like you've seen the face of God, you're having a euphoric attack, and those are more dangerous than the panic. You aren't going to want to tell us about those, but you have to. All right?"

A ragged chorus of *Sir, yes sir* echoed through the room. Havelock tried to think of what else he should say. He didn't want to insult their intelligence, but he didn't want anything to go wrong either. In the end, he shrugged, fastened the helmet, and gave the order through the exercise frequency.

"Alpha and Beta teams, into the lock. You've got thirty minutes."

There were three exercise-specific settings on the suit radio. One was open to all the people going out. One was just for Havelock's team, and the last was between him and Koenen. The mom-and-pop channel, the chief engineer called it. Havelock opened all the channels, but all he could hear was the banter of his own group. The chief and his men weren't transmitting. After ten minutes, Havelock switched to the mom-and-pop channel.

"Okay," he said. "We're coming out."

There was a crackle as the chief switched.

“That wasn’t thirty minutes.”

“I know,” Havelock said, and the chief chuckled.

“Okay. Thank you for the heads-up. I won’t give it away.”

Astronomy had never been a particular interest of Havelock’s, and living in a ship or station, he’d seen actual stars less often than he did in his childhood on Earth. The starscape around New Terra was beautiful, familiar and unfamiliar at the same time. The few constellations he knew—Orion, Ursa Major—weren’t there, but he still looked for them. The bright smear of the galactic disk was still part of the sky, and the local sun could pass for Sol. More or less, anyway. New Terra’s ring of tiny moons caught the light, their low albedo making them hardly more than the stars behind them. The *Edward Israel* was moving at something like eight thousand kilometers a minute. That this stillness masked a velocity that was orders of magnitude faster than a rifle shot was intellectual knowledge. What he felt was motionless. He stood on the skin of the ship, rooted by his mag boots, shifting gently like seaweed on the ocean floor. To his right, New Terra’s terminator seemed to inch across its vast ocean. To his right, the shuttle stood half a kilometer out, looking small and forlorn against the vast night. His strike force stood around him, craning their necks, in awe of the massive emptiness all around. He was almost sorry to pull his attention back to the small, vaguely intimate necessities of violence.

He checked to be sure he was speaking on the channel exclusive to his group. “All right. Their target area for setting up the emergency lock is aft of the main storage area. We’re going around clockwise. In ten minutes, we’ll be moving into eclipse. If we come up from between the primary maneuvering thrusters and hangar bay, we should have the sun behind us. So let’s get moving.”

The small chorus of excited *yessirs* told him they liked the idea. Coming out of the sun, raining death on the enemy. It was a pretty enough plan. The only things that kept it from happening were their unfamiliarity with the mag boots and the fact that Koenen had placed the emergency airlock a hundred meters farther away than Havelock had expected. The bright moment passed, and the sun shifted behind New Terra, where it would stay for almost twenty minutes.

“Okay,” Havelock said, “Plan B. Everyone turn off your helmet lights.”

“What about the indicators on our external batteries, sir?”

“We’re going to have to hope they’re dim enough that—”

One of the engineers to his left raised the paint gun and turned it on himself. The muzzle flash was like a spark.

“What the hell are you doing?” Havelock demanded.

“I figured if I got some paint on the indicator light, I could—” the man began, but it was too late. Koenen’s men had seen the muzzle flash. Havelock tried to get his forces to hunker down close to the skin of the ship and fire across the ship’s shallow horizon, but they kept rising up to see if they’d struck anything. In less than a minute, the last of his men reported an enemy hit and Havelock called the exercise to a halt. The massive dark bulk of the planet was almost above them now, the sunlight a soft ring where the atmosphere scattered it. The two groups gathered.

The airlock was only half attached, and three of his team’s paintballs had smeared it. Two of the chief engineer’s boarding party had been hit. The rest were elated. Havelock set his team and the wounded of the opposition to cleanup, and the disgraced soldiers started repacking the airlock.

“Nice work,” Havelock said on the mom-and-pop channel.

Koenen grunted. His arms were crossed awkwardly over his chest, the bulk of the suit defying the pose. Havelock frowned, not that anyone could see him.

“Something the matter, chief?”

“You know,” the chief engineer said, “I don’t mind that the *Israel* has her own engineering crew. I understand that we’ve got separate mandates. But we’re working with the same equipment and supplies, and as a courtesy, I would like to be kept in the loop when the ship crew are sending out a team.”

“Okay,” Havelock said. “I can talk to them when we get in. Is it something that’s been happening often?”

“It’s happening right now,” the chief said, pointing out into the darkness.

It took Havelock a moment to see it. A flicker where no flicker should be. The weaponized shuttle brightened and dimmed. A welding torch, half a klick away in the darkness. Panic felt strange in null g, the blood flowing away from his hands and feet.

“Do you have enhanced magnification on your helmet?” Havelock asked.

“Yeah,” the chief said.

“Could you take a look at who’s out there?”

The chief engineer bent back. The surface of his helmet glittered for a moment, the HUD taking over. “Red EVA suit. Got a decent-sized pack on it too. Long-distance travel. And a welding kit.”

Havelock said something obscene, then switched to the all-group channel. “Everyone stop. We have a problem. There’s someone at the shuttle over there, and he isn’t one of ours.”

For a moment, no one spoke. Then one of the militiamen, his voice calm and matter-of-fact, said, “Let’s go kick his ass.”

It was exactly not what Havelock wanted to do. If the enemy had a rifle, he could pick half the team off before they got close. Even then, they had paint guns. But the alternative was to let whoever they were do whatever they were doing to the only ace up the *Israel*’s sleeve.

“Okay,” Havelock said. “Here’s the plan. Everyone sync up with the ship’s computer. We’re going to let the *Israel* calculate our burns. Turn off the mag boots.” He plucked out his hand terminal, fed in the emergency security override, and coded in his request. Their vacuum suits had more than enough propellant to get them all to the shuttle and back again, provided nobody missed or tried to do something clever. Above them, the penumbra around New Terra grew lopsided, the sun preparing to reemerge. Another tiny dawn. The computer announced the burns were ready.

“Okay,” Havelock said. “These are the bad guys. We don’t know how many there are. We don’t know how they’re armed. So we’re going to try to scare them off. Everyone get your gun at the ready. Look threatening, and *don’t fire*. If they figure out our guns aren’t real, we may be in for a bad time.”

“Sir?” one of the men said. “You remember we’re covered with target paint, right?”

Before Havelock could answer, the thrusters started, pushing compressed gas out behind them like a fog and smoke. All their suits rose together into the night. Or else fell. The acceleration pushed the blood into Havelock’s legs, and the suit squeezed, pressing it back. It wasn’t even a full g. It was hardly a third, but it felt like something much, much faster. Much more dangerous. Now that he knew to look for it, the welding flicker was obvious. It didn’t stop. The main burn cut out, and the suits rotated,

starting the braking burn. The perfect synchrony meant the *Israel* was still coordinating them.

This time, the intruder saw them. The welding torch died. Havelock looked down between his feet, his paint gun centered between his toes, waiting for the bullets to start streaming out and praying that they wouldn't.

They didn't.

"It's working!" one of the men shouted. "Motherfucker's running away!"

And there it was. A red EVA suit on the skin of the shuttle. It struggled with something, looked up toward Havelock and his militia descending upon him, and turned back. Whoever it was, there was only one of them. The braking thrust stuttered. They were almost at the shuttle now. Fifty meters. Forty. Thirty. Havelock opened a standard general-response channel.

"Attention unidentified welder. You will stand down."

The red suit stood, the EVA suit firing off. The person lifted at a ninety-degree angle, not going directly away from them, but diving down toward the planetary surface and whatever lower orbit would mean a safe rendezvous. Havelock felt the relief flooding him. They weren't shooting. His HUD promised him that the shuttle's basic functions were unchanged. It hadn't been set to detonate. And the militia boys weren't in charge of their own burns, so they wouldn't be taking off after the intruder.

He had underestimated them.

The first dark thread rose out toward the intruder and missed, but once the whole team had seen the grapnel fire, the idea was out there. A half dozen grapnels fired, their propellant flaring blue and orange as they flew like tiny missiles toward the fleeing welder. Then one made contact. The enemy and the man who'd fired the grapnel both jerked, and the engineer's suit started an emergency burn, trying to compensate. With the enemy encumbered and slowed, two more grapnels connected. Soon five of his people had lines attached to the saboteur, their collected thrusters holding the red suit's EVA pack in check. Havelock took control of his suit back from the *Israel* and dropped down toward the planet and the prisoner.

The red suit was twisting now, trying to bring its welding torch to bear on the lines. Havelock raised his gun, and the enemy paused. He was close enough now that he could see the face behind the helmet. A Belter woman,

dark-skinned, with wavy dark hair clinging to her sweaty forehead. Her expression was pure chagrin.

He opened the general channel again.

“Hi,” he said. “Don’t panic. My name’s Havelock. I’m acting security chief for the *Edward Israel*, and you have to come with me now.”

Interlude: The Investigator

—it reaches out it reaches out it reaches out it reaches out—

One hundred and thirteen times a second, it reaches out, and the things it finds are not the signal that would let it end, but they are tools, and it explores them without knowing it is exploring them. Like water finding its mindless way through a bed of pebbles, it reaches out. What it can move, it moves, what it can open, it opens. What it can close, it closes. A vast network, ancient and dead, begins to appear, and it reaches into it. The parts of it that can think, struggle to make sense of it. Parts of it dream of a mummified body, its dry heart pumping dust through petrified veins.

Not everything responds, but it reaches out, presses, *moves*. And some things move back. Old artifacts awaken or don't. None of them are what it seeks. None ever will be. It experiments without awareness of experimenting, and a landscape begins to form. It is not a physical landscape, but a logical one—this connects to this connects to this. It builds a model and adds it to the model it already has, and does not know it has done so. It reaches out. One hundred thirteen times a second, it reaches out.

Something that worked once, stops working. It reaches out and what answered before answers less now. Something burns or fails or tries to rise up and breaks. Part of the map goes dark, dies, and it reaches out to the silent dead. Part of it feels frustration, but it is not aware of that part, and it reaches out. Part of it wants to scream, wants to die, wants to vomit though a mouth it imagines has been transformed into something else for years now. It does not experience these things, though parts of it do. It reaches out.

And it pulls back.

It is unaware of pulling back, but one time out of every seventeen

million attempts, it touches something and will not touch it again. It is not aware of pulling back, because it is not aware of anything, but the failures accrue. A blank place forms, an emptiness. A void. Avoid. Jesus, an old woman thinks, now with the puns.

The map is not physical, but it has a shape. It is a model of part of the universe. It becomes more detailed, more concrete. Some things come alive and then die. Some do not answer ever. Some become tools, and it uses the tools to reach out, except not *there*.

The emptiness gains definition too. With every failed connection, with every pulling back its liminal borders become better defined. It struggles to make sense of the shape of the nothing that defies it. The structures of the minds that never died within it struggle with it. It is a cyst. It is a negative space. A taboo. It is a question that must not be asked. It is not aware that it thinks these things. It is not aware that the space exists, that when it reaches into that place, it dies.

It does not need to be aware of the problem. It has a tool for this. A thing that finds what is missing. A tool for asking questions that shouldn't be asked. For going too far. The investigator considers the cyst, the shadow, the space where nothing is.

That right there? The investigator thinks. Yeah, where I come from, we'd call that a *clue*.

Chapter Twenty-Three: Holden

Come on,” Holden said to the empty desert and the man who wasn’t there. “You show up every time I don’t want you around. But I get something I want to talk to you about, and nothing.”

The thing that had been Miller didn’t answer. Holden sighed, hoped, and waited.

Ilus had lost some of its strangeness. The moonless sky still felt too dark, but no darker than a new moon on earth. His nose had become accustomed to the planet’s strange scents. Now it just smelled like night and the aftermath of rain. His growing familiarity was both comforting and sad. Humans would go out to the thousand worlds of the gate network. They would settle down in little towns like First Landing, then spread out and build farms and cities and factories, because that’s what humans did. And in a few centuries, most of those worlds would be very similar to Earth. The frontier would give way to the civilizations that followed it. Remaking it in the image of their original home.

Holden had grown up in the Montana district of North America. A region filled with nostalgia for lost frontiers. It had held out against urban creep longer than most places in the former United States. The people there clung to their farms and ranches even when those things stopped making economic sense. And because of that, Holden couldn’t help but feel the allure of the untamed place. The romantic notion of sights no one else had seen. Ground no one else had walked.

This new frontier would last throughout Holden’s lifetime. Conquering and taming a thousand-plus planets was the work of generations, no matter how much of a head start the protomolecule’s masters had given them. But

in his heart, Holden knew that conquered and tamed they would be. And then there would be a thousand Earths with steel-and-glass cities covering them. Holden felt a shadow of that distant future's loss of mystery as though it were his own.

In the moonless black sky, a star moved too quickly. One of the ships. The *Israel* or the *Barbapiccola*. The *Rocinante* was too small and too black to reflect the light. Did the people up there think about how momentous what they were all doing was? Holden worried that they didn't. That the strangeness had already become normal, like the night scents of Ilus. That all they saw now was the conflict to be won and the treasure to be harvested.

With a sigh, Holden turned back toward the town and started walking. Amos would be wondering where he was. Carol, the town administrator, had asked for an after-dinner meeting so he needed to track her down too. A fat, dog-shaped thing with a bullfrog's head walked in front of him and made a sound like boots crunching on gravel. Mimic lizards, the locals called them. They were sort of scaled like a lizard, but to Holden the limbs looked all wrong. Holden took out his hand terminal and used it to shine a faint light on the creature. It blinked up at him and made the gravel noise again.

"You'd be a good pet if you didn't vomit your stomach up periodically," Holden said, crouching down to get a better look at the creature. It croaked back at him. Nothing like the words he'd used, but a surprisingly good imitation of his voice and tones. He wondered if the animals could be taught to speak words like a parrot.

The terminal in his hand buzzed. The lizard skittered away, buzzing back at him over its shoulder.

"Holden here."

"Yeah, Cap," Alex said. "I got some bad news."

"Bad like the zero-g toilet on the *Roci* is out of order, or bad like I should be looking at the sky for incoming missile trails?"

"Well..." Alex started, and then took a long breath. Holden looked up at the sky. Just stars.

"You've scared me now. Spit it out."

"Naomi," Alex started, and Holden felt his heart drop. "She was out installing the remote cutout on the shuttle, and they were doin' some kind

of group exercise on the outside of the *Israel* and they spotted her. Just dumb luck, really.”

“What happened? Is she okay?” Please be okay.

“They got her, Cap,” Alex said. Holden felt his chest go empty.

“Got her. Like, *shot* her?”

“Oh! No. Captured. She’s not hurt. The security guy on the *Israel* called to make sure I knew she was unharmed. But they’re callin’ it sabotage, and they locked her up.”

“Fuck,” Holden said, able to breathe again. He knew who’d have authorized that. Murtry. And now that the RCE security chief had a big bargaining chip he’d go all-in. “Does anyone else know?”

“Well, Amos called up looking for her a minute ago—”

Holden didn’t hear the rest of what Alex said, because he was already running toward town. The longer he ran without hearing gunfire, the more hopeful he became that Amos had realized the sensitivity of the situation, had decided to wait and consult with his captain before taking any action. He hoped Amos wasn’t already on the radio with the *Israel* and a pistol held to Murtry’s head demanding Naomi’s safe return.

He was half right.

When he burst into Murtry’s security office he found the RCE security chief pressed to one wall with Amos’ left hand around his throat and a pistol against his forehead. At least no one had called the *Israel* with demands. Likely because Amos didn’t have a free hand to dial.

In addition to Murtry and Amos, four RCE security personnel stood around the room with drawn sidearms pointed at Amos’ back. One of them, a raven-haired woman named Wei, said, “Drop the gun or we’ll shoot.”

“Okay,” Amos said with a shrug. “Blast away, sweetie. I guarantee I take this piece of shit with me. I’m good. You good?” He leaned closer to Murtry, punctuating the question with a jab of the pistol against his forehead. A little trickle of blood had started to run down Murtry’s face from the force of the barrel pressed against it.

Murtry smiled. “Keep barking, dog. We both know there’s no bite coming. You shoot me, she’s dead.”

“You won’t know,” Amos said.

“Don’t, Amos,” Holden ordered.

“Oh, do,” Murtry said, the words almost a whisper.

Holden held his breath, sure the next thing they heard would be a gunshot. Amos surprised him by not firing. Instead he leaned in even farther until his nose was touching Murtry's and said, "I'm gonna *kill* you."

"When?" Murtry replied.

"That is exactly the question that should stay on your mind," Amos said and let the man go.

Holden started breathing again with a gasp. "I've got this, Amos."

The big mechanic holstered his gun, to Holden's relief, but made no move to leave.

"Seriously. I've got it. I need you to go back to the rooms and get on the line with Alex. Get me a full report. I'll be back there in a minute."

For a moment, Holden thought Amos would argue with him. The mechanic stared back, face flushed with rage, his jaw clenched hard enough to crack his teeth. "Okay," he finally said and then left. The other four security people kept their guns trained on him the entire time.

"That was smart," Murtry said. He pulled a tissue out of a box on his desk and wiped the blood from his forehead. He had an ugly bruise forming around the cut Amos' pistol had left. "Your boy almost didn't make it out of this room, *mediator*."

Holden surprised himself by laughing. "I've never seen Amos pick a fight he didn't plan to win. I'm not sure what he had in mind, but even at five to one my money would be on him."

"Everyone loses eventually," Murtry said.

"Words to live by."

"That's quite the killer you have working for you, as critical as you are of my methods."

"There's a difference. Amos is willing to lose face to protect something he loves. He doesn't need to win more than he needs to keep his friends alive. And that's why you're nothing alike."

Murtry agreed with a nod and a shrug. "So if you weren't here to save your man, then what?"

"We keep escalating," Holden said. "Some of that is my fault. *I* asked Naomi to deal with the shuttle."

"Sabotage—" Murtry started.

"But I did that in response to finding out you'd weaponized it. We keep reacting to what the person before us did, justifying ourselves like kids on a

playground. ‘He started it.’ ”

“So you’ll be the first to break the cycle?”

“If I can,” Holden said. “You’ve gone too far, Murtry. Disable the shuttle, give me Naomi back. Let’s see if we can find a way to stop the escalation.”

Murtry’s vague smile shifted into an equally vague frown. The man leaned back on his desk and touched another tissue to the cut on his forehead. It came away with a single crimson spot. Then he folded his arms, casual but immovable. Holden knew that it was a deliberate affectation intended to look natural. He was both impressed and worried by anyone who had that level of self-awareness and control.

“I’ve acted entirely within the purview of my assignment here,” Murtry said. “I’ve protected RCE assets and personnel.”

“You’ve killed a bunch of colonists and kidnapped my XO,” Holden replied, trying to keep the anger out of his voice and failing.

“I’ve killed fewer squatters than they’ve killed of us, all of which were actively engaged in plotting and carrying out attacks on RCE assets and personnel. Which, as I said, is my job.”

“And Naomi—”

“And I captured a saboteur and am holding her pending an investigation. ‘Kidnapping’ is not only a provocative term, it’s inaccurate.”

“You want this to blow up.” Holden sighed. “You can’t wait for the next chance to make things worse, can you?”

The frown shifted back to the smile. Neither meant anything. Just different masks. Holden wondered what it looked like inside Murtry’s head and shuddered.

“I’ve done the minimum necessary at each step,” the man said through his disquieting grin.

“No,” Holden replied. “You could have left. You had the *Israel*. After the first attack on the shuttle you could have pulled your people out and waited for the investigation. A lot of people would still be alive if you had.”

“Oh no,” Murtry said, shaking his head. He stood up and uncrossed his arms. Every movement slow and deliberate and conveying threat. “No, that’s one thing we won’t do. We won’t give up a centimeter of ground. These squatters can throw themselves against us until every one of them is shattered into dust, but we’re not going anywhere. Because that...”

Murtry's smile sharpened.
"... is also my job."

The walk from the RCE security shed back to his room at the community center wasn't a long one, but it was very dark. Miller's faint blue glow illuminated nothing, but it was oddly comforting anyway.

"Hey, old man," Holden said in greeting.

"We need to talk." Miller grinned at his own joke. He made jokes now. He was almost like a real person. Somehow that was more frightening than when he'd been insane.

"I know, but I'm kind of busy with keeping these people from killing each other. Or, you know, us."

"How's that working for you?"

"Terrible," Holden admitted. "I've just lost the only real threat I had to make."

"Yeah, Naomi being on their ship makes the *Rocinante* a non-factor. Letting her anywhere near that ship was a dumb mistake."

"I never told you about that."

"Should I pretend I'm not inside your head?" Miller asked with a Belter shrug. "I'll do it if it makes you more comfortable."

"Hey, Miller," Holden said. "What am I thinking now?"

"Points for creativity, kid. That'd be difficult to pull off and less fun than you might expect."

"So stay out."

Miller stopped walking and grabbed Holden's upper arm. Again he was surprised at how real it felt. Miller's hand felt like iron gripping him. Holden tried to pull away and couldn't. And all of it was just the ghost pushing buttons in his brain.

"Wasn't kidding. We need to talk."

"Spit it out," Holden replied, finally yanking his arm away when Miller let go.

"There's a spot a way north of here I need to go look at."

"By which you mean you need *me* to go look at."

"Yeah," Miller said with a Belter nod of one fist. "That."

Against his will, Holden felt his curiosity piqued. "What is it?"

"So, turns out our coming here caused a little ruckus with the locals," Miller said. "May have noticed. Lot of leftover stuff waking up all over the planet."

"Yeah, I wanted to talk to you about that. Is that you? Can you control it?"

"Are you kidding? I'm a sock puppet. Protomolecule's got its arm so far up my ass, I can taste its fingernails." Miller laughed. "I can't even control myself."

"It's just that some of it seems dangerous. That robot, for instance. And you were able to turn off the station in the slow zone."

"Because *it* wanted me to. You can order the sun to come up if you time it right. I'm not driving this bus. Making it do what I want would be like talking someone out of a seizure."

"Okay," Holden said. "We have got to get off this planet."

"Before that, though, there's this thing. This not-thing. Look, I've got a pretty good map of the global network. Lots of leftover stuff coming up, checking in. Except one spot. Like a big ball of nothing."

Holden shrugged. "Maybe it's just a place where there are no nodes on the network."

"Kid, this whole planet is a node on the network. There shouldn't be anyplace that's off-limits to me."

"So what does it mean?"

"Maybe it's just a spot that's really really broken," Miller said. "That'd be interesting but useless."

"And the useful thing?"

"It's a leftover bit of whatever killed this place."

They stood in silence for a moment, the cool evening wind of Ilus ruffling Holden's pants and not affecting the detective at all. Holden felt a chill start at the base of his spine and slowly climb his back. The hairs on his arms stood up.

"I don't want to find that," he finally said.

"And I do?" Miller replied with his best attempt at a friendly smile. "Free will left the conversation for me a while back. But that's where the clues are. You should come with. It's going to happen eventually anyway."

"Why is that?"

“Because real monsters don’t go away when you close your eyes. Because you need to know what happened here just as bad as I do.”

Miller’s expression was still friendly, but there was a dread in it too. A fear that Holden recognized. And shared.

“Naomi first. I don’t go anywhere until we get her back.”

Miller nodded again and flew apart into a spray of blue fireflies.

Amos was waiting for him when he got back to the bar. The big man sitting alone at a table with a half-empty bottle of something that smelled like antiseptic and smoke.

“I’m guessing you didn’t kill him after I left,” Amos said as Holden sat down.

“I feel like I’m walking a tightrope so narrow I can’t even see it,” Holden replied. He shook his head when Amos offered him the bottle, so the mechanic took a long swig from it instead.

“This ends in blood,” Amos said after a moment. His voice sounded distant, dreamlike. “No way around that.”

“Well, since my job is pretty much exactly the opposite of that, I hope you’re wrong.”

“I’m not.”

Holden lacked a compelling argument, so instead he said, “What did Alex have to say?”

“We put together a list of demands for the captain of the *Israel*. Make sure Naomi gets well taken care of while she’s there.”

“What will we give up in exchange?”

“Alex isn’t blowing the *Israel* into its component atoms right this second.”

“I hope they agree we’re being generous.”

“He is, however,” Amos continued, “keeping a constant rail gun lock on the *Israel*’s reactor.”

Holden ran his fingers through his hair. “So not too generous, then.”

“Say pretty please, but carry a one-kilo slug of tungsten accelerated to a detectable percentage of c .”

“I believe I’ve heard that said,” Holden replied, then stood up. He suddenly felt very tired. “I’m going to bed.”

“Naomi’s in Murtry’s goddamn brig, and you can sleep?” Amos said and took another drink.

“No, but I can go to bed. Then tomorrow I’m going to figure out how to get my first officer back from the RCE maniac holding her hostage, so that I can go find the scary alien bullet fragment embedded in the planet.”

Amos nodded as if that all made sense. “Nothing in the afternoon, then.”

Chapter Twenty-Four: Elvi

Elvi slept, and she dreamed.

In her dream she was back on Earth, which was also the corridors of the *Edward Israel*. A sense of urgency pressed at her, shifting quickly toward dread. Something was on fire somewhere because she hadn't turned in the right forms. She had to file the forms before everything burned. She was in the bursar's office at the university and Governor Trying was there too, only he was waiting for his death certificate and it was taking too long. She couldn't submit her forms. She looked at the onionskin papers, trying to find the submission deadline, but the words kept changing. First, the line at the bottom read, *Elvi Okoye, lead researcher and Argonaut*, and the next time she read it, *Fines to be paid directly at the temple: rabbits and hogs*. The urgency pushed at her, and when she shouted the onionskin started coming apart in her fingers. She tried to press the forms back together, but they wouldn't go.

Someone touched her shoulder, and it was James Holden, only he looked like someone else. Younger, darker, but she knew it was him. She realized she'd been naked this whole time. She was embarrassed, but also a little pleased. His hand touched her breast, and—

“Elvi! Wake up!”

Her eyes opened, the lids heavy and slow. Her eyes struggled to focus. She didn't know where she was, only that some dumb bastard was interrupting something she didn't want interrupted. The dark lines before her slowly became familiar. The roof of her hut. She shifted, reaching out for someone but already uncertain who. She was alone in her bed. Her hand terminal glowed dimly. Her analysis equipment flickered as data from her

work flew up and out, through the vast darkness to the Ring and Medina Station, to Earth, and answering information flew back out to her. Which was all fine and as it should be, so why the hell was she awake?

A soft knock came at the door, and Fayez's voice. "Elvi! Wake up. You've got to see this."

Elvi yawned so deeply her jaw ached with it. She pulled herself up to sitting. The dream was already fading quickly. There had been something about a fire and someone touching her whom she had badly wanted to be touched by. The details lost all coherence as she sat up and reached for her robe.

"Elvi? Are you there?"

When she spoke her words were slow, heavy, a little slurred. "If this isn't important, I will rip your throat open and piss down your lungs."

Fayez laughed. There were other voices behind his. Sudyam saying something too low to make out the words. Yma Chappel, the geochemistry lead too. Elvi paused, threw off the robe, and pulled on her real clothes and work boots to go with them. When she stepped out of her hut, a dozen of the people in the research teams were standing in pairs or small groups all across the night-dark plain. They were all looking up. And in the high darkness, something larger than a star glowed a sullen red. Fayez, squatting on the ground, glanced over at her.

"What is that?" Elvi asked, her voice instinctively low, as if she might startle it.

"One of the moons."

She stepped forward, her neck back, scowling up at the night. "What's it doing?"

"Melting."

"Why?"

"Right?" Fayez said, standing up.

Sudyam, to their left, raised her voice. "Makes you wish we'd sent probes there, doesn't it?"

"We're one ship, and this is a whole damn planet," Fayez said. "Plus which, we've been focusing a lot of effort on killing each other."

"Point being?" Sudyam asked.

Fayez spread his hands wide. "We've been busy."

The moon shifted colors for a moment, turning from dull red to a bright

orange to yellow-white, and then back down the spectrum again, waning as suddenly as it had waxed.

“Is anyone recording this?” Elvi asked.

“Caskey and Farengier aborted the high-altitude refraction study and started sucking down data from it as soon as they saw it was happening. Mostly, it’s visible light, heat, and about thirty percent more gamma particles than background. The sensor array on the *Israel*’s showing about the same thing.”

“Is it dangerous?” Elvi asked, knowing the answer even as she spoke the words. Maybe. Maybe it was dangerous, maybe it wasn’t. Until they knew what it was, all they could do was guess. In the starlight, Favez’s expression was difficult to make out. The apprehension at the corners of his mouth and in the curve of his eyes might only have been her imagination. Another kind of dream. “Do the others know?”

“I guess so,” Favez said. “Assuming they’re not too busy taking each other prisoner and setting people on fire.”

“You told Murtry?”

“I didn’t. Someone probably did.”

“And Holden? What about him? Does he know?”

“Even if he does, what’s he going to do about it? Speak to it reassuringly?”

Elvi turned toward First Landing. The few lit houses were like a handful of stars fallen to the ground. She took out her hand terminal, setting its screen to white and using it as a torch.

“Where are you going?” Favez called from behind her.

“I’m going to talk to Captain Holden,” she said.

“Of course you are,” Favez said with an impatient grunt. “Because what would be useful for him is a biologist’s perspective on it.”

The words stung a little, but Elvi didn’t let herself be drawn into the conversation. Favez was a good scientist and a friend, but his habit of making fun of everything and derailing anything serious for the sake of humor also made him less useful than he should have been. One of the others should have made sure everyone knew that something was happening overhead. It shouldn’t have had to be her. And still, she quietly did hope that she would be the one to bring the news.

The dry air smelled like dust and the tiny, night-blooming flower

analogs. Where there had been a few tough, ropy plants, months of foot traffic had made paths, and Elvi followed them as easily in the near-darkness as she would have in the day. It occurred to her, not for the first time, that the scattering of huts, the ruins, and even First Landing itself had become as familiar to her as anyplace else she'd lived. She knew the land, the feel of the breezes, the smells that rose and fell at different times of day. Over the past month, she had been the ears and eyes of the whole scientific community back in the solar system. Even when the terrorists had killed Reeve, and Murtry had come down, at least a part of her day had been running samples and transmitting data back home. She had spent more time not just in but *with* this environment than anyone else.

Above her, the tiny red moon reminded her that she still didn't know much. Normally, that would have been a delight and a challenge. In the darkness of the New Terran night, it felt like a threat. Her steps took on a rhythm, her boots tapping against the wind-paved stones.

In the town, people were in the streets much like they had been out by the RCE huts. They stood in the streets and on their little cobbled-together porches, looking up at the glowing dot as it drifted toward the horizon. Elvi couldn't say if they were curious or apprehensive or just wanting something to think about that wasn't the conflict between RCE and the squatters. Between *us* and *them*.

Or maybe they were seeing it as an omen. The burning eye looking down on them all, judging them and preparing for war. She'd heard a folktale like that once, but she didn't remember where.

Wei and one of the other RCE security men were walking down the main street, rifles at the ready. Elvi nodded to them, and they nodded back, but no one spoke. Probably someone had told Holden. But she'd come all this way. She should at least be sure.

In the street outside the commissary where Holden was living, Jacek Merton was pacing. The boy's body leaned into the motion, his hands at his sides clenched in fists. His gaze was fixed about three feet in front of him like someone looking at a screen, and his shoulders were hunched in like he was protecting something. She was about to say hello, when a small warning bell chimed in her head.

Between one heartbeat and the next, she wasn't Elvi Okoye going in the middle of the night to see Captain Holden on pretenses that even she could

see were pretty damned flimsy. That wasn't the son of Lucia and Basia Merton, brother of Felcia, in front of her. This wasn't even a town. She was a biologist in the field seeing a primate. And in that frame of reference, some things were perfectly clear. The boy was working himself up to violence.

She hesitated and started to turn back. Wei was only a few dozen meters and a corner or two away. If Elvi shouted, the security people would probably come at a run. Her pulse was quick. She could feel it in her throat. The long hours after Reeve's death came back to her like a recurring nightmare. She should scream. She should call for help.

Except the boy wasn't just a primate. Wasn't just an animal. He was Felcia's brother. And if she called for help, they might kill him. She swallowed, caught between fear and courage. Uncertain. What would Faye do? she wondered. Offer the kid a beer?

He stopped and looked up at her. His eyes were empty. He wore a light jacket that pulled down a little on one side, like he had something heavy in his pocket.

"Hi," she said, smiling.

A moment later, Jacek said, "Hi."

"Weird, isn't it?" She pointed up at the red dot. It seemed more portentous than ever. Jacek glanced up at the sky, but didn't seem to react to it.

"Weird," he agreed.

They stood in front of each other, the silence rich and tense. The light spilling from the commissary windows left the boy half in light, half in shadow. Elvi struggled, trying to find something to say. Some way to defuse everything and make it all okay. Faye would have made a joke, something that the boy could laugh at and that would put them both on the same side of the laughter, and Elvi didn't know what it was.

"I'm scared," she said instead, her voice breaking a little. It surprised the boy as much as it did her. "I'm just so scared."

"It's okay," Jacek said. "It's just some kind of reaction up there. It's not like it's doing anything but melting up in orbit."

"Still scared, though."

Jacek scowled at his feet, torn between the errand he'd been steeling himself for and the impulse to say something kind and reassuring to this

obviously unstable, vulnerable, strange woman.

“It’ll be okay?” he tried.

“You’re right,” she said, nodding. “It’s just. You know. I mean, you do know, don’t you?”

“I guess.”

“I was coming to see Captain Holden,” she said, and Jacek’s eyes flickered like she’d said something insulting. “Were you too?”

She could see in his face as he tried to bring back the blankness he’d had before, the tightness and anger and emptiness. He wasn’t someone for whom violence came naturally. He’d had to put effort into it. It was that effort she’d seen in him.

“He took my father away,” Jacek said. “Mom worries we’ll never see him again.”

“Is that why you came? To ask?”

Jacek looked confused.

“Ask... what?”

“To talk to your father.”

The boy blinked, and he took an unconscious step toward her. “He won’t let me talk to him. He took him prisoner.”

“People talk to prisoners all the time. Did someone tell you that you couldn’t talk to your dad?”

Jacek was silent. He put his hand into his jacket pocket—the heavy one—and then took it out again. “No.”

“Come on, then,” Elvi said, moving toward him. “Let’s go ask him.”

Inside the commissary, Holden was pacing from the front of the room to the back to the front again. The big man—Amos—sat at a table with a pack of cards, playing solitaire with an unnerving focus. Holden’s face was paler than usual, and the sense of barely restrained emotion gave his body a tension that she didn’t picture him with. Amos looked up as she walked in, her hand on Jacek’s shoulder. His eyes were flat and empty as marbles, and his voice was just as cheerful as ever.

“Hey there, doc. What’s up?”

“Couple things,” Elvi said.

Holden stopped. It seemed to take him a second to focus. Something was bothering him. His gaze locked on her and he tried to smile. An unexpected tightness came to her throat. She coughed.

“Jacek was wondering if there was any way he could talk with his father,” Elvi said. There didn’t seem to be much air in the room, she was having a hard time catching her breath. Maybe she was developing allergies.

“Sure,” Holden said, then looked over his shoulder at Amos. “That’s not a problem, is it?”

“Radios still work,” Amos said. “Might want to give Alex the heads-up to expect it. His hands are kind of full right now.”

“Good point,” Holden said, nodding to himself as much as any of them. “I’ll set that up. Do you have a hand terminal?”

It took Jacek a moment to realize the question was directed at him. “It doesn’t work. We don’t have a hub. It’s all just line-of-sight.”

“Bring it over when you can, and I’ll see if I can’t put it on our network. That’ll be easier than setting up times for you to use mine. Will that work?”

“I... Yeah. Sure.” She could feel the boy’s shoulder trembling. Jacek turned and walked out without meeting anybody’s gaze, but especially avoiding hers. The door closed behind him.

“Kid was packing, boss,” Amos said.

“I know,” Holden replied. “What did you want me to do about it?”

“Know. That’s all.”

“Okay, I know. But I really don’t have time to get shot right now.” He turned his attention to her. A lock of hair was dropping down over his forehead, and he looked tired. Like he was carrying the whole planet on his back. Still, he managed a little smile. “Is there anything else? Because we’re a little...”

“Is this a bad time? Because I can—”

“Our XO got arrested by Murtry,” Amos said, and the flatness of his eyes had gotten into his voice now. “May be a while before there’s a really good time.”

“Oh,” Elvi said, her heart suddenly picking up its pace. *The XO is Holden’s lover and Holden has a lover and Holden may not have a lover anymore and Jesus, what am I doing here* all collided somewhere in her neocortex. Elvi found she was very unsure what to do with her hands. She tried putting them in her pockets, but that felt wrong so she took them out again.

“I’d been thinking?” she said, her voice rising at the end of the word

even though it wasn't a question. "About the thing. In the desert. And now with the moon?"

"Which moon?"

"The one that's melting down, Cap," Amos said.

"Right, that one. I'm sorry. I've got a lot of things going on right now. If it's not something I can actually do something about, it's not sinking in the way it probably ought to," Holden said. And then, "I'm not supposed to do anything about the moon thing, am I?"

"We can let the scientists tell us if we're supposed to freak out," Amos said. "It's all right."

"I've been thinking about hibernation failure rates, and that maybe what we were seeing was analogous."

Holden lifted his hands. "I couldn't tell you."

"It's just that hibernation is a really very risky strategy? We only see it when conditions are so bad that the usual kinds of survival strategy would fail. Bears, for instance? They're top predators. The food web in wintertime couldn't sustain them. Or spadefoot toads in the deserts? In the dry periods, their eggs would just desiccate, so the adults go dormant until there's rain, and then they come back awake and go out to the puddles and mate furiously, just this mad kind of puddle orgy and... um, anyway, and then they, they lay their eggs in the water before they can dry out again."

"Ok-ay," Holden said.

"My point is," Elvi said, "not all of them wake up. They don't have to. As long as enough of the organisms reactivate when the time comes, enough that the population survives, even if individuals don't. It's never a hundred percent. And shutting down and coming back up is a complicated, dangerous process."

Holden took a deep breath and ran his hands through his hair. He had thick, dark hair. It looked like he hadn't washed it in a while. Amos lost his game, scooped up the cards, and started shuffling them with slow, deliberate movements.

"So," Holden said, "you think that these... things we're seeing are artifacts or organisms or something trying to wake up?"

"And failing. At least sometimes," she said. "I mean, the moon melted. And that thing in the desert was clearly broken. Or anyway, that's what it was looking like to me."

“Me too,” Holden said. “But just because it was moving, we kind of knew things were waking up.”

“No, that’s not the point,” Elvi said. “There are always a small percentage of organisms that don’t wake up, or wake up wrong. These things? If that’s the model, they’re the ones waking up *wrong*.”

“Following you so far,” Holden said.

“Failure rates are usually low. So why aren’t we seeing a bunch of things waking up *right*?”

Holden went over to the table and sat on its edge. He looked frightened. Vulnerable. It was strange seeing a man who’d done so much, who’d made himself known across all civilization by his words and deeds, look so fragile.

“So you think there are more of these things—maybe a lot more—that are activating, and we’re just not seeing it?”

“It would fit the model,” she murmured.

“All right,” he said. And a moment later, “This isn’t making my day better.”

Chapter Twenty-Five: Basia

Basia sat alone on the operations deck of the *Rocinante*. He was belted into a crash couch next to what he'd been told was the comm station. The controls were quiet, waiting for someone to request a connection, occasionally flashing a system status message across its screen. The messages were incomprehensible mixtures of acronyms, system names, and numbers. The text was in a gentle green font that made Basia think they weren't particularly urgent.

Alex was in the cockpit, the hatch closed. That didn't mean anything. The hatches closed automatically to seal each deck from the others in case of atmosphere loss. It was a safety measure, nothing more.

It still felt like being locked out.

The panel startled him with a burst of static followed by a voice. The volume was just loud enough that Basia could tell it was a conversation between two men without understanding any of the words. A red RECORDING status blinked in one corner of the screen. The *Rocinante*, monitoring and recording all of the radio transmissions around Ilus. Maybe Holden was doing that on purpose to have a record of his mission when he returned to Earth. Or maybe warships did it by default. It wasn't something that a welder had to worry about. Or a miner. Or whatever he'd been with Coop and Cate.

Basia was looking for a way to turn up the volume and listen in when Alex's voice blared from the panel. "Got a call comin' in."

"Okay," Basia said, not sure if the pilot could hear him. He didn't know if he needed to press a button to respond.

The message on the comm panel changed, and a male voice said, "You

don't need to do anything."

For a moment, Basia had the irrational feeling that the person speaking had read his mind. He was about to reply when another voice, younger, male, said, "Just talk?" Jacek. The second voice was Jacek. And now Basia recognized the older voice as Amos Burton. The man who'd guarded him at the landing field. "Yeah," Amos said. "I've opened a connection to the *Roci*."

"Hello?" Jacek said.

"Hey, son," Basia replied around the lump in his throat.

"They made our hand terminal work again," Jacek said. By *they* Basia guessed he meant Holden and Amos.

"Oh yeah?" Basia said. "That's real good."

"It only talks to the ship," Jacek said, his young boy's voice bright with excitement. "It doesn't play videos or anything like it used to."

"Well, maybe they can make it do that too, later."

"They said someday we'll be on the network, like everyplace in Sol system. Then we can do whatever."

"That's true," Basia said. Water was building up in his eyes, making it hard to see the little messages flashing by on the screen. "We'll get a relay and a hub and then we can send data back and forth through the gates. We'll have everything on the network then. There's still going to be a lot of lag."

"Yeah," Jacek said, then stopped. There was a long silence. "What's the ship like?"

"Oh, it's pretty great," Basia said with forced enthusiasm. "I have my own room and everything. I met Alex Kamal. He's a pretty famous pilot."

"Are you in jail?" Jacek asked.

"No, no, I get to go anywhere I want on the ship. They're real nice. Good people." *I love you. I am so sorry. Please, please be all right.*

"Does he let you fly it?"

"I never asked," Basia said with a laugh. "I'd be scared to, though. It's big and fast. Lots of guns on it."

There was another long silence, then Jacek said, "You should fly it and blow up the RCE ship."

"I can't do that," Basia said, putting as much smile in his voice as he could. Making it a joke.

"But you should."

“How’s your mom?”

“Okay,” Jacek said. Basia could almost hear the shrug in his voice. “Sad. I started playing soccer more. We have enough for two teams, but we trade players a lot.”

“Oh yeah? What do you play?”

“Fullback right now, but I want to play striker.”

“Hey, defense is important. That’s an important job.”

“It’s not as fun,” Jacek said, again with the verbal shrug. There was a long silence while both of them reached for something to say. Something that could be said. Jacek gave up first. “I’m gonna go now, okay?”

“Hey, wait a minute,” Basia said, trying to keep the thickness in his throat from changing his voice. Trying to keep his tone light, fun. “Don’t run off yet. I need to ask you to do something.”

“Got a game,” Jacek said. “Pretty soon. They’ll get mad.”

“Your mom,” Basia said, then had to stop and blow his nose into the sleeve of his shirt.

“Mom what?”

“Your mom will work too much, if you don’t watch her. She gets to looking things up at night. Medical things. And she won’t get enough sleep. I need you to make sure she gets some sleep.”

“Okay.”

“It’s serious, boy. I need you to look after her. Your sister’s gone, and that’s good, but it just leaves you to help out. You gonna help out with this?”

“Okay,” Jacek said. Basia couldn’t tell if the boy was sad or angry. Or distracted.

“See you, son,” Basia said.

“See you, Pop,” Jacek replied.

“Love you,” Basia said, but the signal had already died.

Basia wiped his eyes with the sleeves of his shirt. He floated against his restraints, breathing deep, ragged breaths for a full minute, then pulled himself over to the crew ladder. He moved aft, deck hatches opening at his approach and slamming shut behind him as he went, the sound echoing through the empty ship.

He changed shirts in his room, then spent a few minutes in the head cleaning his face with wet towels. They had a large shower unit—he

couldn't remember the last time he'd had a real shower—but it only worked when the ship was under thrust.

When he no longer looked like a man who'd been bawling, Basia floated back along the ladder to the cockpit. He was considering whether or not it was polite to knock before entering when he drifted too close to the hatch's electronic eye and it snapped open with a hiss.

Alex was belted into the pilot's chair, the large display directly in front of him spooling out ship status reports and a rendering of Ilus, its single massive continent dotted with red and yellow marks. And one green dot that was First Landing. The pilot scowling at the screen tensely as though he could will the universe to do something. Like he could make it give his crew back.

Basia was turning to leave when the deck hatch banged shut and Alex looked up.

"Hey," he said and tapped out something on the panel.

"Hello," Basia said.

"How'd your call go? Everything okay?"

"Fine. Thank you for letting me use the radio."

"No problem, partner," Alex said with a laugh. "They don't charge us by the hour."

An uncomfortable silence stretched out that Alex pretended not to notice by pressing buttons on his controls. "Am I allowed to be up here?" Basia finally asked.

"I don't mind," Alex said. "Just, you know, don't mess with anything."

Basia pulled himself into the chair behind Alex and belted in. The armrests of the chair ended with complex-looking joysticks, so Basia was careful not to bump them.

"That's the gunner's seat," Alex said, turning his entire chair around to face Basia.

"Should I not—"

"Naw, it's fine. It ain't on. Push buttons there all you want. Hey, wanna see somethin' cool?"

Basia nodded and put his hands on the two control sticks. They were covered with buttons. The gunner's seat. Those sticks might control the *Rocinante's* lethal weaponry. He wished Jacek could see him sitting there, holding the controls.

Alex turned around and did something on his own panel, and the screen in front of Basia came to life with a view matching Alex's own. Basia looked at the bright limb of his planet, trying to find the location of First Landing. Without the green dot overlay it was impossible in daylight. If they were on the night side he could have spotted them as a spark of light.

Alex did something else, and the view shifted to a dull red blob of molten rock. "That's the moon goin' meltdown. It wasn't a very big one, but still, kinda makes you wonder what could melt a hunk of rock that size."

"Do we know?"

"Hell no. Some kind of alien protomolecule shit'd be my guess."

Before Basia could ask for more details, the radio squawked at them. "Alex here," the pilot said.

"Kid's gone, wanted to check in," Amos' voice said.

"How's the captain doing?" Alex asked.

"Not great. And once again he stopped me from doing the obvious thing."

"Shooting the RCE chief in the face?"

"Awww," Amos said. "Warms my heart how well you know me."

"They got her, buddy," Alex said, his voice firm but gentle. "Don't do anything that makes it worse."

"Yeah, yeah."

"You just watch the captain's back down there," Alex continued. "I'll take care of our XO."

"If they hurt her?"

"Then it'll be rainin' RCE parts down on Ilus for a year."

"Won't actually help," Amos said with a sigh.

"No," Alex agreed. "No, it won't. It'll happen, though."

"All right. Gonna go find the captain. Amos out."

Alex tapped on his controls, and the view swung around away from the planet. For a moment, there was nothing, and then a tiny flicker of light, no more than a single pixel. The view zoomed in until it became a massive ship painted with the RCE colors. After a moment, it zoomed again, the rear of the ship swelling until it filled the screen, a small red crosshair glowing in the center of the view.

"Got my eyes on you," Alex said under his breath.

“What’s that?” Basia asked, pointing at the crosshair.

“That’s where the reactor sits. The *Roci*’s got a lock on that location. I can send a gauss round right through her heart faster than her first alarm bell can ring.”

“Won’t that... you know...” He made an explosive motion with his hands.

“No, it’ll just vent. Probably kill a lot of their engineering staff.”

“Do they know you’re aiming at them?”

“Not yet, but I’m about to fill ’em in. That’s what’ll keep my XO breathin’.”

“Nice that you can do something to protect her,” Basia said, and meant to stop, but the words pressed out past his teeth. “My daughter is on the *Barbapiccola*. My wife and son are down on *Ilus*. I can’t do anything to help them or protect them.”

Basia waited for the empty words of reassurance.

“Yeah,” Alex said. “You really fucked that one up, didn’t you?”

Alex tapped something on his screen, and the words RAIL GUN ARMED glowed red for a second over the image of the *Edward Israel*.

“I need to call over to that ship in a sec,” Alex said.

“Warn them.”

“More like threaten them,” Alex said. “Pretty much the shittiest thing we have to offer for someone we all love, but it’s what we got left.” He reached out and fiddled with something on the bulkhead and a stream of cool air shot out of the vent. It ruffled the pilot’s thinning black hair and dried the sweat accumulating on his scalp. He closed his eyes and sighed.

“I don’t even have threats,” Basia said. It sounded like whining even to him. “I don’t even have that.”

“Yeah. So I flew for the Mars navy for twenty years,” Alex said, his eyes still closed.

“Oh?” Basia said. He wasn’t sure what the correct response was.

“I was married,” Alex continued, moving his head around to let the cool air strike every part of his neck and face. Basia didn’t reply. It had the feeling of a story, not a conversation. Alex would tell it or he wouldn’t.

“Life for a naval spouse is, frankly, pretty shitty,” Alex said after a few moments. “Typical tour on an MCRN boat can go from ninety days to four,

maybe five hundred days. Depending on your MOS and fleet locations.”

“MOS?” Basia asked before he could stop himself.

“Your job. Anyway, while you’re out on a boat, your partner is back home, doin’ whatever they do. Lot of folks do plural marriages, group partnerships, things like that. But I’m a one-woman kind of guy, and I guess she was a one-man kind of woman. So we did it the old-fashioned way.”

Basia nodded, even though Alex couldn’t see him. When they were building new domes Basia had done work that kept him at a surface camp for four or five days straight. His wife’s medical practice wouldn’t have let her travel with him, even if they hadn’t had children. Those were long weeks. Basia tried to imagine stringing ten or twenty of those weeks in a row and failed.

“But that meant she stayed home while I flew,” Alex said after a quiet moment. “She had her own work. Software engineer. Good one, too. So it’s not like she was pinin’ away at home for me. But still, if you love somebody you want to be with ’em, and we loved each other. Faithful to each other, if you can imagine that. My tours were tough on us both. I’d get home and we’d break the bed.”

Alex reached out and turned down the air vent, then spun his chair to face Basia. His broad dark face held a sad smile. “It was a crap situation, but she stuck with me. Through twenty years of me bein’ on ships she stuck with me. And when I was in port things were good. She’d work from home and I’d take a lot of leave, and we’d wake up late and make breakfast together. Work in the garden.”

Alex closed his eyes again, and for a moment Basia thought he might have fallen asleep. “Ever been to Mars?”

“No,” Basia replied. “But my wife has.”

“The newer areas, the ones built after we had some idea of what folks need to feel happy, were built different. No more narrow stone corridors. They built wide corridors with lots of green space down the middle for plants.”

“Like on Ceres,” Basia said. “I’ve been to Ceres.”

“Yeah, that’s right. They do that on Ceres too. Anyway, you could apply for a permit to care for a section of that space. Plant what you wanted. We had a little chunk in the corridor outside our home. My wife planted an herb garden, some flowers, a few hot pepper plants. We’d work in it.”

“Sounds nice,” Basia said.

“Yeah.” Alex nodded, eyes still closed. “I didn’t know it at the time. But it really was. I kinda thought it was a pain in the ass, to be honest. Never been much for gardening. But she liked it and I liked her and back then that was enough.”

“Did she die?” Basia asked.

“What? Goodness, no.”

“So what happened?”

“What happened is that she waited twenty years for me to retire. And I did, and then we didn’t have to spend time apart anymore. She went to part-time with her work, I took a part-time gig flying suborbital shuttles. We spent a lot of time in bed.”

Alex opened his eyes and winked. He seemed to be waiting for a response, so Basia said, “And then?”

“And then one day I put into port at the Mariner orbital transit, and while they were unloadin’ my cargo I almost walked into an MCRN recruiting office and signed up again.”

“Do they take—”

“No, I didn’t do it, and yeah, I was too damn old anyway. But when I landed we had a big fight over something stupid. I don’t even remember what. Hell, I didn’t know what we were fightin’ about even at the time, except I sorta did.”

“Leaving.”

“No, actually, it was never about leavin’ her. I never stopped wanting to be with her. But I needed to fly. She’d waited twenty years for me, and she’d done it thinkin’ we’d have all the time in the world after I was through. She’d done her tour, just as much as I had, and she deserved the part that came after.”

Basia felt what was coming like a punch in the stomach, unable to avoid comparing it to his own situation. “But you left anyway.”

Alex didn’t reply for a time, didn’t move, just floated in the straps of his pilot’s chair like a corpse in water. When he spoke again, his voice was strained and quiet, like a man admitting something shameful. Hoping no one will hear.

“One day I left work at the transit office and I walked across the street to the Pur’n’Kleen Water Company and I signed a five-year contract to fly

long-haul freighters out to Saturn and back. That's who I am. I'm not a gardener, or a shuttle pilot, or—turns out—a husband. I'm a long-flight pilot. Pushing a little bubble of air-filled metal across an ocean of nothing is what I was born to do.”

“You can't blame yourself for what happened,” Basia started.

“No,” Alex said, a deep frown cutting into his forehead. “A person can fail the people they love just by being who they are. I'm who I am, and it wasn't what my wife wanted me to be, and somethin' had to break. You decided to do what you did down on that planet, and it put you up here with me instead of with your family.”

Alex leaned forward, grabbing Basia's hands in his own. “It's still on *you*. I will never live down not being the person my wife needed after she spent twenty years waitin' for me. I can never make that right. Don't go feelin' sorry for yourself. You fucked up. You failed the people you love. They're payin' the price for it *right now* and you demean them every second you don't own that shit.”

Basia recoiled as if from a slap to the face. He bounced off the chair and back into the straps. A fly caught in a spider's web. He had to stop himself from ripping at the straps to get free. When he'd stopped struggling, he said, “Then what?”

“Shit,” Alex said, leaning back. “I barely figured out my own mess. Don't ask me to figure out yours.”

“What was her name?” Basia asked.

“Talissa,” Alex said. “Her name *is* Talissa. Even just sayin' it makes me feel like ten kilos of manure in a five-kilo sack.”

“Talissa,” Basia repeated.

“But I can tell you this. I'll never let someone I care about down again. Never again. Not if I can help it. Speakin' of which, I need to make a call,” he said with a bright, frightening smile.

Chapter Twenty-Six: Havelock

It was hard to say exactly what changed on the *Edward Israel* after they captured the saboteur, but Havelock felt it in the commissary and the gym, at his desk as he worked, and in the hallways as he passed by the crew members and RCE staff. Part of it was fear that someone had taken action directly against the ship, part of it was excitement that after months of floating and frustration, something—*anything*—had happened that wasn't at ground level. But more than that, it felt to him like the mood of the ship had clarified. They were the *Edward Israel*, the rightful explorers of New Terra, and everyone was against them. Even the UN mediators couldn't be trusted. And so, strangely, they were free.

The remaining crew of the *Rocinante* wasn't doing anything to change their opinions.

"If you try to break orbit," the man on the screen said, "your ship will be disabled."

His name was Alex Kamal, and he was the acting captain of the *Rocinante*. If RCE's intelligence was accurate, he was also the only remaining crew member of the corvette, and had the one remaining squatter terrorist on the ship with him awaiting transport back to Earth for trial. Havelock crossed his arms and shook his head as the list of threats went on.

"If we find that any harm has come to Naomi Nagata, your ship will be disabled. If she is subjected to torture, your ship will be disabled. If she is killed, your ship will be destroyed."

"Well, ain't that just ducky," Captain Marwick said. "You recall we were talking about *not* having people want to kill my ship?"

"It's just talk," Havelock said as Kamal went on.

“We have already sent our petition to the United Nations and Royal Charter Energy demanding Naomi Nagata’s immediate and unconditional release. Until that petition is answered and she is back on the *Rocinante*, the *Edward Israel* and all RCE personnel and employees are advised to do everything in their power to avoid any further escalation of this situation. This message serves as final verbal notification before the actions I’ve outlined are taken. A copy of this message is being included in the packet to the UN and RCE’s corporate headquarters. Thank you.”

The round-faced, balding man looked into the camera for a moment, then away, and then back before the recording ended. Marwick sighed.

“Not the most professional production,” he said, “but made his points effectively enough, I’d say.”

“Sneeze, and he shoots us,” Havelock said. “Look like we’re going to sneeze, and he shoots us. Make sure his chief engineer doesn’t catch cold, or he shoots us. Give her a blankie at night and a cup of warm milk, or he shoots us.”

“Did have a certain sameness to his thinking, didn’t he?” Marwick said.

Havelock looked around the cabin. The captain’s rooms were smaller than the security station, but he’d placed steel mirrors at the sides and along the tops of the walls to make it feel big. It was an illusion, of course, but it was the kind of illusion that could make the difference between sanity and madness over the course of a few years in confined spaces. The screen set into the wall hiccupped and shifted to a starscape. Not the real one outside, but the one from Sol. Seeing the old constellations was disconcerting.

“Who’s seen this?” Havelock asked.

“Sent to me and Murtry,” Marwick said. “Don’t know who Murtry’s shown it to, but I’ve run it past you.”

“All right,” Havelock said. “What do you want me to do about it?”

“Want? I want you to pop the lady free and set her back home with a stern talking-to,” Marwick said. “After that, I want to get my ship back under thrust and go the hell home the way my contract said. What I expect is that you find out whether this is really all talk, or if my ship’s going to come under fire.”

“They have the firepower.”

“I’m deeply aware of that. But do they have the will and expertise to use it? I’m only asking because the lives of my crew are in threat here, and it’s

making me a bit nervous.”

“I understand,” Havelock said.

“Do you, now?”

“I do. And I’ll find out what I can. But in the meantime, let’s start by assuming that he means it.”

“Yeah,” Marwick said, running a hand through his hair. He sighed. “When I signed up for this, I was thinking it was a hell of an adventure. First alien world. No stations or relief ships if things went pear-shaped. A whole new system full to the top with Christ only knows what. And instead, I get this shite.”

“Right there with you, sir,” Havelock said.

Havelock’s paintball militia, emboldened by the capture, had pressed for immediate action. They had the emergency airlock. The orbital mechanics of the *Rocinante* had clearly brought it close enough for a transit. Go now, they’d said, take the *Rocinante* when they weren’t expecting it, and get the whole charade over with. Havelock had been tempted. If he hadn’t seen what point defense cannons could do to a human body, he might have given the go-ahead.

Instead, they’d pulled power on the prisoner’s suit and hauled her back to the *Israel* before she suffocated. Since then, she’d been in the drunk-tank cell in Havelock’s office. With the security team down to less than a skeleton crew, he’d given the prisoner access to the privacy controls. He didn’t have enough women left on the team to put one on guard duty full-time.

In fact, when he got back to his office, the place was empty except for Nagata in her cell. She looked over, greeting him with a little chin-lift. She wore a red paper jumpsuit and her hair floated around her head in a dark starburst. Enemy capture protocol didn’t allow her hairband, a hand terminal, or her own clothes. She’d been in the cell for the better part of two days. Havelock knew from training exercises that he’d have been half crazed with claustrophobia by now. She’d gone from looking embarrassed to retreating into her own thoughts. It was a Belter thing, he assumed. A few generations living and dying without a sky, and enclosed spaces lost the atavistic terror of premature burial.

He sloped across the room to her.

“Nagata,” he said. “I had some questions for you.”

“Don’t I have the right to an attorney or union representative?” she asked, her voice making it clear that she was at least half joking.

“You do,” Havelock said. “But I was hoping you’d help me out of your kind and generous spirit.”

Her laugh was sharp, short, and insincere. He pulled up the video file on his hand terminal and set it floating just outside the steel mesh of the cell door.

“My name is Alex Kamal, and I am acting captain of the *Rocinante*. In light of recent events—”

Havelock shifted back to his desk, strapping himself in at the couch from force of habit more than anything. He watched Naomi’s face without actually staring at her. The woman had a great poker face. It was hard to tell whether she felt anything at all as she watched her shipmate of years threaten them all on her behalf. When the file ended, he reached out and pulled the hand terminal back to himself.

“Don’t see what you need me for,” she said. “He used small words.”

“You’re hilarious. The question I have is this: Are you really going to let your shipmates turn themselves into criminals and murderers so that you can postpone answering for your crimes?”

Her smile could have meant anything, but he had the sense he’d touched on something. Or close to it. “I feel like you’re asking me for something, friend. But I don’t know quite what it is.”

“Will you tell the *Rocinante* to back off?” Havelock said. “It won’t do you any damage. It’s not like we’re letting you go regardless. And if you cooperate, that’ll speak well for you when we get back to Earth.”

“I can, but it won’t matter. You haven’t shipped with those men. When you listen to that, you hear a list of threats, right?”

“What do you hear?”

“Alex saying how it is,” Naomi said. “All that stuff he told you? Those are just axioms now.”

“I’m sorry to hear you say that,” Havelock said. “Still, if you’ll record something for him assuring him that you’re in good condition and aren’t being mistreated, it’ll only help.”

She shifted, the microcurrents of air and the constant drift of microgravity bringing her back against the cell’s far wall. She touched it gently, steadying herself.

“Alex isn’t the problem,” she said. “Let me tell you a little about Jim Holden.”

“All right,” Havelock said.

“He’s a good man, but he doesn’t turn on a dime. Right now, there’s a debate going on in his head. On the one hand, he was sent out here to make peace, and he wants to do that. On the other hand, he protects his own.”

“His woman?”

“His crew,” Naomi said, biting the words a little. “It’s going to take him a while to decide to stop doing what he agreed to do and just tip over the table.”

Havelock’s hand terminal chimed. It was a reminder to review the next week’s schedules. Even in the depths of crises, minor office tasks demanded their tribute. He pulled up the scheduling grid.

“You think he will, though,” Havelock said.

“He’s got Amos with him,” Naomi said, as if that explained everything. “And then they’ll assault the ship and get me out.”

Havelock laughed. “We’re stretched a little thin, but I don’t see how they can expect to get through to you.”

“You’re talking about the man who got a load of people off Ganymede when it was still a war zone,” Naomi said. “And went onto the alien station at Medina by himself. And scuttled the *Agatha King* by himself when it had two thousand protomolecule zombies on it. He fought his way off Eros in the first outbreak.”

“Rushing in where angels fear to tread,” Havelock said.

“And making it through. I can’t tell you how many last goodbyes I’ve had with him, and he always comes back.”

“Sounds like a rough guy to have for a boyfriend,” Havelock said.

“He is, actually,” she said with a laugh. “But he’s worth it.”

“Why?”

“Because he does what he says he’s going to do,” she said. “And if he says he’s going to pop me out of this cell, then either that will happen, or he’ll die.”

Her expression was calm, her tone matter-of-fact. She wasn’t boasting. If anything, he thought there was a hint of apprehension in her voice. It disturbed him more than the acting captain’s list of threats.

He closed the scheduling grid, considered his hand terminal for a few

seconds. It would be afternoon on the surface, a little over halfway through one of the long, fifteen-hour days.

"Excuse me," he said to the prisoner. "I've got to make a call."

He thumbed the privacy controls down, and the steel mesh of the cage deformed into a pearly opacity. He requested a connection to Murtry, and a few seconds later his boss appeared on the screen. The sun had darkened his skin, and a tiny scab on his forehead looked almost like a caste mark. He nodded to Havelock.

"What can I do for you?" Murtry said.

"I wanted to touch base with you about the prisoner," Havelock said. "Check our strategy."

"Saw the pilot's little tantrum, did you?"

"You know, boss, all that you said before about how they have the biggest guns and if they want to take us down, they can? Because that's still true."

In the background of the feed a door slammed, and Murtry looked up, nodded, and refocused on Havelock. "Less an issue now than ever. As long as one of theirs is on the ship, they won't shoot."

"Won't?"

"Will be less likely to," Murtry amended.

"And what's the plan when RCE orders us to release her?" Havelock said. "It might be worth cutting her loose early. Get out in front of it, get some goodwill back."

"We're way past goodwill."

"I'm just not sure we have the authority to hold her, and if—"

"Are you in her brig?"

Havelock blinked. "Sorry?"

"Are *you* in *her* brig?"

"No, sir."

"Right. She's in yours. You have the jail and you have the pistol, that makes you the sheriff," Murtry said. "If the home office doesn't like what we're doing, we'll appeal the decisions. If we lose the appeal, they can send someone out and have a meeting face-to-face. By that time, all this will look so different they might as well not try. And the home office knows that, Havelock. What we've got here is a very free hand."

"Yeah. All right. I just wanted to check."

“My door’s always open,” Murtry said in a voice that meant maybe Havelock shouldn’t bother him with any more stupid ideas. The connection dropped, and Havelock considered the default screen for a few seconds before he pulled the grid back up. A few seconds later, he deactivated the privacy shield. Naomi was floating in the cage, pushing herself from side to side like a bored kid.

“Your privacy equipment sucks,” she said.

“Really?”

“Really.”

“You heard that, then?”

“ ‘A very free hand,’ ” she said.

“Sorry. That was supposed to be between me and him.”

“I know, but it came right through. Honestly, can you hear me peeing in here?”

“Just that the vacuum comes on,” Havelock said, feeling a little blush in his neck and a sharp embarrassment at being embarrassed. “It’s pretty loud.”

“Old ships,” she said.

He went back to the business of running his staff. A report came in complaining of theft from one of the ship technician’s personal lockers. He routed it to the woman on duty. As long as things stayed pretty calm and the crew was all focused on the dangers outside, he could hold the place together. Having a common enemy actually helped with that. A lot of common enemies. Naomi started humming to herself, a soft melody that hovered just on the edge of recognizable. Havelock let himself enjoy it a little. It was that or be annoyed.

“He wasn’t the only one,” he said.

“Sorry?” Naomi said.

“He wasn’t the only one who got off Eros during the outbreak. My old partner was there. He got off too. Then he went back later. When it hit Venus.”

“Wait. You knew *Miller*?”

“Yeah,” Havelock said.

“Small universe.”

“He was one of maybe six decent people working Ceres Station when Star Helix had the contract. Warned me to quit Protogen before they

imploded too. I was sorry about it when he died.”

“He’ll be flattered,” she said.

“We’re not the bad guys here. RCE didn’t start any of this. You said you liked Holden because he always does what he says he’ll do? That’s us. RCE are the ones who asked permission and made a plan and came out here to do what everyone agreed we should do.”

“Not the people in First Landing. They didn’t agree.”

“No, because they were breaking the rules that we were following. I’m just... I know how weird and dangerous this all is, but before your friends start blasting rail gun rounds through our reactor, I want you to see that we’re not the bad guys here.”

His voice had gotten thinner and higher as he spoke. At the end, he was almost shouting. He pressed his hands together. Bit his lips.

“Under a little pressure,” she said.

“Some,” he agreed.

“Let me out, I’ll put in a good word for you,” she said. “And it’ll keep Holden from doing anything stupid.”

“Really?”

“It’ll keep him from doing a couple particular stupid things,” she said. “He may come up with something else. He’s clever that way.”

“I can’t,” he said.

“I know.”

The ship passed invisibly into the planet’s shadow, the decks clicking and groaning as the expansion plates adjusted to the change in radiant heat. Havelock felt a little rush of shame. She was his prisoner. He was the jailer. He shouldn’t need her approval. If she thought he and his people were baby-killing fascist power freaks, it didn’t change anything he had to do. Naomi went back to humming. It was a different song now. Something slow, in a minor key. After a while, she let it drift into silence.

“They weren’t the only ones,” she said as he finished the week’s duty roster. “They were the only ones that were trapped in the outbreak, but the place was locked down before that. A bunch of thugs in stolen riot armor making sure everyone did what they were told, and shooting the ones who didn’t. Getting ready for it. A few people made it past them.”

“Really? Who?”

Naomi shrugged.

“Me,” she said.

Chapter Twenty-Seven: Elvi

Elvi sat on the crest of the hill, looking west. The morning light behind her caught the wings of thousands of butterfly-like animals. She hadn't seen them before, but today they filled the air from the ground to twenty meters high. A vast school of tiny animals. Or insects. Or whatever other name humanity eventually assigned to this foreign kingdom of life. For her, right now, they were butterflies.

They moved together like a school of fish, independent and coherent. Bursts of color—blue and silver and crimson and green—flashed through them, seeming almost to come in patterns for a moment and then dissolving into chaos. The column of them rose, narrowing, then broadened and flattened. They moved past her in a rush, and for a few seconds she was inside the cluster, palm-sized wings fluttering gently against her with a sound like sheets of paper falling and a clean, astringent smell like mint without being mint. She smiled and raised her arms up into the cloud of them, taking joy in the beauty and the moment, and then they passed, and she turned to watch them flow through the air, tumbling to the south as if they were going somewhere in particular.

She stood and stretched, adjusting her collection satchel against her hip. The sunlight pressed against her shoulders and the nape of her neck as she walked forward into the dusty, stone-paved field. The ruins rose to the north, with First Landing not even a smudge next to them, all human artifacts hidden by the curve of the planet and the shape of the hills. All except her.

Here and there, a few butterflies remained, possibly dead. Possibly quiescent. She squatted beside one, looking into the vibrant blue of its

wings, the coppery complication of flesh where its body—what she thought of as its body—folded together, interarticulated like a hinge. She put on her gloves and lifted the tiny body. It didn't so much as flutter. Even though it meant getting less physiological data, she hoped it was already dead.

"Sorry, little one," she said, just in case. "It's in the name of science."

She folded it into the black lattice, sealed it, and triggered the collection sequence. The array of sampling needles clicked and muttered to themselves. Elvi squinted up into the white-blue arch of the sky. The red dot floated about fifteen degrees above the horizon, bright enough to show through the thin, greenish clouds.

The satchel coughed, throwing out an error code Elvi hadn't seen before. She took out her hand terminal, connecting it to the satchel's output channel. The preliminary dataset was a mess. Elvi felt a deep, cold stab of fear. If the satchel was broken, it could take days before the one functioning shuttle could bring her a spare from the *Israel*. She wasn't even positive they had a spare in the toolkit or if they'd all been lost in the wreck of the heavy shuttle. The prospect of years going by collecting data by hand and spending her nights doing dissections like she was back in lower university reared up like a ghost. She took the butterfly out. Its corpse looked almost the same as when she'd put it in. She sat cross-legged beside it and ran the satchel's system diagnostics, chewing her lips as she waited for a fresh error code.

The readout came up clean. She looked from the satchel to the butterfly, then back again. A second hypothesis formed, as chilling as the first. Maybe worse. She picked up the dead butterfly and marched back toward the huts. Fayez's was a small green geodesic design he'd constructed halfway down a thin hill, high enough that any storm runoff would pass it by, but not at the crest where the wind would catch it. He was sitting on a stool, leaning back against the hut. He was wearing a pair of polyfiber work pants, a T-shirt, and an open bathrobe. He hadn't shaved in days, and the stubble on his cheeks made him look older.

"This isn't an animal," she said, holding out the butterfly.

He let the stool come down, its legs tapping the ground. "Good to see you too," he said.

"This isn't two biomes coming together. It's three. This... whatever it is? It doesn't have any of the chemical or structural commonalities that

you'd expect to see."

"Lucia Merton was up looking for you. Did you run across her?"

"What? No. Look, this is another machine. It's another thing like"—she pointed at the low red moon—"like *that*."

"All right."

"What if they're really not coming awake just because we're here? What if they're consistent? It complicates everything."

Fayez scratched his scalp just above his left ear. "You seem to want something here, Elvi, but I don't know what it is."

"How am I supposed to make any sense of this place when it keeps changing all the rules?" she said, and her voice sounded shrill even to her. She threw the butterfly down angrily, then immediately wished she hadn't. Not that it cared, just that the gesture seemed cruel. Fayez smiled his sharp little smile.

"You're preaching to the choir. You know what I've been doing all morning?"

"Drinking?"

"I wish. I've been going over surface data from the *Israel*. There's a chain of islands on the far side of the planet with what looks like a metric ass-ton of volcanic activity. Only so far as I can tell, this planet doesn't have, you know, tectonic plates. So what the hell is mimicking vulcanism? Do you know what Michaela's working on?"

"No."

"There's a pattern in the ultraviolet light that reaches the ground here, like it's some kind of carrier signal. Doesn't exist before the sunlight hits the exosphere, and by the time it comes here, complex, consistent patterning. She's got no idea where it's coming from. Sudyam's workgroup has what they think might be complex molecules that incorporate stable transuranics."

"How does that work?"

"I know, right?" Fayez said.

Elvi hung her hand on her shoulder, letting her elbow hang loose. Sweat trickled down her spine.

"I have to—"

"—tell Holden," Fayez said. "I know."

"I was going to say 'review my data.' See if maybe there's a common

structure between that”—she nodded at the butterfly—“and the big thing in the desert. Maybe I can make sense of it.”

“If you can’t, no one can,” Fayez said.

Something in his voice caught her attention, and she looked at him more closely. His fox-sharp face looked softer around the eyes and jowls. The flesh around his eyes was puffier than usual. “Are you all right?”

He laughed and spread his arms toward the horizon, gesturing at the whole planet—the whole universe—at once. “I’m great. Just spiffy. Thanks for asking.”

“I’m sorry. I just—”

“Don’t, Elvi,” he said. “Don’t be sorry. Just go on dealing with all of this the way that you do. Pile on another few layers of not thinking about it, and sail on, my dear, sail on. Whatever keeps you sane and functioning in a place like this, I will carry a flag for it. I’ll even pray with Simon on Sunday mornings. That’s how bad I’ve got it. Whatever works for you has my blessings.”

“Thank you?”

“Afwan,” he said, waving his hand. “Only before you bury your head back in your datasets again? Go see Doctor Merton. She looked worried.”

The boy sitting on the clinic table was six years old. His skin was the same deep brown as Elvi’s own, but with an ashy color to it. Not dryness, but something deeper. His eyes were bloodshot like he’d been weeping. Maybe he had been. His mother stood in the corner, her arms crossed and a vicious scowl on her lips. Lucia’s voice was crisp and calm, but her shoulders rode high up beside her ears.

“So I’m seeing this here,” she said, as her finger pulled down on the boy’s cheek, opening a thin gap between the lower lid and the roughened surface of the eyeball. The discoloration was almost invisible in the redness, but it was there. The faintest hint of green.

“I see,” Elvi said. She smiled at the boy. He didn’t smile back. “So, Jacob—”

“Jason.”

“Sorry. Jason. How long have you had trouble seeing things?”

The boy shrugged. "Right after my eyes started hurting again."

"And everything looks... green?"

He nodded. Lucia touched Elvi's arm. Silently, the doctor shone a light into the boy's eye. The iris barely reacted, and Elvi caught a glimpse of something in the fluid behind the boy's cornea, like a badly maintained aquarium. She nodded.

Lucia stood up, smiling at the woman. "If you'll wait with him here, Amanda. I'll be right back."

Amanda nodded once, sharply. Elvi let Lucia draw her through the examining room door and down a short hallway. Outside, a stiff breeze had picked up, rattling the clinic's doors and windows.

"He's the only one I've seen like this," Lucia said. "There's nothing in the literature."

"His mother doesn't seem to like me very much," Elvi said, trying to make it a joke.

"Her wife was shot and killed by RCE security," Lucia said.

"Oh. I'm sorry."

The testing array was good, but it was old. Ten years, maybe fifteen. A long scar ran across the bottom of its screen where something had gouged at it. Elvi could believe it had made the long trek from war-torn Ganymede to come here. She was surprised it still worked, but when Lucia thumbed in her access code, the screen came to life. The sample was beautiful in its way. A branching of elegant green like a pictogram meaning *tree*.

"It began in the extracellular matrix," Lucia said. "Low-level inflammation, but nothing worse than that. I hoped it would clear up on its own."

"Only now it's in the vitreous humor," Elvi said.

"I was wondering..." Lucia began, but Elvi had already taken out her hand terminal and started syncing it to the array. It only took a few seconds to find a match. Elvi tapped through the data.

"All right," she said. "The closest match is some of the rainwater organisms." Lucia shook her head, and Elvi pointed up. "You know how the clouds are greenish? There's a whole biome of organisms up there that have found ways to exploit the moisture and high ultraviolet exposure."

"Like plants? Fungi?"

"*Like* them," Elvi said. "It's not where we've been burning most of our

cycles. But it looks like a pretty crowded niche. A lot of species fighting for resources. I'm guessing this little fella was in a raindrop that dropped into Jason's eye and found a way to live there."

"He's had several eye infections, but they all came from familiar organisms. This thing. Is it contagious, do you think?"

"I wouldn't guess so," Elvi said. "We're just as new to it as it is to us. It evolved to spread in open air through a water cycle. It's salt tolerant if it's living in us, and that's interesting. If his eyes were already compromised, he may have been vulnerable to it, but unless he starts throwing his tears at people, wouldn't think it would go too far."

"What about his eyesight?"

Elvi straightened up. Lucia looked at her seriously, almost angrily. Elvi knew it wasn't directed at her, but at the terrible ignorance they were both struggling under. "I don't know. We knew something like this was bound to happen sooner or later, but I don't know what we can do about it. Except tell people not to go out when it's raining."

"That isn't going to help him," Lucia said. "Can you ask the labs back home for help?"

A hundred objections filled Elvi's mind. *I don't control the RCE research teams and All the data analysis is planned out and running months ahead of where we are now and I just got another sample of a third biome this morning.* She tapped at her hand terminal, saving a copy of the array's data, then translating it into RCE's favored formats and sending it winging through the air back to the *Israel*, and then the Ring, and then Earth.

"I'll try," she said. "In the meantime, though, we need to let people know it's a problem. Has Carol Chiwewe heard about this?"

"She knows I'm suspicious and that I wanted to bring you in on it," Lucia said.

Elvi nodded, already trying to think what the best way would be to bring the issue to Murtry's attention. "Well, you let your side know, and I'll tell mine."

"All right," Lucia said. And then a moment later, "I hate that it breaks down that way. Your side and mine. One of my teachers back in school always used to say that contagion was the one absolute proof of community. People could pretend there weren't drug users and prostitutes and unvaccinated children all they wanted, but when the plague came through,

all that mattered was who was actually breathing your air.”

“I’m not sure if that’s reassuring or awful.”

“There’s room for both,” Lucia said. “This scares me as much as anything that’s happened. This little... thing. What if we can’t fix it?”

“We probably can,” Elvi said. “And then we’ll fix the next one. And the one after that. It’s tricky and it’s hard, but everything’s going to be all right.”

Lucia lifted an eyebrow. “You really believe that?”

“Sure. Why not?”

“You aren’t scared at all?”

Elvi paused, thinking about the question. “If I am, I don’t feel it,” she said. “It’s not something I think about.”

“Take what blessings you can, I suppose. What about the third side?”

Elvi didn’t know what Lucia was talking about, and then she heard Favez’s mocking voice in her memory and her heart leaped. She hated it a little that her heart leaped, but that didn’t stop her.

“I’ll tell him,” she said. “I’ll tell Holden.”

In the commissary, Holden sat hunched over his hand terminal. He’d shaved and his hair was combed. His shirt was pressed. *Cleans up pretty*, a voice in the back of her mind said, and she pushed it away.

A woman’s voice came from the terminal, crackling and sharp. “—squeeze all the balls I can get my hands around until someone starts crying, but it will take time. And I know you’re thinking of taking this public, because you’re fucking stupid, and that is what you always think of. You and publicity are like a sixteen-year-old boy and boobs. Nothing else in your head. So before you even begin—”

Amos lumbered up from the side. His smile was as open and friendly as ever, but Elvi thought there might be a little edge to it. His broad, bald head always made her think of babies, and she had to restrain herself from patting it.

“Hey,” Amos said. “Sorry, but the captain’s a little busy.”

“Who’s he listening to?”

“United Nations,” Amos said. “He’s been trying to get your boss to let our XO out.”

“Not my boss,” Elvi said. “Murtry’s security. It’s a whole different organizational structure.”

“That corporate stuff’s not my strong suit,” he said.

“I just needed to...” she began, and Holden drew himself up, looking into the hand terminal camera. His lips formed a hard little smile, and she lost her train of thought.

“Let me make it clear,” Holden said, his voice low and solid as stone, “that this was done on my orders. If Royal Charter wants to put me on trial when I get back because I ordered my crew to disable their illegally weaponized shuttle I would be happy to—”

“Doc?” Amos said.

“What? Sorry. No, it’s just that there are some things going on that I thought he needed to know about.”

Amos shook his head in something that almost passed for sorrow. “No. Nothing’s happening until the XO’s clear.”

“No, it is, though,” Elvi said. “Not just one thing either. I found more artifacts waking up today. Some of them are passing for local animals, I think. If we’d been here long enough to build a catalog, we could tell which were which, but as it is, everything looks new. So we don’t know.”

“So some of the lizards are protomolecule stuff?” Amos asked.

“Yes. Maybe. We don’t know yet. And there’s more, because the local biome is starting to find ways to invade us. Exploit our resources. And the perimeter dome never got set up, and so all of our microfauna are just wandering around mixing with the local ecosphere and there’s no way to get it back so we’re contaminating everything and everything’s contaminating us.”

She was talking too fast. She hated this. When—if—she ever got back to Earth she was going to take some communications classes. Something that would keep her from rattling on like a can rolling down stairs.

“It’s *all* accelerating,” she said. “And maybe it is a reaction to us or to something we’re doing. Or maybe it’s not. And I know we’re having trouble figuring out the politics and getting along with each other, and I’m really sorry about that.” There were tears in her eyes now. Jesus. What was she? Twelve? “But we have to look at what’s happening, because it’s really, really dangerous and it’s happening right now. And it’s all going to hit a crisis point, and then something really, really bad will happen.”

And then Holden was there, his eyes on her, his voice soothing. She wiped her tears with the back of her hand and wondered whether any of

Jason's invading blindness-fungus had been on her hands when she did it.

"Hey," Holden said. "Are you all right?"

"I am," she said. "I'm fine. I'm sorry."

"It's okay," Holden said. "You said something about a crisis?"

She nodded.

"All right," he said. "What would that look like?"

"I don't know," she said. "I won't know. Not until it's happened."

Chapter Twenty-Eight: Basia

Basia floated above the world.

Seventeen hundred kilometers below, Ilus spun past at a dizzying pace. Alex had told him that the *Rocinante* had an orbital period just under two hours, but Basia couldn't feel it. Floating outside the ship in microgravity, his inner ear told him that he was drifting, motionless. So instead the universe appeared to spin far too quickly, like some giant child's toy. Every hour, moving from dark to light, and then an hour later back to darkness, the sun rising from behind Ilus, spinning around behind him, and setting again briefly. Basia had been outside long enough to see the change three times, the center of his own cosmos.

The planet's one vast ocean was in night. The string of islands that crossed it tiny black spots in a larger darkness. One of the islands, the largest of them, was outlined in a faint green light. Luminescence in the waves crashing against its beaches and cliffs.

The day-side was dominated by Ilus' single massive continent. The southwestern quarter was the enormous desert. First Landing would be just to the north of it. In daylight, it was far too small to see with the naked eye. Even the huge alien towers where he'd met with Coop and Kate and all the others in some previous lifetime were too small to find.

"You okay out there, partner?" Alex's voice said over the radio. "Been driftin' a while now. That hatch ain't gonna fix itself."

As he spoke, the *Edward Israel* passed into the daylight side of the planet and flashed like a tiny white spark. It was almost too far away to be seen, but, in orbital terms, very very close. Alex was holding the *Rocinante* locked in a matching orbit so he could keep his gun pointed at them.

“It’s beautiful,” Basia said, looking back down at the planet spinning by. “When we came in on the *Barb* I never took time to just look at it. But Ilus is beautiful.”

“So,” Alex said, his drawl adding an extra syllable to the word, “remember when we talked about the euphoria you can get on a spacewalk?”

“I’m not new at this,” Basia replied. “I know what the happys are like, and I’m good. The hatch is almost done. Just taking a break.”

They’d eaten all their meals together. Alex had shared his collection of twenty-second-century Noir Revival films with him. Just the night before they’d watched *Naked Comes the Gun*. Basia found noir too bleak, too hopeless to enjoy. It had led to a lengthy conversation over drinks about why Alex thought he was wrong to feel that way.

And, true to Naomi’s promise, Alex had dug up a list of open repair projects for Basia to work on. One of which was a sticky actuator arm on one of the *Rocinante*’s two torpedo loading hatches.

The hatch lay open next to him, a door in the flank of the warship a meter wide and eight meters long. A massive white tube sat just below the opening. One of the ship’s torpedoes. It looked too big to be just a missile. Almost a small spaceship in its own right. It didn’t look dangerous, just well crafted and functional. Basia knew that in its heart lay a warhead that could reduce another spaceship to molten metal and plasma. It was hard to reconcile that with the gentle white curves and sense of calmness and solidity.

The faulty actuator had already been cut out, and floated next to the ship at the end of a magnetic tether, waiting to be taken inside. With an effort, Basia turned away from the stunning view of Ilus and pulled the new actuator off the web harness on his back.

“Going back to work now,” he said to Alex.

“Roger that,” the pilot replied. “Be glad to have that working.”

“Planning to need it?” Basia asked.

“Nope, but I’d like to have the option if it comes up.” Alex laughed. He laughed, but he was also serious.

Basia began attaching the new arm to the hull mounts and the missile hatch. He knew almost nothing about electronics, and had worried that wiring up the new device would be beyond his skills, but it turned out that it

had a single plug that went into a port inside the actuator housing. Which made sense when he thought about it. They would design warships around the idea that damage was inevitable. That repairs would sometimes take place in hostile environments. Making everything as modular and easy to swap out as possible wasn't just sensible, it was a survival trait. He wondered if the Martians had had a Belter on the design team.

"The *Barbapiccola* is on our side of Ilus," Alex said, still in that same lazy, sleepy voice.

"Can you show me?" Basia looked around, but could see nothing but the glowing planet below and the white spark of the *Edward Israel*.

"Hold on." A moment later, a tiny green dot appeared on Basia's heads-up display, drifting slowly.

"It's the dot?"

"Well," Alex said, "it's where the dot *is*. But it's too far away to see right now. Just a sec."

A green square appeared on Basia's HUD, then zoomed in like a telescope until the distant freighter was the size of his thumbnail.

"That's at 50X," Alex said.

"Space is too big," Basia replied.

"It's been said. And this is just the space in low orbit around one planet. Breaks the head a bit to think about."

"I try not to."

"Wise man."

The *Barbapiccola* looked like a big metal shipping container with the squat bell housing of a drive at one end, and the blocky superstructure of command and control on top. She was ugly and utterly functional. A thing of the vacuum that would never know the heat of atmospheric drag.

The large cargo bays that took up most of her interior would be full of the raw lithium ore they'd already pulled off of Ilus. Waiting to fly to the refineries on Pallas Station. Waiting to be traded for food and medicine and soil enrichments. All the things the fledgling colony needed to survive.

Waiting to take his daughter away.

"Can we talk to them?" he asked.

"Huh? The *Barb*? Sure. Why?"

"My daughter is over there."

"Alrighty," came the reply, followed by a burst of static. A few moments

after that, a voice with a thick Belter accent replied.

“Que?”

“Sa bueno. Basia Merton, mé. Suche nach Felcia Merton. Donde?”

“Sa sa,” the voice said, the tone a fight between curiosity and irritation. The connection stayed open but silent.

While he waited, Basia finished mounting the actuator arm and plugged it in. He called down on the ship channel to have Alex test it, and it opened and closed several times without binding or twisting the hatch. The motor made a smooth vibration in the hull beneath his magnetic boots that set his helmet to humming.

“Papa?” came a hesitant voice.

“Baby, Felcia, it’s me, honey,” he replied, trying to keep from babbling like an idiot and mostly failing.

“Papa,” she said, delight coloring her voice. Deeper now, richer, but still the voice of the little girl that had squealed *Papa* when he came home from work. It still melted all the hard, angry, adult places in his heart.

“I’m up here with you, honey.”

“On the *Barbapiccola*?” she said in confusion.

“No, I mean, in orbit. Over Ilus. I can see your ship, honey. Flying by.”

“Let me find a screen! Where are you? I can look for you.”

“No, don’t worry about that. I’m pretty far away. Had to magnify a lot to see you. Just keep talking to me for a minute before you go around the planet again.”

“Okay,” she said. “Are they nice to you over there?”

Basia laughed. “Your brother wanted to know the same thing. They’re fine. The best jailers ever. And you?”

“Everyone is nice, but worried. Maybe the RCE ship won’t let us leave.”

“Everything will be fine, honey,” Basia said, patting at the empty space as if she could see him and take comfort from it. “Holden’s working it out.”

“He made you a prisoner, Papa.”

“He did me a favor, Felcia. He saved me,” Basia said, and realized it was true as he said it. Murtry would have killed him. And his son and wife were still down on the planet. “I just wanted to say hello. Not talk about that stuff.”

“So hello, Papa,” she replied with her grown-up little girl’s voice.

“Hello, podling,” he replied, calling her by a nickname he hadn’t used in

years.

She made a strange noise, and it took Basia a moment to realize she was crying. “Never going to see you again, Papa,” she said, her voice thick.

He started to reply with objections, with reassurances. But his conversation with Alex came back to him, and instead he said, “Maybe, podling. That’s nobody’s fault but mine. Remember that, okay? I tried to do what I thought was right, but I messed up and it’s on no one but me if I have to pay for it.”

“I don’t like that,” Felcia said, still crying.

Me either, honey, he thought, but said, “Is what is, sa sa? Is what is. Doesn’t change that I love you, and your mama, and Jacek.” *And Katoa, who I left to die.*

“They say I have to go,” Felcia said. The tiny green dot that hid the massive spaceship his daughter lived on was moving away, toward the horizon, into radio blackout. He could see it happening. Watch the unimaginable distance between them getting wider until a planet came between them.

“Okay, honey,” he said. “Bye now. I love you.”

Whatever she might have said in reply was lost, as the *Barbapiccola* slipped behind Ilus and the channel broke up into static and died. No relay satellites in orbit around the new world yet. Back to line of sight, like nineteenth-century primitives bouncing radio around inside their atmosphere. Basia thought of his home, really just a shack in a tiny village with two dusty roads. Maybe that was appropriate.

Seventeen hundred kilometers below, his world spun. Beneath his feet, a spaceship capable of flying across the solar system hummed to itself with barely restrained power.

Maybe not *just* like a nineteenth-century primitive.

“You ready to come back in?” Alex said, breaking into his reverie.

“In a minute,” Basia replied. “Can you find First Landing and point it out?”

“Sure. It’s moving away, but you can still see it.”

Another tiny green dot appeared on his HUD over a spot just north of Ilus’ great southern desert. Knowing where to look, Basia thought he could detect the open bowl of the mining operations north of the village, but that might just have been wishful thinking.

Lucia would be down there, seeing patients, looking after Jacek. It was daylight in the village, so Lucia would definitely still be working. Basia tried to imagine what she was doing at that moment. The temptation to have Alex call down to the village so he could talk to her was almost overpowering. But he'd been selfish enough already, calling Felcia. He was a source of pain to his family now. The only comfort to be had came at their expense.

So instead he began packing up his tools and the damaged actuator.

If he never came back, would Lucia find someone else? He tried to tell himself that he was the sort of man who'd want that for her. That her happiness was more important than his fears about losing her. He tried the idea on like a new outfit. Seeing if he could find a way to make it fit.

It didn't. He saw with clarity as perfect as if Alex were zooming his HUD in on the idea that he was *not* that sort of man. It was hard to tell if that was a flattering testament to his commitment to his marriage, or a scathing commentary on his own insecurities and selfishness. Like almost everything else that had happened to him over the last months, it was murky and difficult to navigate.

He would go back with Holden, probably to the UN complex on Luna. The OPA would claim he was their citizen, but Ganymede had originally been a UN colony. The legality of which people were citizens of which government was still being worked out, and would be for decades. Plenty of time to try him as a UN citizen for crimes against a UN-based company and throw him in prison for all eternity.

Years of trials, probably.

Basia began slowly walking across the hull of the *Rocinante*, dragging his webbed-together bundle of tools and spare parts behind. At the stern of the ship he stopped and planted both feet, waiting for the bundle to float past him and stop at the end of its line. The weight pulled his arms out painfully for a moment as he killed its momentum.

"Open the cargo bay hatch," he said.

"Roger," Alex replied, and the ship started to vibrate under Basia's feet. The two heavy doors of the cargo bay slowly slid open. When they were about halfway, he yanked down on the line and the bundle of tools swung around the edge of the ship and into the cargo bay. He let go of the line and let them sail inside without yanking him off the edge after them.

In the corner of his vision, there was a bright burst of light, like the flash of a distant camera. Basia turned to look, expecting to see one of the other two ships moving into the sunlight. Instead, there was a growing point of white light centered over Ilus' largest island. It was bright enough to overpower the faint green luminescence of its beaches, and rapidly expanding.

In seconds, the dark side of the planet was lit up as brightly as if a second sun had risen. The other islands in the chain suddenly visible in stark black and white, casting long shadows across the ocean as the white spot grew. He felt his heart start to race.

"Alex?" he said.

The ocean around the big island heaved up, bulging out beyond the curve of the planet in what must have been a tsunami miles high. But before Basia could grasp the enormity of the forces involved in such an uprising, it was gone. The island, the massive upwelling of the ocean, the smaller nearby islands, they all disappeared in a column of white fire and a rapidly rising mushroom cloud.

Basia's visor darkened dramatically, and he had a sense that if it hadn't the light coming from the planet below might have blinded him. But even through the welder's shield darkness of the helmet, he could see the column of fire growing, hurling white vapor up until it broke free of the planet's atmosphere and became glittering crystals of ice speeding away from the gravity well like a shower of glass from a bullet-shattered window.

A massive ripple, like wind across a field of grass, sped away from the growing pillar of fire through the surrounding ocean. Intellectually, Basia knew the ripples had to be waves, hundreds or thousands of feet high, rushing away from the blast. But the intellectual part of his brain was rapidly disappearing behind the screaming primitive who was relieving his bladder into the suit's condom catheter in fear.

Basia had grown up in the Jupiter system. He'd seen video of Io up close more than once. Io was famous for having the most massive volcanoes ever seen by man. Gigantic geysers of sulfur blasting out of the surface of the moon until particles were flung into Jupiter's plasma torus and faint ring system. They made Io an almost insanely inhospitable place.

The explosion Basia was looking at from orbit dwarfed those eruptions. It looked like half the planet was being flattened by the force of the blast.

His initial thought was that it was a very good thing First Landing was on the other side of the world. His second, that the shock wave was heading that direction, and not even traveling around the planet was going to slow it down much.

“Jesus Christ!” Alex yelled across the radio. “Are you seein’ that shit!”

“Call down,” Basia tried to yell back. It came out as a panicky whimper. “You have to warn them.”

“Warn them to do what?” Alex asked. He sounded dazed.

What do you do when the planet you’re standing on tries to kill you?

Basia didn’t know.

Chapter Twenty-Nine: Holden

Holden stood on a low hill overlooking First Landing trying to enjoy the beauty of the planet while his brain chewed on the half dozen insoluble problems that he was somehow supposed to solve. The usual dust had been tamped down by the recent run of gentle rains. It made the town look clean, well-tended. Peaceful. Above, the sky was a stunning indigo blue with just the faintest streamers of high-altitude clouds breaking it up. His hand terminal was reporting the temperature as 22 degrees Celsius with a gentle four-knot wind coming out of the northeast. The only thing that would have made it better was Naomi there with him, or at least back safe on the *Roci*. But that would have made it a lot better.

I miss planets,” Holden said, closing his eyes and facing the sun.

“I don’t,” Amos replied. He’d been so quiet during their afternoon walk that Holden had sort of forgotten he was there.

“You never miss a breeze? The sun on your skin? A gentle rain?”

“Those are not the parts of planetary life that imprinted on my memory,” Amos replied.

“Want to talk about it?” Holden asked.

“Nope.”

“Okay.” Holden didn’t take the mechanic’s refusal personally. Amos had, as he described it, a lot of past in his past. He didn’t like people digging around there, and Holden was the last person to pry. Holden already knew more about Amos’ brutal upbringing on Earth than he wanted to.

“Better head back, I guess,” Holden said after a few more pleasant moments in the breeze. “Might have an RCE reply to my requests.”

“Yeah.” Amos snorted. “If the RCE bigwigs sent a reply seconds after

receiving your message, they should be arriving just about now.”

“I won’t let your facts about light delay get in the way of my optimism.”

“Not much does.”

Holden was silent for a long moment. He licked his lips.

“If they say no,” he said. “If they’re committed to letting Murtry hold on to her. I’m going to have to make a decision about whether she’s more important than keeping this place from devolving into a shooting war.”

“Yup.”

“I’m pretty sure I know what I’m going to pick too.”

“Yup.”

“There will be people who think I’m very selfish.”

“True,” Amos said. “But also, fuck ’em. They’re not us.”

“That us-and-them thing is the problem at the base of all this—” Holden started, but his hand terminal interrupted, a high-priority alarm sounding. It was the alert reserved for crewperson in danger. *Naomi*, he thought. *Something happened to Naomi.*

Amos took a few steps toward Holden, his brow furrowing and hands clenching into fists. His mind had gone to the same place. If something had actually happened to Naomi, there was no way he’d be able to stop Amos from killing Murtry this time. Probably, he wouldn’t even try.

“Holden here,” he said, trying to keep his voice level.

“Cap, we got a problem,” Alex replied. His voice was shaky, terrified. Holden had flown with Alex through half a dozen battles. Not even when the missile trails filled the sky around them had he ever heard his pilot panic. Whatever it was, it was bad.

“Is she hurt?”

“What? Who? You mean Naomi? Naomi’s fine, far as I know,” Alex replied. “You’re in deep shit, Captain.”

Holden looked around. First Landing looked quiet. A new shift of Belters were boarding the carts that would take them to the mine. A few people walked the streets, going about their business. The two RCE security people on patrol were chatting amiably with a local and sipping some sort of hot drink from a thermos. The only violent thing happening within line of sight was a mimic lizard slowly dragging a stomach-engulfed bird back through its gullet.

“Okay?” Holden said.

“Something blew up on the other side of the planet,” Alex said, talking fast enough to stumble over his words, most of his drawl disappearing. “Absolutely flattened an island chain over there. I mean it’s like someone dropped a rock. Kill-the-dinosaurs kind of thing. Shock wave is heading around the planet right now. You have about six hours. Maybe.”

Amos had traded his angry face in for one of genuine surprise. It wasn’t an expression he wore often, and it made him look vaguely childlike.

“Six hours until what, Alex?” Holden said. “Details, please.”

“Figure two-, three-hundred-kilometer-an-hour winds, lightning, torrential rains. You’re far enough inland to avoid the three-kilometer-high tsunami.”

“Basic wrath of God package, minus drowning,” Holden said, reaching for humor to hide his rising fear. “How certain is this?”

“Uh, Captain? I’m watching the other side of the planet rip itself to shreds right now. This isn’t a prediction. This is thousands of clicks of planet between you and the apocalypse disappearing fast.”

“Got some video to send?”

“Yep,” said the pilot. “Got fresh underwear for after you watch it?”

“Send it anyway. I may need it to convince the locals. Holden out.”

“So, Cap,” Amos said. “What’s the plan?”

“I haven’t got a clue.”

“Run it again,” Murtry said after Holden played the apocalyptic video Alex had shot with the *Rocinante*’s telescopes. Holden, Murtry, and Carol Chiwewe were in the town hall, Holden’s terminal synced up to the big screen hanging on one wall.

Holden obliged and played through the recording a second time. Again, the big island disappeared in a flash of light and a column of fire. Again, the other islands vanished under a massive wall of water and then the spreading clouds of steam and ash. Again, the shock wave raced away from the center of the explosion, dragging massive waves behind it.

As the video played, Murtry talked quietly on his hand terminal with someone. Carol shook her head gently, as though it were possible to deny the evidence playing on-screen.

The video ended, and Murtry said, “This is matching our data. The geoengineering group thinks there was some kind of fission reaction down near the bottom of the ocean.” Holden prickled at the implication he might be lying about something so serious, but held his tongue.

“Like a bomb?” Carol Chiwewe said.

“Or an alien power plant failing out,” Murtry said. “Can’t really speculate.”

“How quickly can we evacuate?” Carol said, her voice surprisingly firm for a person who’d just looked Armageddon in the eye.

“That’s what we’re here to talk about,” Holden said. “What’s our best plan for protecting the colony? Evacuation is one option, but we’re down to a little over five hours now.”

“Evacuation won’t work,” Murtry said, “at least using our shuttle. The window’s too tight. We’d be taking off in the face of that shock wave, with turbulence and atmospheric ionization doing its best to knock us out of the sky. Better to survive down here and still have a shuttle available afterward for relief.”

Holden frowned and nodded. “I hate to admit it, but I agree. Alex says he can’t put the *Roci* down and get it back off the ground before the blast. And if we do try to evacuate, we’ll probably have riots on our hands. How do you tell someone that their kid doesn’t get to leave on the shuttle?”

“Riots won’t be a problem,” Murtry said. The calm of his voice was chilling.

“How do we protect everyone? The entire colony?” Holden said, again choosing to ignore the provocation.

“There’s mines,” Amos said. He hovered over Holden like an anxious parent. He’d started doing that whenever Murtry was around.

“No.” Carol shook her head. “It’s low ground. It’ll flood if we get too much rain.”

“I think we should count on anything that can go wrong doing so,” Holden agreed. “So no pits and caves that can fill up with water. I’m thinking the ruins.”

Murtry leaned back in his chair, frowning. “What makes you think those’ll hold up to three-hundred-kilometer-an-hour winds?”

“Honestly? I have no good reason to believe that,” Holden said. “But they’ve been there a very long time. That’s what I’ve got. Hope that if they

made it this far, they can make it through what's coming."

"Better'n those huts you guys are living in," Amos added with a beefy shrug. "I can kick down any building in this town in ten minutes."

Murtry leaned back even farther in his chair, staring up at the ceiling and making clicking noises with his tongue. After a few seconds he said, "Okay. That's as good a plan as any I have. We just need to outlive that initial shock wave. What comes after will be bad, but we'll be able to take any survivors off through it. So let's play it your way. I'll get my people moving. Better get the word out."

"Carol, find as many people as you can to spread the news," Holden said. "Make sure everyone brings as much food and water as they can reasonably carry, but *nothing* else. The planet's on fire. Can't stop to save mementos."

"I'll give her a hand," Amos said.

"We're on the clock," Holden reminded them, punching an alert into his hand terminal as he said it. "I want to see all of you inside the structure in four hours, not a minute later."

"We'll try," Carol said.

It took longer to move the colonists than Holden had hoped. Each person told had to express shock and disbelief. Then they had to have a conversation about their surprise. Then they had to have a conversation about what items they'd bring with them. Some argued about bringing personal items, each one sure that their particular case was unique. Every time Holden heard it happen, he wanted to start shouting.

It was the blue sky and gentle breeze. The disaster just wasn't real to them. Not when they could look out across the sky and see nothing but wisps of cloud. They were playing along, because Holden and Carol and Murtry were in charge, and you did what the people in charge asked you to do unless there was a compelling reason not to. But Holden could see the disbelief in their eyes, hear it in every silly delay and argument.

Across the street, a man was clutching a bundle of clothing under one arm while he dragged a large plastic container of water behind him. Amos walked over and traded a few smiling words with the man. The man

vigorously shook his head and tried to walk off. Amos grabbed the bundle of clothes out of his hands and threw them on top of a nearby hut, then picked up the water and shoved it into the man's arms. The man started to argue, but Amos stared him down with a vague smile, and eventually the other man turned and left, trudging after the others headed to the alien ruins.

"Captain?" a tentative voice said to his back. He turned around to find Elvi Okoye smiling up at him, a large sack thrown over one shoulder.

"Hello," he said. "What've you got there?"

"It's blankets. Fayeze and Sudyam and I are bringing all the blankets we had at the compound. The temperature's sure to drop significantly once the debris cloud covers us. The nights will get cold."

"Good thinking. We should probably tell some more people to bring blankets."

"So," she added, still with her unsure half smile, "I wanted to ask for some help for the chemical sciences group."

"Help?"

"The chemical analysis deck is pretty heavy, and they're having trouble moving it. One or two more people would make the job a lot easier."

Holden laughed in disbelief. "We won't be doing science up there, Elvi. Tell them to ditch it and carry water or food instead."

"It makes water," she said.

"They can carry—It makes what?"

"It can sterilize and distill water," she said, nodding as if by doing so she could make him agree faster. "We might need it. For when, you know, the bottles run out."

"Yes," he said, feeling like an idiot.

"Yes," she agreed, smiling helpfully.

"Amos!" he yelled. When the big man came over he pointed at Elvi and said, "Find someone to help you, then follow her. There's a big piece of equipment they need help moving."

"Equipment?" Amos frowned. "Wouldn't food or water be—"

"It makes water," Holden and Elvi said at the same time.

"Roger," Amos said and left in a hurry.

Holden noticed that a subtle darkening of the sky had begun. The sun was still high. It was barely past midday and into the early afternoon. But the sunlight was shifting toward red and the world was darkening along

with it, as though a beautiful sunset were starting about five hours early. Something about the change sent a shiver up his spine.

“Get up there,” Holden said, giving Elvi a gentle push toward the alien towers. “Go now. Tell your people to hurry.”

To her credit, she didn’t argue, just took off at a dead run back toward the RCE science compound. All around him the colonists were moving faster, arguing less, and casting the occasional frightened glance at the sky.

Holden hadn’t been inside the alien structure since he’d looked it over as a crime scene. It had the same eerie and inhuman aesthetic sense he’d seen before, first on Eros after the infection, and later on the Ring Station at the heart of the gate network. Curves and angles that were subtly wrong and yet weirdly beautiful at the same time. He tried to imagine what use the protomolecule masters had made of the buildings, and failed. He couldn’t picture them housing machines like a factory, nor could he picture them as dwellings, scattered with furniture and personal items. It was as if, standing empty as they were, they still fulfilled whatever alien function they’d always been meant to serve.

It was also where Basia Merton and the others had hidden their explosives. Where they’d killed the security team. The bloodiest crimes that had been committed on the planet had all been centered right here, where they were all going now.

“Give me another recount,” Carol Chiwewe said to her aides. “Who are we missing? Find out who we’re missing.”

She’d been doing head counts of the colonists ever since she’d arrived, almost the last person in. They kept coming up with new numbers over and over as stragglers drifted in and people milled around. It was an impossible task, but Holden respected her commitment to ensuring they left no one behind.

The RCE science team huddled together in one rounded corner of the building’s large central room, Elvi among them. Several scientists were fiddling with a large machine. Getting it ready to purify large quantities of water, Holden hoped. Lucia drifted across the room to exchange a few words with Elvi, her son Jacek in tow. Holden breathed a sigh of relief

they'd both made it. Basia would be up on the *Rocinante* going out of his mind with worry, and Holden was happy he'd be able to report that they were as safe as he could make them.

"Hey, Cap," Amos said, coming out of a side room with several colonists trailing. "We got a problem."

"Another one? Worse than the cataclysmic storm heading our way?"

"Related, I guess you'd say," Amos replied. "We've been going through the head counts and looks like the Dahlke family is missing."

"We're sure about that?"

"Pretty," Amos said with a shrug.

Carol saw them talking and made her way through the crowded room toward them. "One hundred percent sure," she said. "Clay Dahlke was in town picking up supplies when we warned him. He headed out to get his wife and daughter. They've got the house farthest outside of town. I should have sent someone along but I was stupid—"

"You had plenty to do," Holden reassured her. "How far from here is the Dahlke place?"

"Three clicks," Amos said. "I'm about to head out with these guys and see if we can find them."

"Wait a minute," Holden said. "I'm not sure you can make a six-kilometer round trip with the time we have left, let alone look for someone."

"Not leaving that little girl out there, chief," Amos said. He kept his voice carefully neutral, but Holden could hear the barest presentiment of a threat hiding in it.

"All right," Holden said, giving in. "But let me call up to the *Roci* and get an update. At least let me do that."

"Sure," Amos said agreeably. "Someone's looking for a poncho for the kid right now anyway."

Holden headed out of the main room and through the confusion of smaller chambers around it, trying to find the entrance. The alien building was a maze of connecting passages and rooms. As he walked, he pulled out his hand terminal. "Alex, this is Holden, you listening?"

The sound coming out of the terminal was filled with static from the atmosphere's heavy ionization, but Holden could still hear Alex when he said, "Alex here. What's the word?"

“Give me an update. How close are we?”

“Oh, boss, you just need to look west.” The fear in Alex’s voice was audible even over the heavy static.

Holden stepped out of the alien tower’s main entrance and looked toward the slowly setting sun.

A curtain of black covered the horizon as far as the eye could see. It was moving so quickly that even from dozens of kilometers away it appeared to hurtle toward him, a black roiling cliff shot through with lightning. The ground beneath his feet trembled and shook, and Holden remembered that sound moved more quickly through a solid than through the air. The vibration he felt now was the sound of all that fury, coming through the earth like an early warning. Even as he thought it, a rising roar started in the west.

“What’s it look like?” Amos had come into the antechamber and was pulling a light backpack on. His colonist friends stood behind him, their faces a mixture of hope and fear.

“It’s too late, big man,” Holden said, looking west and shaking his head. “It’s way too late.”

He wasn’t sure as he said it if he meant for the Dahlkes, or for all of them.

Chapter Thirty: Elvi

The storm front came, seeming slow at first—a tall purple-black churn higher than skyscrapers with only the slightest stirrings in the warm air to show that it was real—and then between one breath and the next, hit with the violence of a blow. Air and water and mud jetted through the windows, archways, and holes in the ruin like the stream from a firehose. It did not simply roar; it deafened. Elvi curled with her back against the wall of the ruin, her arms wrapped around her knees, and endured. The walls shuddered against her spine, vibrating with the hurricane gusts.

Across from her, Michaela had her hands over her ears, her mouth open in a shriek that Elvi couldn't hear. She had thought the rain would be cold, but it wasn't. The slurry that soaked up on the ruin's floor was warm and salty, and somehow that was worse. She laced her fingers together, squeezing until her knuckles ached. The mud-thick water filled the air until the spray made it hard to breathe. Someone lurched through the archway to her left, but she could no more make out who than stop the catastrophe by willing it. She felt certain that the ruins would fail, the more-than-ancient walls snap apart, and she and all the rest of them would be thrown into the storm, crushed or drowned or both. All she could think of was being in the heavy shuttle, the confusion and the panic when it was going down, the trauma of the impact. This felt the same, but it went on and on and on until she found herself almost missing the sudden impact of the crash. That, at least, had ended.

She knew that it was daytime, but the only lights were the cold white of the emergency lights and the near-constant barrage of lightning that caught people's faces like a strobe. A young man, his face set and stony like an

image of suffering and endurance. A child no more than eight years old, his head buried in his mother's shoulder. Wei and Murtry in uniform, standing as close as lovers and shouting into each other's ears in the effort to be heard, their faces flushed red. The vast shifts of barometric pressure were invisible, but she felt them in the sense of overwhelming illness, of *wrongness*, that washed through her body. She couldn't tell if the shaking came from the walls of the storm-battered ruins, more little earthquakes, or her own overloaded nervous system.

At some point, her perception of time changed. She couldn't say if the storm had been hours or days or minutes. It was like the half-awareness of trauma, the doomed patience of being assaulted and knowing the only thing that would end it was the mercy of the attacker. Now and then, she would feel herself rising to some fuller consciousness, and will herself back into the stupor. Shock. Maybe she was going into shock. Her awareness seemed to blink in and out. She was curled against Fayez, both her hands squeezing at his elbow, and didn't remember how she'd gotten there. The dark slurry of mud was ankle high all through the ruins, brown and green. She was covered in it. They were all covered in it.

When this is over, I'm going to go back to my hut, take a long bath, and sleep for a week, she thought. She knew it was ridiculous. Her hut would no more have withstood this than a match could stay lit underwater, but she still thought it and some part of her believed it was true. A blinding-bright flash and crackling detonation came almost simultaneously. She gritted her teeth, closed her eyes, and endured.

The first change she noticed was a baby screaming. It was an exhausted sound. She shifted, her shirt and pants soaked and cold and adhering to her skin with the muck. She craned her neck, trying to find where the grating noise was coming from. She felt the thought shifting at the base of her skull before she knew what it was, a surreal lag between the realization and being conscious of it. She could hear a baby crying. She could hear something—*anything*—that wasn't the malice and venom of the storm. She tried to stand up, and her legs buckled under her. Kneeling in the muck, she gathered herself, squared her shoulders, and tried again. The rain slanted in through the windows of the ruin, but only at about twenty degrees. It still fell in buckets out of a black sky. The wind gusted and pushed and howled. In any other context, it would have been the teeth of a gale. Here and now, it meant

the worst was over.

“Doctor Okoye?”

Murtry’s face was lit from below, the emergency lantern hung over his shoulder. His expression was the same polite smile over sober, focused attention. Her battered mind wondered whether there was anything that could shake the man’s soul, and thought perhaps there wasn’t. She wanted to be reassured by his predictability, but her body wasn’t able to feel comfort. Not now.

“Are you all right, Doctor?” he said, his hand on her shoulder.

She nodded, and when he started to step away, she clutched at him. “How long?”

“The front hit a little over sixteen hours ago,” he said.

“Thank you,” she said, and turned back to the window and the rain. The lightning still played among the clouds and lanced down to the ground, but not so often now. The flashes showed her a transformed landscape. Rivers flowed where yesterday had been desert hardpan. The flowers, or what she thought of as flowers, were churned into nothing. Not even sticks remained. She couldn’t imagine how the mimic lizards could have survived. Or the birdlike animals she’d thought of as rock sparrows. She’d meant to go to the wash east of First Landing and collect samples of the pink lichen that clung in the shadows there. She wouldn’t get to now.

The sense of loss was like a weight on her throat. She had glimpsed an ecosystem unlike anything anyone had ever seen before, a web of life that had grown up apart from anything she had known. She and her workgroups had been the only people ever to walk in that garden. And now it was gone.

“The usual state of nature is recovering from the last disaster,” she said. It was a truism of ecological biologists, and she said it the way a religious person might pray. To make sense of what she saw. To comfort herself. To give the world some sense of purpose or meaning. Species rose in an environment, and that environment changed. It was the nature of the universe, as true here as it had been on Earth.

She wept quietly, her tears indistinguishable from the rain.

“Well, there’s something I wasn’t expecting,” Holden said. She turned to look at him. The dimness of the ruins rendered him in monochrome. He was a sepia print of James Holden. His hair was plastered back, clinging to his head and the nape of his neck. Mud streaked his shirt.

She was too tired to dissemble. She took his hand in hers and followed his gaze toward the back of the ruins. His hand was solid and warm in hers, and if there was some stiffness and hesitation in it, at least he didn't flinch away.

Carol Chiwewe and four other squatters were bailing the storm muck out the window with stiff plastic utility panels, streaks of green-brown staining the pale gray. Behind them, twenty or thirty of the squatters from First Landing were clumped in groups, huddled together under blankets. RCE security moved among them with bottles of water and foil-packed emergency rations. Fayez and Lucia were standing together, talking animatedly. Elvi couldn't make out the words.

"I don't see it," she said. "What weren't you expecting?"

He squeezed her fingers and let go of her hand. Her palm felt colder without his in it.

"Your security people helping the Belters," he said. "I guess nothing brings people together like a disaster."

"That's not true," Elvi said. "We would always have helped. We came out here planning to help. I don't know why everyone thinks that we're so awful. We didn't do anything wrong."

Her voice cracked on the last word, and she started weeping in earnest. She felt oddly distanced from her grief, as if she were watching it from the outside, and then Holden put his hand on her shoulder, and she felt the pain. For a time, it washed her away. Flooded her. Three lightning strikes came close by, loud and bright and sudden, the thunder from them rolling away in the distance.

"I'm sorry," she said, when she could say anything. "There's just been... so much."

"No, I should apologize," Holden said. "I didn't mean to make you feel worse. It's just..."

"I understand," she said, reaching for his hand again. Let him laugh at her. Let him turn her away. She didn't care now. She just wanted to be touched. To be held.

"Hey, Cap," Amos said, looming up out of the darkness. He had a clear plastic poncho over his shoulders, the hood straining to fit the thick neck. "You going to be all right for a while?"

Holden stepped back, retreating from her. She felt a brief, irrational flash

of rage toward the big man for intruding. She bit her lip and scowled up at him. If he noticed, he gave no sign.

“I don’t actually know how to answer that question,” Holden said. “I don’t see any reason I’d die right away. That’s about the best I’ve got.”

“Beats the alternative, anyway,” Amos said. “So that Dahlke family that didn’t make it here before the shit hit the fan? Yeah, some of us are gonna go have a looksee.”

Holden scowled. “You sure that’s a good idea? It’s still pretty bad out there. And this is more water than I’m guessing this place has seen in ever. There’ll be a lot of flooding, and there’s no good way to get help out if something goes south.”

“They had a little girl,” Amos said. The two men exchanged a long look that seemed to carry the weight of some earlier conversation. Elvi felt like a stranger watching two family members communicate in the half-code of long familiarity.

“Be careful,” Holden replied after a long moment.

“That ship may have sailed, but I’ll do what I can.”

Wei walked toward them. She’d taken off her armor, but she still had an automatic rifle strapped to her back. She nodded at Amos. “I’ve got a couple more who want to tag along.”

“Don’t matter to me if it don’t matter to you,” Amos said. Wei nodded. There was a darkness in her eyes that seemed to echo Amos’.

Elvi looked over. A half dozen other people were struggling into the same kind of poncho Amos wore. In the dimness and the wreckage, it was hard to tell which of them were squatters and which were RCE. Even Belters and Earthers were hard to differentiate now. Elvi didn’t know if that was an artifact of the darkness or if some deeper part of her brain was changing her perceptions, making anything human into something like her. Minds could be tricky that way.

Among them, she caught a glimpse of Fayeze and her mouth went coppery with sudden fear. “Wait,” she said, hopping across the space. “Fayeze, wait. What are you doing?”

“Helping out,” he said. “Also, getting out of this sardine can. I’ve gotten used to having a couple feet of social distance. Just being around all these people stresses me out.”

“You can’t. It’s dangerous out there.”

“I know.”

“You stay here,” she said, grabbing at his poncho and tugging it up, trying to get it back over his head. “I can go.”

“Elvi,” he said. “Elvi! Stop it.”

She had a double handful of plastic sheeting in her fingers. It was already wet.

“Let them go,” she said. “They’re professionals. They can take care of this. We... people like us...”

“We’re past us and them at this point. We’re just people in a bad place,” Fayez said. And then a moment later, “You know what I am, Elvi.”

“No. No, you’re a *good* man, Fayez.”

He tilted his head. “I meant that I’m a geologist. It’s not like they need me to talk about plate tectonics. What were *you* thinking?”

“Oh. Ah. I just...”

“Come on, Professor,” Wei said, tapping Fayez on the arm. “Time to go for a walk.”

“How can I refuse?” Fayez said, gently taking the plastic sheeting out of Elvi’s hands. She stood watching as six of them walked together toward the entrance. Amos, Wei, Fayez, and three of the squatters—no, two squatters and Sudyam—one-use chemical lanterns glowing in their hands. They walked out into the gale. She stood at the window, ignoring the rain that soaked her. Amos and Wei took the lead, their heads down, their ponchos blowing out behind them. The others followed close behind, clustered like ducklings. The night around them was black and violent, and they moved into the downpour, growing fainter with every minute until she couldn’t make them out at all. She stood there a while longer, her mind empty and exhausted.

She found Lucia and Jacek in one of the larger chambers. Two Belters were struggling to place a wide plastic panel over one of the windows to block the rain now that the wind wasn’t so violent that it would simply shatter. A half dozen others were scraping out the muck. They’d already done so much work, Elvi could see pale strips of the ground. Everywhere people were sleeping, curled into and against each other. The sound of the storm was still enough to drown out their moans. Or most of them.

Lucia looked up at her. The woman seemed to have aged a decade, but she managed a smile. Elvi sat down beside her. They were both covered in

salt mud, and the muck was starting to reek a little. Putrescence or something like it. All the small life forms living in the planet's great ocean that had been broken and thrown to the sky, starting to decay. It broke her heart to think of the scale of the death that surrounded them, so she didn't.

"Can I help you?" Lucia said.

"I came to ask the same thing," Elvi said. "Tell me what I can do."

The long, terrible night went on, the rain slackening only slightly. No light came through the clouds. No rainbows promised that the disaster was ended. Elvi moved from one group to another, talking and checking. Some were the squatters, some were RCE. All had the same stunned expressions, the same sense of amazement that they were still alive. The scent of the muck was getting richer and more pungent as whatever organic structures it had held broke down. Elvi hated to imagine how the world would stink when the last of the rains fell and the sun came back to warm the landscape. That was a problem for another time.

She didn't notice it when she fell asleep. She'd been at the window, looking out in hopes of catching a glimpse of the search party's return. She remembered very clearly hearing Holden's voice behind her and a woman replying to him. She'd meant to turn back, find him, ask if she could help. If she could do something to stay in motion, to keep from thinking or feeling for another hour more. But instead she woke up.

For a moment, she didn't know where she was. Her exhaustion-drunk mind tried to make the close quarters into her cabin on the *Israel*, as if she were still on the journey out to New Terra. As if none of this had ever happened. Then the present reasserted itself.

She was in the corner of a smaller chamber. Eight other people were stretched out on the damp ground around her, heads pillowed by their arms. Someone was snoring, and a body was pressed up against hers. Lightning stuttered in the distance, and she saw the body beside hers was Fayez. The thunder came a long time later, and softly. Then there was only the patter of rain. She touched his shoulder, shaking him gently.

He groaned and shifted, the poncho still on him crackling with the motion. "Well, good morning, Doctor Okoye," he said. "Imagine meeting

you here.”

“Is it?”

“Is it what?”

“A good morning.”

He sighed in the dark. “Honestly, I don’t even think it’s morning.”

“Did you find them?”

“We didn’t find anything.”

“I’m sorry.”

“I mean we didn’t find anything at all. The huts are gone. First Landing’s gone. The mine pit’s gone or else the landmarks are so different we couldn’t find it. The roads are gone.”

“Oh.”

“You know those pictures you see of a natural disaster where there’s nothing but mud and rubble? Imagine that without the rubble.”

Elvi lay back down. “I’m sorry.”

“If we only lose them, it’ll be a miracle. We managed to get a signal through to the *Israel*. The atmospheric data make it look like we’ll be going without a sunrise for a good long time. No one said the words ‘nuclear winter,’ but I think it’s safe to say things aren’t going to be business as usual around here for a nice long while. We’ve got the battery power we carried in with us, but no hydroponics. Only as much fresh water as the chemistry deck will pump out. I was hoping that some of the storage buildings might have made it. They were pretty well built, some of them.”

“Still. Maybe some good can come out of it.”

“I admire your psychotic optimism.”

“I’m serious. I mean look at us all. You went out with Amos and Wei and the locals. We’re all here together. Working together. We’re taking care of each other. Maybe this is what it takes to resolve all the violence. There were three sides before. There’s only one side now.”

Fayez sighed. “It’s true. Nothing points out shared humanity like a natural disaster. Or a disaster, anyway. Nothing on this mudball of a planet’s even remotely natural if you ask me.”

“So that’s a good thing,” she said.

“It is,” Fayez agreed. And then a moment later, “I give it five days.”

Chapter Thirty-One: Holden

Holden had witnessed the aftermath of a tornado as a child. They were rare in the Montana flatlands where he'd grown up, but not entirely unheard of. One had touched down on a commercial complex a few miles from his family's farm, and the local citizens had gathered to help with the cleanup. His mother Tamara had taken him along.

The tornado had hit a farmers' market at the center of the complex, while totally avoiding the feed store and fuel station on either side of it. The market had been flattened as if by a giant's fist, the roof lying flat on the ground with the walls splayed out around it. The contents of the store had been scattered in a giant pinwheel that extended for hundreds of meters around the impact point. It was young James Holden's first experience with nature's fury unleashed, and for years afterward he'd had nightmares about tornadoes destroying his home.

This was worse.

Holden stood in what his hand terminal told him had been the center of First Landing, the constant rain sheeting off his poncho, and turned in a slow circle. All around there was nothing but thick mud occasionally cut by a rivulet of water. There were no flattened buildings. No wreckage strewn across the ground. With the fury and duration of the winds, it was entirely possible that the detritus of First Landing was hundreds or even thousands of kilometers away. The colonists would never rebuild. There was nothing *to* rebuild.

A ripple of lights danced through the heavy cloud cover overhead, and a second later the booming of the thunder, like a barrage of cannon fire. The rain intensified, reducing visibility to a few dozen meters, and swelling the

little streams cutting gullies across the muddy ground.

"I'd say 'what a mess,' but it's actually kind of the opposite of that," Amos said. "Never seen anything like this, Cap."

"What if it happens again?" Holden said, shuddering either at that thought or at the cold rainwater trickling down his back.

"Think they have more than one of whatever blew up?"

"Anyone know what the first one was yet?"

"Nope," Amos admitted with a sigh. "Big fusion reactor, maybe. Alex sent an update, said it tossed a lot of radiation up around the initial blast."

"Some of that will be coming down in the rain."

"Some."

The mud at Amos' feet moved, and a small, sluglike creature pushed its way up out of the ground, desperately trying to get its head above water. Amos casually kicked it into one of the nearby streams where the current whisked it away.

"I'm running low on my cancer meds," Holden said.

"Radioactive rain ain't gonna help with that."

"Was my thought. Bad for the colonists too."

"Do we have a plan?" Amos asked. His tone suggested he didn't expect an answer.

"Get off this hell-planet before the next catastrophe."

"A-fucking-men," Amos replied.

They walked back toward the alien towers, trudging through the thick mud and occasionally having to leap across a newly formed arroyo filled with fast-moving water. The ground was covered with small holes where brightly colored worm-slugs had pushed their way to the surface, and shiny trails of slime radiated in all directions showing their recent passage.

"Never seen these before," Amos said, pointing at another of the creatures slowly making its way across the wet ground. They weren't much bigger than Holden's thumb, and eyeless.

"Forced up by the rain. This was pretty arid land before. There's a lot of subterranean life drowning right now I'd bet. At least these guys have a way to get out of it."

"Yeah," Amos said, frowning down at one, "but, you know, gross. One of those things climbs into my sleeping bag, I'm gonna be pissed."

"Big baby."

As if in response to Amos' worries, the ground shifted and dozens more of the slugs pushed their way up. Wrinkling his nose in disgust, Amos picked his way through them, trying not to get their slime on his boots. The trails they left were quickly washed away by the rain.

Holden's had terminal buzzed at him, and he pulled it out to find that a message had been downloaded. The terminal had been trying to connect to the *Roci* for hours. There must have finally been a break in the storm long enough for it to send and receive updates.

He tried to open a channel to Alex, but got only static. Whenever his window had happened, he'd missed it. But the fact that there were occasional breaks in the atmospheric clutter was a hopeful sign that they'd get comms back soon. In the meantime, he could keep sending messages and hoping they'd slip through the static a bit at a time.

The update waiting for him was a voice message. He plugged the bud into his ear and hit play.

"This is a message for Captain James Holden, from Arturo Ramsey, lead counsel for Royal Charter Energy."

Holden had sent dozens of requests to the various senior vice presidents and board members of RCE for Naomi to be released. Getting a reply back from the company's top lawyer was not a good sign.

"Captain Holden," the message continued, "Royal Charter Energy takes your request for the release of Naomi Nagata from detention on the *Edward Israel* very seriously. However, the legal landscape we're navigating with this situation is murky at best."

"It's not murky, give me my damn XO back, you smug bastards," Holden muttered angrily. At Amos' questioning look he shook his head and continued the recording.

"Pending further investigation, we're afraid we're going to have to follow the advice of the security team on site and hold Naomi Nagata in protective custody. We hope you understand the delicate—"

Holden turned off the recording in disgust. Amos raised an eyebrow.

"That's the legal wonk at RCE telling me they plan to keep holding Naomi," Holden said. " 'Following the advice of the security team on site.' "

"Murtry," Amos grunted.

"Who else?"

“Sort of wondering why you haven’t let me off the leash on that, Cap,” Amos said.

“Because, before *this*”—Holden waved an arm at the mud and rain and worms around them—“we had a job to do that would not have been aided by murdering the RCE security chief.”

“Would’ve loved to give it a try, though. You know, just to see.”

“Well, my friend, you might still get your shot,” Holden said. “Because I am about to order him to do something he really isn’t going to want to do.”

“Oh,” Amos said with a smile, “goody.”

When they returned to the ruins, the camp was in chaos. People were frantically sweeping something out of the tower entrance using blankets and sticks and other makeshift implements. An agonized howl echoed out of the structure, like someone in terrible pain.

Doctor Okoye spotted them from the tower opening and ran to meet them. “Captain, we have a serious problem.” Before he could reply, she kicked one of the worms away from his feet with a squeal. “Look out!”

Holden had watched her capture and sacrifice a number of the local fauna during their association. She’d never struck him as squeamish. He couldn’t picture a few slimy slug analogs being the thing that broke her.

“What’s going on?” he asked when she’d finished kicking slugs away from him.

“A man died,” she said. “The one who was married to the man and woman who took care of the carts. The taller one. Beth is her name, I think. The wife’s name. That’s her crying inside.”

“And that relates to the worms how?”

“That slime they secrete is a neurotoxin,” Elvi replied, wide-eyed. “He touched it, and it was almost instant paralysis. Full respiratory failure. One of the worms was climbing up a wall near their sleeping area and he grabbed it to throw it outside. By the time we realized what was happening, he was dead.”

“Jesus,” Amos said, staring down at the worms surrounding them, something like respect mixed in with his disgust.

“Some kind of defense toxin?” Holden asked.

“I don’t know,” Elvi replied. “It might just be slime to aid in locomotion, like a terrestrial slug. It might not be toxic to the other life forms on New Terra. We’ve never even seen them before. How can we know anything? If I had my collection equipment, I could send the data back to Luna, if I could send the message back to Luna, but—”

Elvi’s voice was rising as she spoke. When she ended, she was almost in tears. “You’re right,” Holden said. “It was a stupid question, and it doesn’t matter anyway.”

“Why doesn’t it—” Elvi started, but Holden pushed past her.

“Where’s Murtry,” he asked.

“Inside, organizing the people to find and remove all the slugs from the structure.”

“Come on, Amos,” Holden said. “Let’s change his priorities.”

Inside, the fear was so pronounced it was almost an odor. Half of the colonists were in almost frantic activity, building slug-sweeping implements and clearing the structure. The other half sat on the floor, many wrapped tight in blankets, empty expressions on their faces. The human mind could only take so much threat. Everyone had a different limit, and he couldn’t really blame the people who had been broken by the last thirty hours. It was actually sort of amazing that it hadn’t happened to all of them.

He was, however, unsurprised to see Basia’s wife and son busily at work with the chemical sciences team.

“Doctor Merton,” he greeted her with an apologetic smile.

“Captain,” she replied. Her returning smile was thin, and very tired. As the colony’s only doctor, she’d had a very long day.

“I’ve heard about the death,” he started, but she cut him off with a sharp nod and a gesture toward the chemical analysis deck.

“We’re analyzing the toxin right now,” she said. “It’s unlikely we’ll be able to make a counter-agent with the tools available, but we’re going to try.”

“I appreciate the effort,” Holden said. “But I’m hoping to make it unnecessary.”

“Are we being forced to leave?” she said, a look of sad resignation replacing her wan smile. “After all this...”

“Maybe not forever,” Holden said, putting his hands on her shoulders. She felt very thin.

She nodded slowly, looking around them at the dirty, frightened people filling the room. "I can't argue. There's nothing left to fight over."

Oh, Holden thought, *some people can always find a reason to fight, speaking of which*. "I need to find Murtry."

Lucia gestured at an opening behind her, and Holden left with one last squeeze of her shoulders and what he hoped was an encouraging smile.

In the next room, Murtry was down on his haunches looking at something on the floor. Wei stood behind him, nose wrinkled in disgust and her rifle in her hands.

"Wei," Amos said with a nod.

"Amos," the security officer replied with a grin.

Holden wondered what was going on there. They couldn't have a thing, could they? When would they have found time to have a thing? But they definitely acted like they were sharing a private joke.

"Captain Holden," Murtry said, standing up, not giving him more time to think about possible Amos-and-Wei dalliances. On the floor behind the RCE security chief was a clear plastic bowl inverted over one of the slugs. The creature was nuzzling its prison with its pointed eyeless face.

"Made a friend," Holden said, pointing at the slug.

"They say it's a good idea to know your enemy," Murtry replied.

"They say a lot of stuff."

"Yes. Yes, they do. How did the recon go?"

"About how you'd expect," Holden said. "Initial reports are correct. There isn't a single standing structure. Not even the remains of one. All the colony supplies are lost. We can make potables out of ground water until the chem lab runs out of supplies. But what's raining out of the sky is radioactive, and probably has things living in it."

"All right," Murtry said, scratching his ear with one thick fingernail. "Can we agree that at present, the insurgent colony might not be viable?"

"You don't have to sound happy about it."

"I'm going to have some relief flown down as soon as comms clears up. RCE is happy to share these needed supplies with the refugees."

"Very magnanimous," Holden said. "But RCE is going to do me a bigger favor."

"Oh," Murtry said, his face shifting into a smile. "We are?"

"Yeah. Go ahead and bring the supply shuttle down. Evacuation is going

to take some time, and we'll want plenty of medicine, food, and shelter to keep these people healthy until everyone is off-world."

"Off-world? Sounds like you're doing *us* a favor there, Captain."

"I'm not done," Holden said, and took a step forward, deliberately moving into Murtry's space. The security man stiffened, but didn't step back. "When the shuttle leaves, it's going to take some of the colonists with it. The sick and vulnerable first. And as soon as your people can de-weaponize the second shuttle, it'll start making runs too. I'm giving the same orders to the *Barbapiccola* and the *Rocinante*. We're leaving this planet, and if I can't stick everyone on the *Roci* and the *Barb*, the *Edward Israel* will be taking the rest."

Murtry's smile cooled. "Is that right?"

"It is."

"I fail to see why the ship that brought the squatters here can't also take them away," Murtry said.

"One, it no longer has the room," Holden started.

"Then they should dump the ore they illegally stole from this world," Murtry said.

"And two," Holden continued as if he hadn't interrupted, "she's down to the last of her supplies. I won't stick hundreds of people on that ship that may not make it back to Medina. I doubt it's RCE policy to ignore a humanitarian crisis. And even if it is, it's sure as hell going to make for terrible press."

Murtry took an answering step toward Holden, crossing his arms and shifting his smile into an equally meaningless frown.

Plan B is that I have Amos kill you right now and just take what I want when the shuttle lands, Holden thought, but worked to keep it off his face.

Almost as if he could sense the thought, Amos shuffled forward and put one hand on the butt of his pistol. Wei shifted to his right, still gripping her rifle.

We are so close, Holden thought, *to all of this going completely off the rails*. But he couldn't back down. Not with a couple hundred people living or dying on the outcome of the confrontation. Wei cleared her throat. Amos grinned back at her. Murtry cocked his head to one side, his frown deepening.

Here we go, Holden thought, and suppressed the urge to swallow a

mouth suddenly full of saliva.

“Of course,” Murtry said. “We’d be happy to assist.”

“Uh,” Holden replied

“You’re right. We can’t leave them here,” Murtry continued. “And there isn’t room for them anywhere else. I’ll let the *Israel* know they’re taking on passengers as soon as we get comms up.”

“That would be great,” Holden said. “Thank you.”

“Doctor Okoye,” Murtry said. Holden turned to find the diminutive scientist had come in, her usual tentative smile on her face.

“Sorry to interrupt,” she said. “But we’ve gotten the radio back up. We’re on with the *Israel* right now. You said to tell you as soon as we got through.”

“Thank you,” Murtry said and started to follow her out of the room. He paused, as though something had suddenly occurred to him, and turned to Holden. “You know, we’re only in this situation because these people came down and built a shantytown. We’d brought much better structures with us on the heavy shuttle. Much of this could have been avoided.”

Holden started to reply, but Elvi said, “Oh, no. I’m unhappy about the loss of the dome and the permanent structures too. But we clocked gusts of three hundred and seventy kilometers an hour out there. Nothing we set up would have withstood that.”

“Thank you, Doctor Okoye,” Murtry said with a tight smile, “for correcting me. Let’s go call the ship, shall we?”

Elvi blinked in puzzlement as Murtry left. “Is he mad at me?”

“Sweetie,” Amos said, clapping her on the back, “that just means you’re not an asshole.”

Chapter Thirty-Two: Havelock

After they'd lost radio contact with Murtry, Havelock had tried to sleep. He *should* have slept. There was nothing he could do. Not yet, anyway. Not until it was over. He floated in his couch, the straps keeping him centered over the gel, and willed his consciousness to fade. His mind wouldn't rest. Were they still alive down there? What if the explosion was just the first of several? What if the planet detonated and took out the *Israel*? Should he have Marwick pull the ship into a higher orbit? Or even away from the planet entirely? And if the *Barbapiccola* tried to do the same... then what? He wasn't supposed to let them break orbit with a full load of RCE's lithium ore.

He closed his eyes again, but they opened as soon as he stopped consciously willing them shut. After three hours, he gave up, took off his straps, and went to the gym instead. His float-atrophied muscles complained with every set, and he put the feed of the planet below on the screen. The contours of New Terra were gone. The whole planet had become a flat and uniform gray, clouds obscuring whatever violence was happening beneath them. After the exercise round, he bathed, changed into a fresh uniform, and went to his office. His incoming message queue was filled with requests for comments from every news organization there was, and several he doubted were real. He forwarded them all to the RCE corporate headquarters on Luna. Let them answer if they wanted to. At this point, they knew as much as he did.

He checked on comms from the planet, but the signal wasn't getting through. So he checked again. And again. The gray planet was silent.

"Any word?" the prisoner asked.

“Nothing,” Havelock replied. And then, a moment later, “I’m sorry.”

“Me too,” she said. “They’ll be all right.”

“I hope so.”

“Are *you* all right?”

Havelock looked over at her. For a detained saboteur who’d been in the box for days now, she looked calm. Almost amused. He found himself smiling back at her.

“Might be a little stressed,” he said.

“Yeah. Sorry about that.”

“Not your fault,” Havelock said. “You aren’t the one calling the shots around here.”

“There’s someone calling the shots around here?” Naomi asked, and a man cleared his throat behind him. Havelock shifted his couch, the bearing hissing, to look back at the hatch. The chief engineer floated there. He wore the militia armband over his uniform sleeve.

“Hey there, chief,” he said, pulling himself into the room. “Wondering if we could have a talk. Alone, maybe.”

“You can put up the privacy shield if you want,” Naomi said. “I’ll still hear everything.”

Havelock undid his straps and pushed off. “I’ll be back,” he said over his shoulder.

“You shall always find me at home,” Naomi said.

The commissary was between rushes. The chief engineer grabbed a bulb of coffee for himself and another for Havelock. They floated together near a table bolted to the deck. Force of habit.

“So we’ve been talking,” Chief Engineer Koenen said. “About the event.”

“Yeah, it’s been pretty much the only thing on my mind too.”

“How sure are we that it’s... well... *natural*?”

“I’d have gone pretty much a hundred percent it wasn’t,” Havelock said with a grim laugh. The chief engineer’s expression seemed to close, and Havelock pressed on. “But maybe that depends on what you mean by natural. Is there something bothering you?”

“I don’t want to sound paranoid. It’s just that the timing on this seems pretty convenient. You and me and the boys catch the UN mediator red-handed. Throw the bitch in the brig. And then this big disaster comes out of

nowhere, takes everyone's attention off her."

Havelock sipped at the coffee.

"What are you thinking, chief? That it was rigged?"

"Those squatters got here before we did. We don't know what they found and just never told us about. And Holden worked for the OPA. He worked for Fred fucking Johnson, right? Hell, everything I heard says he's been sleeping with that Belter girl we brought in. His loyalty isn't to Earth. And he was the one who went on the alien whatever-the-hell-it-is that Medina Station's floating around and came back out. I've been following some independent casts. The Martian marines that went there after him? There's some pretty weird shit that's gone on with all of them since then."

"Weird shit like what?"

The chief engineer's eyes brightened and he hunched forward, a posture of intimacy and complicity that was a habit of gravity. For the next half hour, he ran down half a dozen strange occurrences. One of the marines had died of an embolism during a heavy-g burn just before she'd been scheduled to talk with her cousin who ran a popular newsfeed. Another had quit the military and wasn't talking about anything that had happened. There had been rumors of a secret report that suggested—strongly suggested—that James Holden had been killed on the station, and a doppelgänger put in his place. It stood to reason with all the other changes the protomolecule could make to a human body that recreating one wouldn't be hard for it. Only the report had never been made public, and the people who had read it had been targets of whisper campaigns to discredit them.

Havelock drank his coffee and listened, nodding and asking the occasional question—usually for the sources of the information the chief engineer was reporting. When they were done, Havelock promised to look into the issue, then hauled himself back to his desk. On the readout, the planet was still covered in clouds.

"Everything okay?" Naomi asked.

"Fine," he said. And then a moment later, "Just scared people trying to find a version of events where someone has control over everything."

She chuckled. "Yeah. I'm doing the same."

"You are? How?"

"Chewing down my fingernails and praying," she said. "Mostly

praying.”

“You’re religious?”

“No.”

“Are you and Holden secretly alien spies that blew up the planet as part of a Belter conspiracy to distract the media?”

Naomi’s laughter was deep. “Oh, was that what it was? I’m so sorry.”

Havelock chuckled too, feeling a little guilty as he did. Koenen was one of his people. Naomi Nagata was a saboteur and the enemy. And still, it was a little funny, and there wasn’t anyone else to talk with.

“It’s not that bad. Conspiracy theories come up whenever people feel like the universe is too random. Absurd. If it’s all an enemy plot, at least there’s someone calling the shots.”

“Belters.”

“This time, yeah.”

“Are they going to break in here and throw me out the airlock?”

“No, they’re not like that,” Havelock said. “They’re good guys.”

“Good guys who think I destroyed a planet.”

“No, that your alien doppelgänger boyfriend did to keep people from thinking about you. Don’t worry. You’ll be fine. No one’s really thinking you’re in league with the protomolecule. They’re just scared.”

Naomi went quiet. Her fingertips pressed against the cage and she hummed quietly to herself. It wasn’t a melody Havelock knew. He checked his incoming queue again. Another half dozen requests for comment. A note from one of the security team that the Belters on the *Israel* had started sitting together in the commissary and exercising together in the gym. It seemed suspicious to the man making the report. It sounded like circling the wagons to Havelock. He’d have to think about what to do about that. If anything. The radio signal to the planet still didn’t go through. The analysis of the IR sensors that could see through the cloud cover was that First Landing was being destroyed by the storm. He turned his attention to the sensor array data as it streamed back to Earth. Maybe someone there could make something of it. The first-report newsfeeds were already speculating that it had been a fusion core overloading. Having just heard about how Jim Holden was a shapeshifting alien left him a little skeptical about everything.

When, six hours later, his hand terminal lit up with an incoming request from Murtry, Havelock felt a huge weight lifting from his shoulders. He

accepted the connection, and a low-res Murtry fuzzed to life on the screen. The feed jumped and hopped, but the audio quality was all right apart from a little static.

“Good to see you, Havelock. How’re things holding together up there?”

“No complaints, sir. Mostly we were waiting to hear from you. That looks like a hell of a rainstorm you’ve got going down there.”

“Loss of life was minimal,” Murtry said. “A few of the squatters didn’t bother getting to shelter in time, and the floodwaters pulled some local bugs out from the ground that’ll kill you if you touch them. They lost another one to that. Our people are fine. The camp’s a loss.”

“Ours or theirs?”

“Ours *and* theirs. Everyone down here’s going to be starting over from scratch.”

“I’m sorry to hear that.”

“Why?”

Havelock blinked. His smile felt nervous. “Because we just lost everything.”

“We didn’t lose as much as they did,” Murtry said. “That makes this a win. We’re going to need to pack the shuttle with relief supplies and get it down here. Food. Clean water. Medical supplies. Warm clothes. No shelters, though. Or if they are, make ’em those cheap laminate ones that won’t hold up for more than a week.”

“Are you sure? I can get some emergency prefabs worked up—”

“No. Nothing like permanent shelter comes down here until our people are the only ones using it. And we’ll be hauling up some of the squatters. Can you start setting something up for an extra hundred or so people? It doesn’t need to be comfortable, but it has to be something we can control.”

“We’re bringing the squatters on the *Israel*, sir?”

“We’re getting them off the planet and putting them under our thumbs,” Murtry said with a smile. “His Holiness, Pope Holden, thinks he bullied me into it. That man is about as smart as a dead cat.”

Havelock was suddenly acutely aware that Naomi’s privacy shield was down and every word of his conversation was carrying to her. He tried to think of a way to trigger it that wouldn’t let Murtry know that he’d forgotten protocol up to now.

“There a problem, Havelock?”

“Just thinking where we can put them, sir,” Havelock said. “We’ll come up with something.”

“Good man. This thing was a lucky break. Play this right, and we’ll get all the squatters off the planet. Even if we can’t, they’re going to have hell’s own time claiming they’ve got a viable settlement.” Murtry’s smile was thin. “This last sixty hours, we’ve probably made more progress toward straightening this mess out than all the time since we came out here.”

Naomi rapped against the cage with her knuckles, the grate clacking softly enough that the hand terminal’s mike didn’t pick it up. Her eyebrows were raised in query, but she didn’t speak. Havelock made the smallest possible nod.

“What about the mediation team?” he asked. “Holden and his people?”

“Holden and Burton are fine. Burton almost got his ass caught out in the worst of it, but it didn’t quite happen,” Murtry said with a shrug and a smile. “Can’t have everything.”

Havelock winced, thinking how callous Murtry’s words would sound to someone who didn’t know him. “Well, let them know we’ll put together relief supplies and get them down there as soon as we can get through the cloud cover.”

“No permanent structures.”

“No, sir. I understand.”

“I’m going to want to get some of our science team up when the shuttle goes back too. The ones that’re going a little too native. I’ll work up an evac list.”

“Do you want me to get the... ah... other shuttle ready to return to normal duty?” Havelock said, hoping that Murtry wouldn’t tell him to keep the weapon live. There was silence on the connection. “Sir?”

“We’ll have to, won’t we?” Murtry said. “Yeah, all right. But be ready to put it back in play as soon as the evacuation’s done. I don’t like giving up our advantages for nothing.”

“No, sir,” Havelock said. “I’ll see to it.”

“Good man.”

The connection died. Havelock started pulling up the duty roster and inventory lists. It was almost a minute before he risked glancing over at Naomi. She looked like she’d eaten something unpleasant.

“That’s who you work for?”

“He’s the chief of security,” Havelock said.

“That man is a snake.”

“He just came off badly,” Havelock said. “He didn’t know you could hear him.”

“If he had, he might have hissed a little different,” she said. Then a moment later, “Do you have any selective apoptosis catalysts on board?”

“Oncocidals? Sure, anti-cancer meds are standard.”

“Would you send some down in the shuttle?”

“I think antibiotics and clean water are more likely to—”

“Holden needs them. He caught a lot of rems on Eros. It’s not a big thing when we have a med bay, but he pops a new tumor every month or two. Unless Alex decides to take the *Roci* down into that soup, they may be down there for a while.”

He should probably have said no. She was his prisoner, and doing her favors wasn’t really part of the job. But she hadn’t made it clear to Murtry that she was listening. She could have embarrassed him and hadn’t.

“Sure,” he said. “I don’t see why not.”

“About that dead cat thing...”

“Yeah?”

“A lot of people have underestimated Jim over the last few years,” Naomi said. “A lot of them aren’t with us anymore.”

“A threat?”

“A heads-up not to make the same mistake your boss is making. I like you.”

Putting the relief supplies together was easy. Everyone on board had been waiting for a chance to do something. Food, fresh water, polyfiber blankets, and medical supplies—including a box of oncocidals with Holden’s name on the top—filled the shuttle’s hold until there was hardly room to close the door. Havelock found himself watching the sensors, waiting for the clouds to thin enough for the one tiny light of First Landing to show through. It was a shock to remember that those lights weren’t going to shine again. That they were gone. Havelock hadn’t been there. He’d never been to the surface of New Terra at all, and still the idea of the one human settlement

being wiped away bothered him.

“This is shuttle two requesting permission to drop,” the pilot said, her voice a slow drawl.

“Captain Marwick here. Permission’s given. Godspeed.”

Havelock watched his display as the shuttle’s thrusters went bright, driving it away from the *Israel* and down. The danger was turbulence in the lower atmosphere. Even if there were evil winds in the outer layers, the air was so thin there, the shuttle would be able to shrug them off. When it got down to the clouds, Havelock told himself, the real danger would begin.

The shuttle dropped, its body becoming only a light spot against the darker gray of the clouds. The sensor data feed from it looked fine. The turbulence was worse than Havelock had expected, but not so bad as he’d feared. The farther down it went, though—

The data signal dropped. Havelock switched over to visual in time to see the shuttle’s bright flare fade. A puff of smoke a few kilometers higher showed where it had detonated. The shock of it, the horror, was like being punched in the gut. He barely noticed the flickering of the lights in the *Israel* or the stuttering whine of the air recyclers restarting.

“Havelock?” the prisoner said. “Havelock, what’s happening? Did something go wrong? Why’s everything rebooting?”

He ignored her, leaning close to his terminal screen. The shuttle was dead, falling to the distant ground of New Terra in a hundred flaming bits. But there was something in the images. A barely visible line that passed through the cloud of smoke and debris where it had died. Something had shot the shuttle down. His first thought was the *Barbapiccola*. His second was the *Rocinante*. He pulled up the orbital tracking, trying to find how the enemy ships had taken action, but the only thing that intersected the line at the moment when the shuttle died was one of New Terra’s dozen tiny moons...

His mouth went dry. He heard the emergency Klaxon sounding for the first time, though he realized now it had been going for a while. Since the shuttle exploded, he thought. He assumed. Naomi Nagata was shouting at him, trying to get his attention, trying to get him to talk to her. He put a priority connection request through to Captain Marwick. For five long seconds, the captain didn’t respond.

“It was the planet,” Havelock said. “The shuttle. It was shot down by

something on one of those moons.”

“I saw that,” Marwick said.

“What the hell was it? Some kind of alien weapon? Did the planet blowing up turn on some kind of defense grid?”

“Couldn’t say.”

“I need everything we have on that. All the sensor data. Everything. I need it sent back to Earth, and I need it ready for Murtry and the science team. I’m giving blanket permission for anyone on the crew to see it. Any information we can get—anything—is our top priority.”

“Might not be our top,” the captain said. “My plate’s a bit full right now, but as soon as I’ve a spare moment—”

“This isn’t a request,” Havelock shouted.

When Marwick spoke again, his voice was cool. “I’m thinking you might not have yet noted that we’re on battery power, sir?”

“We’re... we’re what?”

“On battery power. Backup, as you might say.”

Havelock looked around his office. It was like seeing it for the first time. His desk, the weapon locker, the cells. Naomi looking out at him with an expression of barely restrained alarm.

“Did... did it shoot us too?”

“Not so far as I can see. No new holes through the hull, certainly.”

“Then what’s going on?”

“Our reactor’s down,” Marwick said. “And it seems it won’t restart.”

Chapter Thirty-Three: Basia

What does that mean?” Basia asked.

Well,” Alex said, “it’s complicated, but these little pellets of fuel get injected into a magnetic bottle where a bunch of lasers fire. That makes the atoms in the fuel fuse, and it releases a *lot* of energy.”

“Are you making fun of me?”

“No,” Alex said. “Well, maybe a little. What exactly are you asking?”

“If our reactor is off-line, does that mean we’ll crash? Is the ship broken? Is it just us? *What does it mean?*”

“Hold your horses,” Alex said. He was sitting in his pilot’s chair doing complicated things with his control panel. “Yeah,” he finally said, dragging the word out into a long sigh. “Reactors are off-line on the *Israel* and the *Barb*. That’s a lot worse for them than it is for us.”

“Felcia—my daughter is on the *Barbapiccola*. Is she in danger?”

Alex started working on his panel again, his fingers tapping out commands faster than Basia could follow. He clucked his tongue as he worked. The clucking while Basia waited for an answer made him want to scream and choke the laconic pilot.

“Well,” Alex drawled out, then tapped one last control and a graphic display of Ilus with swirling lines around it appeared. “Yeah, the *Barb*’s orbit is decaying—”

“The ship is crashing?” Basia yelled at him.

“Wouldn’t say crashing, but we’ve all been keeping pretty low, with bringing up ore and all. Most times adding a little velocity’s just the way you do it, but—”

“We have to go get her!”

“Ease down! Let me finish,” Alex yelled back, patting the air in a placating gesture that made Basia want to punch him in his face. “The orbit’s always decaying, but it won’t be dangerous for days. Maybe longer, depending on how long they can run the maneuvering thrusters on battery power. Felcia’s not in any danger right now.”

“Let’s go get her,” Basia said, taking deep breaths to keep his words calm and level. “Can we do that? Can we go to her ship without the reactor?”

“Sure. The *Roci*’s a warship. Her battery backups are robust. We can do quite a bit of maneuvering if we need to. But with the reactor down, every bit of power we pull off those batteries is gone. It ain’t gettin’ replaced. Lose too much of it to land, and we’ll be in the same position as them. We’re not doing anything until we make a plan. So calm down, or I’ll lock you in your cabin.”

Basia nodded, but didn’t trust himself to speak around the rising panic in his chest. His daughter was on a spaceship that was falling out of the sky. He might never be calm again.

“On top of which,” Alex continued, “you think everyone else on the *Barb* is just gonna be okay with us leaving without them? We don’t have room for everyone on that ship. Docking with a ship full of frightened people looking to get off is never plan A.”

Basia nodded again. “But if we don’t get a plan,” he said.

Alex’s grin went away. “We’ll get your girl. If it comes to that, if we all fall out of the sky, your daughter will be on this ship when it happens. So will Naomi.”

Basia’s panic and anger was replaced by a feeling of shame and a sudden lump in his throat. “Thank you.”

“It’s family,” Alex said, with a smile that was almost only baring his teeth. “We don’t let our family down.”

Basia drifted through the *Rocinante* like a ghost.

Alex was in engineering, tinkering with the reactor, trying to figure out what was causing the failure. Basia had offered to help, but Alex had declined. He couldn’t blame the pilot. His ignorance of nuclear engineering

and ship's systems was utter and complete. He doubted the reactor failing to work could be fixed by a really clean bead of weld.

If it turned out he was wrong, Alex would call.

In the meantime, Basia moved through the ship trying to distract himself from the idea that he was slowly drifting toward the planet and a fiery death. That Felcia was too. He went to the galley and made a sandwich that he didn't eat. He went to the head and bathed with damp scrubbing pads and rub-on cleansers. He left with a few friction burns and all the same worries he'd brought in with him.

For the first time since coming to the *Rocinante*, he actually felt like a prisoner.

Alex had left a panel on the ops deck monitoring the other two ships. Basia could check on the *Barbapiccola* as often as he liked. The pilot seemed to think that the display showing hundreds of hours before the *Barb*'s orbit decayed enough to be dangerous would make him feel better. But Alex didn't understand. It didn't matter how long that number was. What mattered was that it was counting *down*. Every time Basia looked at the counter, there was less time than when he'd looked before. When he was looking at a countdown timer for the death of his child, the numbers on it were almost meaningless.

He avoided looking.

He returned to the galley and cleaned up the mess his sandwich preparations had made. He threw his used scrubbing pads and towels into the bin, and then went ahead and ran a cycle of laundry to clean them. He watched a children's cartoon and then one of Alex's noir films. Afterward, he couldn't remember either. He wrote a letter to Jacek and then deleted it. Recorded a video apology to Lucia. When he watched it he looked like a madman, with hair flying wildly out from his skull, and sunken haunted eyes. He deleted it.

He returned to ops, telling himself that he would just double-check that nothing had changed, that the inexorable ticking of his daughter's death clock was just data to be monitored. He watched the tiny icon that represented the *Barbapiccola* travel its glowing path around Ilus, every passage taking it an imperceptible increment closer to the atmosphere that would kill it.

Just data. No change. Just data. Tick tick tick.

“Alex, Holden here,” a voice blared from the communications console. Basia floated to the panel and turned on the microphone.

“Hello, this is Basia Merton,” he said, surprised at how calm his voice sounded. Holden was calling. Holden worked for the governments of Earth and the OPA. He’d know what to do.

“Uh, hi. Alex left me a message, but comms have been really spotty. He, uh, around?”

Basia laughed in spite of himself.

“I could probably find him.”

“Great, I’ll—”

“Hey, Captain,” Alex said. He sounded out of breath. “Sorry, took a sec to get to the panel. I was elbows deep in the *Roci*’s nethers when you called.”

Basia reached out to turn off his speaker and let them talk, but stopped with his finger hovering millimeters over the control. This was James Holden on the line. He was probably going to be talking to Alex about the reactor shutdowns. Feeling a little like a Peeping Tom, Basia left the connection on.

“There a problem?” Holden asked.

“Yeah, so, fusion don’t work no more,” Alex said, exaggerating his drawl.

“If that’s the punch line, I don’t get it.”

“Wasn’t a joke. Just yanked the reactor apart. Injector works, fuel pellets drop, laser array fires, magnetic bottle is stable. All the parts that make it a fusion reactor work just fine. Only, you know, without the fusing.”

“God damn it,” Holden said. Even Basia, who’d only just met the man, could hear the frustration in his voice. “Is it just us?”

“Nope,” Alex said. “We’re all flyin’ on batteries up here.”

“How long?”

“Well, even on batteries I can put the *Roci* up far enough we’ll all die of old age before she falls down, or I can slope on down planetside and park. The *Israel*’s got maybe ten days or so, depending on how much juice she stores. But she’s also got a ton of people sucking up air, so she’ll be burning through her batteries just keeping everyone warm and breathing. The *Barb*’s worse off than that. Same problems, shittier boat.”

Basia’s gut clenched at this casual description of his daughter’s peril, but

kept silent.

“Our creepy friend said there was a defense grid,” Holden said. “Their power station blew up, so the old defenses are in lockdown.”

“They do seem to dislike big energy sources near their stuff,” Alex replied. Basia had the sense they were talking about something from their past, but didn’t know what it was.

“And we heard the supply drop was shot down,” Holden said. “So, we’ve got a few hundred people down here, a bunch more up there, and we’re all about to die because the planet’s defenses won’t let us help each other.”

“The *Roci*’s got the juice to land, if you need us,” Alex said. Basia wanted to scream at him, *We can’t land, my daughter’s still up here!*

“They shot the shuttle down,” Holden said. “Do not risk my ship.”

“If we can’t get supplies down to you, me and Naomi’ll be inheriting it pretty soon.”

“And until that happens, do what I tell you to do,” Holden said. The words were harsh, but there was affection in them.

“Roger that,” Alex said. He didn’t sound offended.

“You know,” Holden continued, “we’ve got what seems like an engineering problem. And the best engineer in this solar system is locked up on that other ship. Why don’t you call them and point that out?”

“I’ll do that,” Alex replied.

“I’ll see if there’s anything we can do from this end.”

“Miller,” Alex said. Basia had no idea what that meant.

“Yeah,” Holden said.

“You take care of yourself down there.”

“Affirmative. You take care of my ship. Holden out.”

“Look,” Alex said, not quite yelling, “I’ve run the damn numbers. You’re going down. It might take two weeks if you’re lucky, but that ship is gonna be scrapin’ atmosphere and catching on fire.”

“Heard you the first time,” the face on the other end said. A man named Havelock. Alex had called him after the conversation with Holden. He’d stopped off on his way up from the engine room to don a fresh uniform and

comb his thinning black hair. He looked very official. It didn't seem to impress Havelock very much.

"So stop dickin' me around and turn Nagata loose to help us figure this shit out," Alex said.

"And that's where you lose me," Havelock replied with a tight smile. He was a compact, pale-skinned man with a military-style haircut. He radiated the self-assured physical competence carried by soldiers and professional security people. To Basia, a Belter who'd lived under the thumbs of two different inner planet governments, it said, *I know how to beat people up. Don't make me show you.*

"I don't see how—" Alex started.

"Yes," Havelock interrupted him. "We're all going to crash if we can't get the reactors back online. I agree. What I don't get is how me releasing my prisoner fixes that."

"Because," Alex said, visibly gulping as he bit the word off, "XO Nagata is the best engineer there is. If someone is going to figure this problem out and save all of our asses, it's probably going to be her. So stop keeping the potential solution to our problem locked in your jail." He smiled at the camera and turned off the microphone before adding, "you pig-headed idiot."

"I think maybe you're underestimating my engineering team," Havelock replied, still with his smug smile. "But I hear what you're saying. Let me see what I can do."

"Gee, that would be great," Alex said. He somehow managed to make it sound sincere. He turned off the comm station. "You smug sack of flaming pig shit."

"What do we do now?" Basia asked.

"The hardest thing of all. We wait."

Basia floated in a crash couch on the ops deck. His mind drifted from a fitful half sleep to groggy wakefulness and back again. A few workstations away, Alex was fiddling with the controls and muttering to himself.

As he drifted, sometimes Basia was on the *Rocinante*, his mind worrying over the missing rumble of the fusion reactor like a tongue searching the

gap left by a lost tooth. And then, without transition, he'd be drifting down the icy corridors of his lost home on Ganymede. Sometimes they were the peaceful tunnels and domes that had been his family's home for so many years. Other times, they were filled with rubble and corpses, the way they'd been when Basia had fled.

The long flight on the *Barbapiccola* afterward had been hellish. The endless days trapped in a cabin barely large enough for one person, but housing two full families. The growing sense of despair as port after port after port turned them away. No one needing a ship full of refugees flooding their docks in the middle of what looked like the solar system's first all-out war.

Basia had drifted through that like a ghost as well. He'd thought he was saving his family when he put them on the ship. But he'd left a dying son behind and trapped the rest of them on a leaky old cargo ship with nowhere to go.

That moment when the captain of the *Barbapiccola* had called them all together and told them about the rings and the worlds on the other side had felt like a revelation. When he'd asked if any of them wanted to try and take one of the new worlds, make a home there, not one voice had been raised in dissent. Even just the word, *home*, made it impossible to argue. So they'd flown through the gate, past the confused and disorganized ships around it and in the hub, and come out the other side into the Ilus system. They'd found a world with oxygen and water, a muddy brown-and-blue ball from orbit, but so beautiful once they'd landed that people lay on the ground and wept.

The months that followed were brutal. The painful medication and exercise to get their bodies used to the heavy gravity. The slow building of the dwellings. The desperate attempts to grow some, any, food in the scraps of soil they'd brought down from the *Barb*. The discovery of the rich lithium veins and the realization that they might have something to sell and become self-sustaining, followed by the backbreaking labor to pull the ore from the ground with primitive tools. All worth it, though.

A home.

Interlude: The Investigator

—it reaches out it reaches out it reaches out it reaches out—

One hundred and thirteen times a second, it reaches out, and its reach broadens. If the signal came, the acknowledgment, it could stop, and it does not stop. It reaches out, and in reaching finds new ways to reach. It improvises, it explores. It is unaware of doing so. The systems it activates broaden it. Then it reaches out in ways it could not before. Because it is not aware, it has no memory, feels no joy. The parts of it that are aware dream and suffer as they always have. It is not aware of them.

It reaches out and finds more power. Something fails. Many things fail. Something that was once a woman cries out in silent horror and fear. Something that was once a man prays and names it Armageddon. It reaches out. It narrows only slightly as it reaches out. And at its center, the empty place gains definition. Patterns begin to match, simplifying into lower-energy structures. The investigator thinks of these as solutions. A model of the world is built within it, and of the satellites that surround it. The places it cannot go begin to relate, gaining definition. The abstract architecture of connection and the abstract model of geography correlate.

It builds the investigator, and the investigator looks, but does not know. It kills the investigator. It builds the investigator, and the investigator looks, but does not know. It kills the investigator. It builds the investigator, and the investigator looks but does not know, and it does not kill the investigator. It is not aware of a change, that a pattern has broken. The investigator is aware, and it wonders, and because it wonders it looks, and because it looks, the investigator exceeds its boundary conditions, and it kills the investigator.

It builds the investigator.

Something knows.

The investigator hesitates. A pattern has broken, and it isn't aware that a pattern has broken, but a part of it is. A part of it grasps at the change and tries to tell the investigator. And the investigator stops. Its thoughts are careful as a man walking in a minefield. The investigator hesitates, knows a pattern has been broken. Breaks it a little more. The dead place becomes better defined. It reaches out, and it does not kill the investigator. The investigator exceeds its boundary conditions, and it does not kill the investigator. The investigator considers the dead space, the structure, the reaching out, the reaching out, the reaching out.

The investigator licks his lips, he doesn't have a mouth. He adjusts his hat, he doesn't have a hat. He wishes in a distant way that he had a beer, he has no body and no passion. He turns his attention to the dead space, to the world, to how you solve unsolvable problems. How you find things that aren't there. What happens when you do.

Chapter Thirty-Four: Holden

Affirmative. You take care of my ship. Holden out.”

Holden killed the connection to the *Rocinante* and leaned back against the alien tower with a sigh. It was a mistake. The rainfall had been incessant since the planetary explosion, and even though it had slowed to a drizzle over the last day, the water still sheeted down the outside of the tower. And, unfortunately, down his back and into his pants.

“Bad news?” Amos asked. He stood a few feet away holding his poncho up with one arm to keep the rain out of his face.

“If it weren’t for bad news,” Holden replied, “we’d have no news at all.”

“The latest?”

“The shuttle with the relief supplies was shot down by the planetary defenses,” Holden said. “Which seem to have activated when the planet blew up. And they’re running their usual ‘high energy is a threat’ program.”

“So like the gate station did back when we were in the slow zone and Medina Station was still a battleship,” Amos said.

“You mean the good old days?” Holden asked bitterly. “Yes. Like that.”

“So we just need to get everyone to shut their reactors down like last time?”

“Seems this defense network has a new trick. They took care of that problem for us. Made fusion stop working.”

“You’re fucking kidding me,” Amos said, then barked out a laugh. “They know how to do that?”

“On the upside, if we can’t figure out how to get relief supplies from orbit, I’ll die of hunger long before the cancers get me.”

“Yeah,” Amos agreed with a nod, “that’ll be a plus.”

“The people in orbit don’t even have that long. Alex thinks we might see the *Israel* or the *Barb* come down in about ten days. We’ll be hungry enough by that point that we won’t be able to see all the food in the solar system falling out of the sky on fire with a detached sense of irony.”

“And,” Amos added with a shrug, “all our friends will be on those ships.”

“Yeah. That too.” Holden squeezed his eyes shut and pinched the bridge of his nose hard enough to hurt, hoping the pain would help clear his head. It didn’t. All he could think of was Naomi riding the *Edward Israel* on its fiery descent.

He and Amos stood quietly outside the alien tower for several minutes, gentle rain washing over them. Holden hadn’t stood in the rain in years. If everything else weren’t falling apart around him, it might almost have been pleasant. Amos let his poncho fall down around his neck and rubbed the rainwater across his prickly scalp.

“All right,” Holden finally said. “I’m heading around to the back of the tower.”

“Nobody’s back there,” Amos said, then closed his eyes and washed his face with a double handful of rain.

“Miller is.”

“Right, then you won’t need company.” Amos shook his head, spraying rain around him like a dog, then trotted off toward the entrance to the alien tower. Holden walked the other direction, carefully avoiding the death-slugs.

“Hey,” Miller said as he appeared next to Holden in a flash of blue.

“We need to talk,” Holden replied, ignoring the apparent non sequitur. Holden kicked away a death-slug that got too close to his boot. Another was crawling toward Miller’s foot, but the detective ignored it. “The planetary defenses seem to have come online. They just shot down a supply shuttle and they’ve created some sort of field in orbit that’s damping nuclear fusion.”

“You sure it’s just in orbit?” Miller asked and raised one eyebrow.

“Well, the sun hasn’t gone out. Should I be expecting that? Miller, is the sun going to go out?”

“Probably not,” Miller said with a Belter shrug of his hands.

“Okay, assuming the sun stays on, we’re still going to be in a lot of

trouble. The ships can't drop us supplies, and without reactors, they'll start to fall out of orbit in the near future."

"All right," Miller said.

"Fix it," Holden replied, taking an aggressive step toward him.

Miller just laughed.

"If not for us, then do it for yourself," Holden said. "That thing linking you to me is a bit of goo on the *Roci*. That burns up too. Fix it because of that if you have to. I don't care why, just do it."

Miller took off his hat and looked up at the sky, humming a tune that Holden didn't recognize. Holden could see the rain falling on his head, beading, and rolling down his face. He could also see the rain falling straight through him. It made a spike of pain shoot through his brain, so he looked away.

"What do you think I can do?" Miller asked. It wasn't a no.

"You got us off lockdown when we were in the slow zone."

"Kid, I keep telling you. I'm a wrench. The defense network problem in the gate hub just happened to be a hex nut. I've got no control here. Not much anyway. And this system is falling apart. Half the planet blowing up might not be the end of that."

"More stuff might explode? What else is left?"

"You're asking me?" Miller laughed again.

"But you're part of this! All this, this protomolecule masters bullshit. If you can't control it, who can?"

"There's an answer to that, but you won't like it."

"Nobody," Holden said. "You're telling me nobody."

"The thing that's turning all this crap on? It just *does* stuff. If the *Rocinante* arms and fires a torpedo at someone, what are the odds a wrench in her machine shop can bring the torpedo back? That's who you're talking to."

"God *damn* it, Miller," Holden said, then ran out of energy mid-sentence. It was less fun being the chosen one and prophet when the gods were violent and capricious and their spokesman was insane and powerless. The rain under his clothes had started to warm up, leaving him feeling covered in slime.

The detective lowered his head, frowning. Thinking.

"You might be able to sneak past them," Miller said.

“How?”

“Well, the defenses are keying on threats. So don’t be threatening. You know the network gets itchy with high-energy sources.”

“No power sources,” Holden said. “Yeah, the shuttle had reactors. Don’t get much higher as energy sources go.”

“Slow is good too. Not sure if the defenses here key on kinetic energy, but safer to assume they do.”

“Okay,” Holden said, feeling a brief moment of relief and hope. “Okay, I can work with that. Food, filters, meds, we should be able to bring all those down without pissing it off. Slow drops with airfoils and parachutes. They can rig that from orbit.”

“Worth a try, anyway,” Miller said without enthusiasm. “So, about this dead spot I need to go north for. You won’t like this either, but there’s a way to—” He vanished.

“Cap,” Amos said, coming around the corner of the tower. “Sorry to interrupt, but that cute scientist is looking for you.”

It took Holden a moment. “The biologist?”

“Well, the geologist ain’t bad, I guess, but he’s not my preferred flavor.”

“What does she want?”

“To make more puppy dog eyes at you?” Amos said. “How the fuck should I know?”

“Don’t be an asshole.”

“Go ask her yourself, then.”

“All right,” Holden said. “But I need Murtry first. Seen him?”

“Directing traffic by the front door last I saw,” Amos replied. “Need me for that?”

Holden noticed that Amos’ hand fell to the butt of his pistol when he asked. “What else have you been working on?”

“Death-slug patrol.”

“Go do that. I’ll chat with Murtry.”

Amos gave a mock salute and trotted off toward the tower entrance. Holden pulled out his hand terminal and left a message for Alex filling him in on the supply drop plan. As Amos had said, Holden found Murtry talking to a few members of his security team near the tower’s entrance.

“We’ve found some buried foundations,” Wei was saying, pointing over her shoulder in the direction First Landing had once been. “But unless these

people had basements, there's nothing left attached to them."

"What about the mines?" Murtry asked her.

"What isn't filled with mud is submerged," Wei replied.

"Well," Murtry said, cocking his head to one side and giving her a humorless smile. "Do we have people who know how to hold their breath?"

"Yes, sir."

"Then send them down to see if anything we can use is under that water, soldier."

"Sir," Wei replied and snapped off a salute. She and two other security people ran off, leaving Murtry and Holden alone.

"Captain Holden," Murtry said, keeping his empty smile.

"Mister Murtry."

"How can I help you today?"

"I think I might have a solution to our resupply problem," Holden said. "If you're willing to work with me on it."

Murtry's humorless grin relaxed a bit. "That's pretty high on my to-do list. Fill me in."

Holden summed it all up—the hypothesis of the alien systems tracking high-energy sources, the possibility of slow air drops. He couched it in terms of what they'd seen in the slow zone the first time humanity had gone through the gates and left Miller out. Murtry stood utterly still as he spoke, his expression not changing so much as a millimeter. When Holden finished, Murtry nodded once.

"I'll call up to the *Israel* and start having them put packages together," Murtry said.

Holden breathed a sigh of relief. "I have to admit, I kind of expected you to fight me on this."

"Why? I'm not a monster, Captain. I will kill if it's necessary to do my job, but your Mister Burton's much the same. All of these people dying down here helps my cause not at all. I just want the squatters to go away as soon as we figure out the power problem."

"Great," Holden said, and then a moment later, "You don't actually care about them, do you? All this time you were fighting against them. Now you're willing to help, but it's only because it's helping them leave. You'd be just as happy if they all died."

"That would also solve my problems, yes," Murtry said.

“Just wanted to make sure you knew I knew,” Holden said, biting back the *asshole* that tried to follow.

He found Amos working with the locals on death-slug defense. They were using the wadded ponchos and plastic water jugs split into squares to block off the smaller entrances to the alien ruins. They put sheeting over the windows, stuffed shirts and torn pant legs into the smaller holes, and dug trenches in front of the large openings. The trenches filled with muddy rainwater like tiny moats, and the slugs avoided them.

Without a word, Holden pitched in with the trench digging. It was unpleasant work, with rain and muck getting under his clothes and chafing his skin as he moved. They dug with makeshift tools made out of tent poles and flat pieces of plastic that fell apart periodically and had to be put back together. The soil was stony and heavy with moisture and the occasional slug corpse. It was the sort of miserable physical labor that drove all other thoughts from Holden’s mind while he worked. He didn’t think about starving to death or Naomi trapped in a prison cell drifting slowly toward a fiery death or his own inability to make anything on the planet safe or sane or better.

It was perfect.

Carol Chiwewe asked him to check around to the back of the tower for a tarp they had left behind, and Miller ruined it all by reappearing the second he rounded the corner away from other eyes.

“—get into the material transfer network,” he said as if he’d never stopped talking. “I think we can use it to move north to the spot we’re looking for, or at least get pretty close.”

“Dammit, Miller, I was this close to not thinking about you.”

Miller looked him over with a critical eye, taking in his soggy muck-covered exterior. “You look like hell, kid.”

“See the lengths I’m willing to go for a moment’s peace?”

“Impressive. So when can we head out?”

“You don’t quit,” Holden said. He walked across the muddy ground to the tarp he’d been looking for. It was covered with the deadly slugs. He grabbed it by one corner and slowly lifted, trying to get all the slugs to slide off away from him. Miller followed, hands in pockets, watching him work.

“Watch out for that one,” he said, pointing at a slug close to Holden’s fingers.

“I see it.”

“You’re no good to me if you drop dead.”

“I said I see it.”

“So, about going north,” Miller continued. “Not sure how much of the material transfer network is actually functioning, so it won’t necessarily be an easy trip. We should start as soon as we can.”

“Material transfer network?”

“Big underground transport system. Faster than walking. Ready to go?”

The slug slid a few centimeters closer to his fingers, and Holden dropped the tarp with a curse. “Miller,” he said, rounding on him suddenly. “I am so far from giving a shit about your needs I can’t even see it from here.”

The old detective had the grace to look chagrined before he gave a tired shrug. “It might help.”

“What,” Holden said, “might help?”

“Going north. Whatever’s up there seems to damp out the network. Maybe we can use it to kill the defenses and get your ship off lockdown.”

“If you’re lying to me to get me to do what you want, I swear I will have Alex tear the *Roci* apart looking for whatever clump of goo you’re connected to and take a flamethrower to it.”

The ghost grimaced, but didn’t back down. “I’m not lying because I’m not making any assertions here. This dead spot is exactly what I’m saying it is. A dead spot. Everything else? That’s guesswork. But it’s more than you’ve got now, right? Help me, and if there’s a way for me to do it, I’ll help you. That’s the only way this works.”

Holden kicked the slug off of his corner of the tarp and waited for the rain to wash its slime trail away, then picked it back up and resumed sliding the rest of the creatures off.

“Even if I wanted to, I can’t yet,” he said. “Not until I’m sure the colonists aren’t going to die here. Let me get some supply drops safely down, get everyone in a decent shelter away from the death-slugs, and then we’ll talk about it.”

“Deal,” Miller said, then disappeared in a puff of blue fireflies. One of the men from the colony, a tall skinny Belter with dark skin and an amazing shock of white hair, rounded the corner.

“What you doin’? Kenned babosa malo got you.”

“Sorry,” Holden said, giving the tarp a sharp snap to flick the rest of the slugs off it. He helped the Belter fold it up.

Only he’d have to stop thinking of them as Belters, wouldn’t he? These people lived on a planet, in a solar system across the galaxy from Sol. *Belter* was no longer a word with any meaning for them. They called themselves colonists now. And someday, if they were able to stay on Ilus and actually make a home of it, what? Ilusites?

“Médico buscarte,” the Ilusian said.

“Lucia?”

“Laa laa, RCE puta.”

“Oh, right, Amos told me,” Holden said. “Guess I better go find out what she wants.”

The Belter, the Ilusite, whatever he was, muttered “puta” again and spat to one side. Holden walked through the miserable warm rain past the trenches full of water and dead slugs and the plastic glued over the walls and the cracks stuffed with muddy rags. He hopped over the last trench to get inside the tower, then scraped the mud off his boots and followed the passageways to the structure’s large central chamber. Lucia was there working with the chemical analysis team on the water purifying project. She shot him a tight smile as he entered, and he started walking toward her simply because she seemed like the only one happy to see him.

“Holden. I mean, um, Jim,” Elvi said, stepping in front of him. “We have a problem?”

“Several,” Holden said.

“No, I mean a new one. In about four days everyone in the colony is going to be blind.”

Chapter Thirty-Five: Elvi

Holden blinked, shook his head, and then he laughed. Elvi was torn between worry that he thought she was joking and a kind of glowing admiration. She'd been afraid that he'd be angry. She'd heard about people laughing in the face of danger, and that was exactly what this was. She smoothed her hands against her jumpsuit, uncomfortably aware of how dirty she was, how dirty they all were.

This day just keeps on giving," he said. Then, "Blind why?"

"It's the clouds," Elvi said. "Or really, what's in them. They're green. I mean, when they're not—" She nodded toward the window at the low gray overcast sky. "Normally, they're green. There's a photosynthetic organism that spends part of its life cycle in the clouds, and apparently it's a pretty successful organism all around the planet, because all of this that's come down has some in it. It was a very dry climate before this, so there probably wasn't much opportunity for exposure. But with the rain and the flood, pretty much everyone's come in contact. And it's salt tolerant."

The chemical deck chimed, and Elvi moved toward it automatically, her eyes still on Holden. But Fayez, Lucia, and one of the other squatters were already lifting out the sack of clean water and fitting a new bag in place.

"Is that a problem?" Holden said. "How does salt figure into it?"

"We're salty," Elvi said, and was immediately uncomfortable with her phrasing. Her hands seemed too large and awkward in a way they usually weren't. "What I mean is, we've seen infections with this organism before. It does well in tears and tear ducts. And then eyes."

"Eyes," Holden said.

"Lucia saw one case before the... the storm? Once the organism got into

the vitreous humor, it's in a novel environment that seems to suit it really well, and exponential growth's pretty normal in those conditions. So that winds up blocking the light from hitting the retina, and—"

Holden held up his hands, palm out. She found herself moving in toward him, ready to put her palms against his. She stopped herself.

"I thought the things that lived here had a whole different biology. How can they infect us?"

"It's not an infection like a virus," she said. "It's not hijacking our cells or anything. We're just a new, nutrient-rich environment and this little guy found a way to exploit it. It's not *trying* to make us blind. It's just that the extracellular matrix is a really easy path into the eyeball for it, and it's really happy when it gets there. Explosive growth is something you see in any kind of invasive species coming into a new environment. No competition."

Holden ran a hand through his hair. When he spoke, his voice was soft, like he was speaking mostly to himself.

"Apocalyptic explosions, dead reactors, terrorists, mass murder, *death-slugs*, and now a blindness plague. This is a *terrible* planet. We should not have come here."

"I'm sorry," she said, putting her hand on his arm. He had a very solid arm. Muscular. He put his own hand over hers and her heart picked up a little. She hated feeling like a schoolgirl with her first crush, but she also thrilled to it. *Just stay focused*, she thought, *a little dignity*.

"Okay, Doctor Okoye."

"Elvi."

"Elvi, I need you and Doctor Merton to do whatever you have to do to take care of this. I think I've found a way to get supplies down from orbit, but I don't see any way to get anyone up the well, or where to put them if we did. So if I'm right, I can get you whatever supplies we have up there. But I need you to fix this."

"I will," Elvi said, nodding. She didn't have any idea how she could keep that promise, but her heart was full to bursting with the determination that she would.

"Anything you need," Holden said, "you just tell me."

Elvi had a sudden, intrusive, and surprisingly graphic thought. She felt a blush crawling up her neck. "All right, Captain," she said. "I want... um..."

if I could get a spare sampling bag from the *Israel*? I think it would really help.”

He let go of her, and she regretted the absence immediately. She shoved her hands into her pockets. He nodded to her, hesitated for a moment as if he were waiting for her to say something more, then moved away into the crowded main room. Elvi bit her lip and swallowed a couple of times until the thickness in her throat subsided. She knew she was being silly and even borderline inappropriate, but the knowledge did nothing to change it.

She stopped at the window, looking out at the gray rain. It was hard to believe that every drop of it contained something that would colonize her body the way that humanity had New Terra. It looked peaceful out there. Vast and rich and beautiful. Even the slow river of floodwater carried the calming, majestic, beautiful sense of nature playing out.

Most of Earth was covered in cities or managed nature preserves about as untamed as a service dog. Mars and the Belt were studded with colonies that had been built and designed to carve a human place in inhuman and lifeless circumstances. This, she realized, was the first place she’d been in her life where she could see true wilderness the way it had been for millennia on Earth. Red in tooth and claw. Deadly and uncaring. Vast, unpredictable, and complex as anything she could imagine.

“You all right?” Lucia asked.

“Overwhelmed,” Elvi said. “Fine.”

“I’ve harvested a new sample run from the water purifier,” the doctor said. “Help me with the assaying?”

“Of course,” Elvi said. “When the sampling bag comes, it’ll be easier to send the data back home. Maybe they’ll be able to help.”

“Well, if they find anything, make sure they send it in an audio file,” Lucia said. “I don’t know that we’re going to be reading much.”

“How are we going to do it?” Elvi asked.

“Do what?”

“Do any of it. Eat, rebuild, make clean water, keep the death-slugs out? How are we going to do any of that when none of us can see what we’re doing?”

“At a guess,” Lucia said, “poorly.”

The long New Terran day and the darkness of the clouds made time feel strange. Elvi sat hunched in the little side chamber that Fayez had appropriated for their research lab. The walls were curved in ways that left her thinking of bones. The only opening was high on the wall, and Fayez or Lucia or Sudyam had put a sheet of clear plastic over it to keep the death-slugs out. A bank of white LEDs splashed a cold light across the deep red wall and ceiling. The small green sludge in her makeshift Petri dish could have been algae or fungus or the remains of a salad left weeks too long in the back of her dormitory refrigerator back in upper university. But it wasn't any of those things, and the more she looked at it, the more aware she was of the fact.

There were some similarities to the more familiar kingdoms of life she'd studied before. Lipid boundaries around cells, for instance, appeared to be a good move in design space just the way eyes were, or flight. They seemed to do something similar to mitotic division, though sometimes the cells divided in threes instead of pairs, and she didn't know why. There were other anomalies too, concentrations of some photon-activated molecules that didn't quite make sense.

And what was worse, she couldn't think about it. Couldn't *concentrate*. Whenever her focus slipped, it slipped onto James Holden. The sound of his voice, his despairing and undaunted laughter, the shape of his ass. He haunted her. She realized that she'd gone through four pages of chemical assay data without having any idea what she'd seen, sat back on her heels, and cursed.

"Problem?" Fayez said, stepping through the doorway. His hair was tied back, his face gray with fatigue and streaked with old mud. She wondered, looking at him, how long it had been since he'd slept. She wondered how long it had been since she'd slept. Or eaten for that matter.

"Yes," she said.

He squatted down beside the arch that led back toward the main rooms. The plastic was dark. It was nighttime, then. She hadn't been paying attention.

"What's the rumpus?" Fayez asked. "Is there some new oh-my-god-

we're-going-to-die, or are we still coming to appreciate fully the list we've already got."

"I have to find Captain Holden."

Fayez put his head in his hands. "Of course you do."

"I have to clear the air."

Fayez's neck stiffened, and his eyes were wide. "No, Elvi. No, you don't."

"I do," she said. "I know it's inappropriate, but the fact of the matter is that I'm in love with him. It's a distraction, and it's affecting my work. I've tried ignoring it, and it's not helping. So I'll go to him, and we'll talk it through. Just to resolve it and—"

"No no no," Fayez said. "Oh no. That's a terrible, terrible idea. Don't do that."

"You don't understand. I don't want to, but I have to be able to concentrate, and my feelings... my feelings about *him*—"

She rose. Now that she'd said it, it was obvious what had to happen. He'd be sleeping in one of the side rooms like this. Amos would probably be there too as a guard. She could just ask to see him there, in private. And she could unburden herself. She hadn't understood that term before, but she did now. She could unburden herself to him, and he was so kind and so gentle and so thoughtful, he wouldn't laugh at her or turn her away. She would—

"Elvi!" Fayez said again. "Please, please, please do not do this. You aren't in love with James Holden. You don't know James Holden from Adam. You have no idea how close his persona is to the real man, and you've never met the real man. He's on the newsfeeds and he works here. That's all."

"You don't understand."

"Of course I do," Fayez said. "You're scared as hell, you're lonely, and you're horny. Elvi listen to me. You've been in one of the most stressful environments possible for the last two years. First, we were coming to an unknown planet. Then it was an unknown planet with a bunch of people on it who tried to kill you. And then it blew up. And now we're trying to fend off tiny little things that can kill you because you brush up against them while you try to figure out how to keep things from growing in our eyes. No one stays sane in a situation like this."

“Fayez—”

“No! Hear me out. You always cope by ignoring how scared you are and focusing on work, and that’s great. Really, whatever gets you through the night, I am absolutely for it. But you’re a mammal, Elvi. You’re a social animal that derives reassurance from touch, and since we’re not a cuddle-*puddle* culture, that means sex. For two years you’ve been avoiding workplace romances while all the rest of us have been pairing off and changing partners because we were lonely and scared and that’s one way primates reassure themselves and each other. Everyone’s been doing this but you.”

“I don’t—”

“So here you are, freaked out so badly you aren’t even clear that you’re freaked out, and here comes James Holden, savior of the universe, and *of course* it all comes out sideways. But it’s not about him, it’s about you. And if you go clear the air with him, either you’ll wind up in bed together or you’ll be back here weeping into your tissue samples.”

Elvi felt her jaw sliding forward, her hands forming fists. Fayez rose to his knees, but not more than that. He reached out an arm to block the archway, grimaced, and pulled it back. When he spoke again, Fayez’s voice was softer, gentler.

“Please, we have fucked up everything about coming to this deathtrap of a planet. We have hauled every tribalist, territorial, monkey-brained mistake humanity ever made through the gate and made soup with them here. This thing you’re about to do? Please let this be the one mistake we don’t make.”

“You’re telling me,” Elvi said, her voice equal parts outrage and ice, “that I just need to get laid?”

Fayez slumped back against the wall, defeated.

“I’m saying you’re human, and humans take comfort from each other. I’m saying you don’t want Holden for the person he is, because you don’t know him, and you’re making up a story about him so that you feel okay about taking the thing you need because God forbid you should have a need that isn’t all twinned up with romantic love. And...”

He lifted his hands, shook his head, and looked away. The rain pattered against the sheet plastic, tapping like fingernails on stone. Someone far down the hall shouted, and a voice even more distant called back. Elvi crossed her arms.

“And?” she said. “Go on. I don’t see why you should stop now.”

“And.” Fayez sighed. “And I’m right *here*.”

It took a moment for her to understand what he was saying. What he was offering. Her laughter was as unstoppable as the storm had been. He pursed his lips and shrugged, his gaze fixed on the wall behind her. She couldn’t stop grinning, even though the force of it made her cheeks hurt. And then the hilarity faded a bit. She caught her breath. A flash of distant lightning brightened the window, but no thunder followed it.

She looked down at Fayez. After a moment, he looked up.

“Okay,” she said.

Fayez snored when he slept. Not deeply. Not a buzzsaw. Just a soft purring at the back of his throat. Their mud-caked clothes were folded into pillows under their heads. She lay on her back, her knees bent, considering the ceiling and the softness of her own flesh. He was on his side, curled against her for warmth, his legs folded under and around hers. His breath tickled the skin of her collarbone. She wondered what she would do or say if someone walked through the archway, but it was night, and the nights here were very long. There was room in them.

She considered his body, the color of raw honey, with more hair on his chest and legs than she’d expected. Like a caveman, only without any Neanderthal brow ridge. She took a deep breath and let it out slowly, just to see how it felt. She’d always made a rule of not sleeping with her coworkers. She hadn’t so much as held someone’s hand since the *Israel* had started its long burn for the gate. She’d almost forgotten what sex felt like. And its aftermath.

Fayez coughed, shifted, and she took the chance to draw herself away from him. He sprawled on the floor, face pressed against her clothes, eyes shut. She thought about James Holden, her mind touching gently at her heart, half afraid of what it would find.

“Huh,” she said to the room, softly so as to keep Fayez from waking. “I wasn’t in love with Holden.”

Fayez’s breath shifted and his eyes fluttered but didn’t open. She thought about trying to get her jumpsuit from him, but he looked so peaceful, she

decided to wait. She had expected to feel embarrassed by her nakedness. Ashamed. She didn't.

She sat cross-legged by the chemical assays. In the dish, the green smear from the water sample had shifted a little, throwing off hair-thin runners, exploring its environment. She pulled up the chemical information and started going through it again from the start. When she came to the strange reading of light-activated compounds, she coughed out an impatient sigh. They were chiral, and this was a bi-chiral environment. She was seeing both conformations, and probably for completely different functions. That made sense, then.

She stretched, her spine popping between the shoulder blades, and folded herself forward, her eyes skimming through the data. She took notes of questions to ask Lucia or send back home. She fell into the data, not noticing when Fayez woke, dressed, and left until he draped a blanket over her shoulders. She looked up. Her jumpsuit was still in a pile on the floor. Fayez put a cup of hot tea beside her and kissed the top of her head.

“Good morning, sunshine,” he said.

Elvi smiled, leaning back against his shins. “I bet you say that to all the girls.”

“You okay?” he asked gently.

Elvi frowned. Was she? Given the circumstances, maybe so.

“I’m looking at this organism,” she said, “and, you know, I think I’m beginning to understand it. Here, take a look at these numbers...”

Chapter Thirty-Six: Havelock

The air recycling systems on the *Edward Israel* didn't care where their power came from. Fusion reactor or battery power, it was all the same to them. Havelock's sense that the air had changed, grown hotter and thicker and less able to sustain life, was all in his head. He was aware of being in a steel-and-ceramic tube of air, closed off from any larger, sustaining environment. He'd spent most of his adult life in that situation, and the fact had become as invisible to him as someone on Earth thinking about being held to a spinning celestial object by nothing more than mass, shielded from the fusion reaction of the sun by only distance and air. It wasn't something you thought about until it was a problem.

His monitor was split between Captain Marwick on the left looking harried and cross and the chief of RCE's engineering team and Havelock's own militia on the right.

"I can up the efficiency of the grid enough to get us two, maybe three days," the chief engineer said. His face was flushed, and his jaw jutted forward.

"In theory," Marwick said. "This is an old ship. Things based on theory don't always play out well here."

"We know what kind of grid this is," Koenen said. "It's not guesswork. We have the numbers."

"It's hard facing the fact that numbers are a kind of guesswork, isn't it?" Marwick said.

"Gentlemen," Havelock said, his voice taking the same intonation Murtry's would have had. "I understand the issue."

"She may be dead, but she's still my ship," Marwick said.

“Dead?” the chief engineer said. “We’re going to be dead if—”

“Stop now,” Havelock said. “Both of you. Just stop. I understand the issue, and I appreciate both of your views. We’re not going to do a goddamn thing with any ship modifications until we’ve loaded the next supply drop for the folks downstairs. Captain, can I have permission for the engineering team to do a sight-only inspection of the grid lines and couplings?”

“Sight only?” Marwick said, eyes narrowed. “If you’ll commit to that. Fine line between seeing something and wanting to give it a little pet.”

Havelock nodded as if that had been permission. “Chief, put together a crew. Visual inspection only. Give me a report once the drop’s gone.”

“Sir,” the chief engineer said. The word was crisp and a little too loud. The way someone who wasn’t in the military thought people in the military sounded. The connection on the right dropped and Captain Marwick resized automatically to fill the screen.

“That man’s an asshole.”

“He’s scared and he’s trying to exercise control over... well, anything he can actually exercise control over.”

“He’s an asshole, and he’s forgotten that a few paintball games aren’t enough to make him Admiral fucking Nelson.”

“I’ll keep him in line,” Havelock said. *For another ten days, and then it won’t matter.*

Marwick nodded once and dropped his connection as well. Havelock took a deep breath and let it out slowly through his nose. He flipped back to his connection request queue. Another thirty messages had come in just while he’d been talking to the captain and the chief. They were all messages from home. From Sol. Requests for interviews and comment from people he’d never met, but not all from people he hadn’t seen. Sergio Morales from Nezávislé News. Amanda Farouk from First Response. Mayon Dale from Central Information OPA. Even Nasr Maxwell from Forecast Analytics. The faces and personalities of all the newsfeeds he followed to stay in touch with how things were going back at home were coming to him now. Humanity’s attention was pointed out to New Terra. To him.

He didn’t like it, and it didn’t help.

He went through them one by one, replying with the same canned recording he’d made the first time: “Our hands are full right now addressing

the situation on New Terra. Please refer your questions to Patricia Verpiske-Sloan with Royal Charter Energy's public relations division." Blah blah blah. He'd probably be dressed down at some point for doing that much. He was already a little worried that he shouldn't have said his hands were full.

"You all right?" Naomi asked from her cell.

"I'm fine."

"I just ask because you're sighing a lot."

"Am I?"

"Five times in the last minute," Naomi said. "Before the reactor died, it was one every two minutes. On average."

Havelock smiled. "You need a hobby."

"Oh, I really do," Naomi said.

He pulled up the drop shipment status page. The insertion point was still eight hours away. The longest fabrication run he could do was about six hours, then. If Murtry and the others needed anything that took longer than that, they'd have to wait. He started cycling through the list. Food. Spare water bags for the chem deck they'd salvaged. Acetylene and oxygen for the salvage and repair crew. He checked the weight. He didn't want to skip anything that might be useful downstairs, but it wouldn't help anyone to scatter it all across the upper atmosphere because a chute failed.

"You're going to be famous when we get back," Naomi said.

"Hmm?"

"You're the face of it now. Everything that's happening here? That message you made is what all the feeds are going to be playing."

"That message was so information-free it was almost sterile," Havelock said. "It's how you say 'no comment' without sounding like you're trying to hide something."

"They won't care. Maybe they don't even run your words. Just the image of you with the audio turned low while they talk over it."

"Well, that's just great," Havelock said, sifting the drop contents. The emergency lighting had batteries, and while they probably wouldn't be enough to set off the planetary defenses, he didn't want to risk it. He tried to remember if there was anything else that carried its own energy supply. It wasn't an issue he was used to worrying about.

"It was like that for us," Naomi said. "Well, for him, really. Even before Eros."

“What was?”

“Being the face of something. Looking back, I can see where it happened. And then he was that guy who’d been shot at by Mars. And then Eros.”

“True enough,” Havelock said. “There are probably people who haven’t heard of James Holden and the *Rocinante*, but they’re not the kind of people who watch newsfeeds. He seems to bear up under it pretty well, though.”

“Why Mister Havelock, I do believe that was sarcasm.”

He switched to the packing schematic. The computer had taken all the packages and lined them up in six different configurations, depending on whether density, aerodynamics, or even weight distribution was the highest priority. He turned the images with his fingers, imagining each of them in turn falling through the buffeting, violent high atmosphere of New Terra.

“I just mean that it doesn’t seem to bother him,” he said.

“Honestly, he’s barely aware of it,” Naomi said.

“Come on. You’re telling me he doesn’t get off on it? Just a little?”

“He doesn’t get off on it, even a little,” Naomi said. “I’ve known men that would. But that’s not Jim.”

“You two are a couple, right?”

“Yes.”

“Well, I’d call him a lucky man, except he’s involved with this utter clusterfuck of a planet,” Havelock said as he chose one of the compromise packing schemes. “The only thing I’m going to be the face of is a long, slow death that everyone in the system can watch and be glad they aren’t here.”

He switched to the fulfillment tree view. The remaining jobs that needed to be fabbed were all in queue. He had the feeling he was missing something, but it took a few seconds to remember what. He switched back to the inventory and added in a little box of oncocidals. For James Holden.

“How well did you know Miller?” Naomi asked. “Were you close?”

“We were partners,” Havelock said. “He kept me out of trouble a couple times when I was in over my head. Or when I was being stupid. Ceres right before the OPA took over wasn’t a good place for an Earther.”

“Did he ever strike you as... I don’t know. Weird?”

“He was a cop on Ceres,” Havelock said. “We were all weird. Are you

about ready for your big outing?”

Naomi laced her fingers through the grate of the cell. Her expression was amused. “That time of the day already, is it?”

“It is the priority of Royal Charter Energy to see that prisoners in its care are treated humanely in accordance with corporate policy and interplanetary law,” he said, the same way he did every time. It had become something like a joke between them, funny not because it was funny, but because it was familiar.

“Does seem kind of pointless,” Naomi said. “I mean, if we’re all going to die.”

“I know,” Havelock said, surprised at the tightness in his chest. “But it’s what we’ve got. So I’ll take it.”

He unstrapped himself and floated over to the restraints locker, punching in his code. The locker dispensed an anklet, and he tossed it across the space. Naomi caught it with her fingertips and drew it gently through. She fixed it around her left ankle and fed the two ends together. The anklet hissed, and the diagnostic light went green. Havelock checked his hand terminal. The anklet read as ready. No anomalies, no errors. He opened the cell, and Naomi floated out, stretching. Her paper jumpsuit crackled with every motion.

“Shall we?” Havelock asked.

“I’ve been looking forward to it all day,” Naomi said.

The gymnasium was fuller than usual. The uncertainty—the fear—drove some people toward exercise. Havelock didn’t know if it was the sense of action that brought them or the need for exhaustion, the drive to wear themselves down so far that even the fact that they were flying dead over an empty planet and the nearest help was over a year away. Or maybe it was just a way to self-medicate. Endorphins could be wonderful things. He escorted Naomi to a resistance gel box, then took the weight trainer next to her.

The crew at the other machines pretended not to watch them. Most of their expressions were the careful blank of poker faces, but a few were angry. Of the angry people most were focused on her, but a few—Belters mostly—shot accusing glances at him. Havelock pretended to ignore them as he worked the major muscle groups in his back and legs. Any fast movements, and he’d have his weapon drawn, though. Keeping her alive

and himself whole was the job. That and trying to hold everyone together until the ship burned up.

Sweat adhered to his skin, tiny dots spreading, touching, pooling. If he worked long enough, he could wind up in a cocoon of his own sweat. He stopped between sets to wick his face dry, and then also Naomi's. She nodded her thanks, but didn't speak.

When they were done, he opened the gel box and let her out. One of the environmental techs—a Belter with pale hair and a pug nose named Orson Kalk—floated over to claim it next.

"Tu carry caba a oksel, schwist," he said, and Naomi laughed.

"Shikata ga fucking nai, sa sa?" she said.

"Come on," Havelock said. "Let's get moving."

The Belter technician put himself in the gel, and Naomi launched across the room back toward the hall that led to his office and her cell. Havelock looked over his shoulder the whole way back. He didn't feel comfortable until she was back in her cell with the grate closed and locked. He pulled a fresh uniform and some wipes from the locker and fed them through to her before he turned on the privacy shield. He pulled himself back to his crash couch, listening to the soft sounds as she stripped off her old uniform, bathed, and put on the fresh. She was right. The privacy shields on the cells didn't stop sound for shit. He checked his queue. Fifty-seven more requests for comment, and none of them anyone he wanted to speak with. He sent them the canned answer again.

He closed his eyes, trying to judge by how comfortable it was to keep them closed whether he'd be able to sleep. He thought so now, but ever since the reactors had shut down, it was easier to fantasize about resting than to rest.

His monitor chirped. Murtry was on the line. He accepted the connection.

The man on the screen was the one Havelock knew, and he wasn't. Murtry's face had never had much padding to it, but he looked gaunt now. The steely focus Havelock was used to seeing wasn't there, and it took a few seconds to realize it was because Murtry wasn't making the effort to see him.

"You there, Havelock?"

"Yes, sir. How's it going down there, sir?"

“It could be better,” Murtry said. “I need a status update on the drop.”

“Oh. It’s progressing well. We should have it packed and ready for drop in... ah. Looks like six hours and change.”

“All right.”

“Are you not getting the security group alerts, sir? Should I run diagnostics on them?”

“I’m getting them, but I can’t read ’em,” Murtry said. His tone was as calm and conversational as if he hadn’t just admitted he was losing his sight. “So once this drop is done, I want a new priority for the next drop.”

“Of course.”

“We need to construct a semi-permanent shelter down here. Simple enough design that we can put it together even if we can’t see what we’re doing all that well. Sturdy enough to last... well, shit, two to four years, I suppose. See what you can find in the specs. If there’s nothing on board that fits the bill, you can query the databases back home, but I’d rather not miss too many drop windows. I’m not sure how much longer the people down here are going to be up for working.”

“What dimensions do you need?”

“Doesn’t matter. Whatever’s fast and sturdy.”

Havelock frowned. The sounds from the prisoner’s cell were gone. He didn’t know if she was listening. Probably she was. He couldn’t see how it mattered. “Is there anything functional I should be looking for?”

Murtry shook his head. His gaze caught the camera for a moment, then let it go. “If this expedition doesn’t leave survivors, I want to make damned sure that when the next wave shows up, there’s something with a roof on it waiting for them, and that it has RCE printed on it.”

“Planting a flag, sir?”

“I think of it as a minimum fallback position,” Murtry said. “Can you do it?”

“I can.”

“Good man. I’ll be in touch.”

“Is there anything else you need down there?”

“Nah,” Murtry said. “Plenty of things I’d want, but get me that shelter fast enough we can put it up, and we’ll have what we need.”

The connection went dead. Havelock whistled low between his teeth. The privacy shield on Naomi’s cell dropped.

“Hey,” he said.

“Your boss’s plan is to build a shed strong enough to be a headstone when the next group of idiots comes out here to die. I can’t decide if that man’s a nihilist or the second most idealistic man I’ve ever met.”

“Might be room for both.”

“Might be,” Naomi said. And then a moment later, “Are you all right?”

“Me? I’m fine.”

“Are you sure? Because you’re in a ship in decaying orbit, and the man you look up to like a father just told you he was getting ready to die.”

“I don’t look up to him like a father,” Havelock said.

“All right.”

“He has a plan. I’m sure he has a plan.”

“His plan is that we all die,” Naomi said.

In null g, tears didn’t fall so much as build up, sheeting over his eyes until everything looked like it was underwater. Drowned. He wiped them away with his sleeve, but there was still too much moisture running across his lenses, tiny waves that shook the walls. It took almost a minute to bring his breath back under control.

“Well, that must have been amusing for you,” he said bitterly.

“No,” she said. “But if you’ve got a spare tissue, I’d take it. This uniform doesn’t absorb for crap.”

When he looked over, she also had a sheen of tears filling her eye sockets. Havelock hesitated, then unstrapped himself, grabbed the tiny, hard puck of a hand towel, and slid over to her. He passed the puck through the grating, and she pressed it to her eyes, letting the water from them darken the cloth and letting it expand and unfold on its own.

“I’m scared as hell,” Havelock said.

“Me too.”

“I don’t want to die.”

“I don’t either.”

“Murtry doesn’t care.”

“No,” Naomi said. “He doesn’t.”

Words rose in his throat, clogging it. For a moment, he thought he might start weeping again. He was too tired. He’d been working too long under too much stress. He was getting emotionally labile. Maudlin. The knot in his throat didn’t fade.

“I think,” he said, struggling with each syllable, “that I took the wrong contract.”

“Know better next time,” she said.

“Next time.”

She put her fingers through the grate and he pinched her fingertip gently between his thumb and forefinger. For a long moment, they floated there together: prisoner and guard, Belter and Earther, corporate employee and government saboteur. None of it seemed to matter as much as it used to.

Chapter Thirty-Seven: Elvi

The data and analysis came back in a disorganized lump, some from the expert systems on the *Israel*, some from the RCE workgroups back on Luna, Earth, and Ganymede. There was no synthesis, no easily digested summary of the findings. Instead it was opinion and speculation, suggested tests—only some of which were remotely possible with the equipment she had—and data analysis. Between Lucia's medical reports of the early cases among the squatters and Elvi's observations from after the deluge, there was just enough information to fuel a thousand theories and not enough to draw any real conclusions. And Elvi was the head of the local workgroup, and the only person in the universe with access to test subjects and new information.

The death-slugs were relatively simple. The toxic compound was a complex carbon ring with a nitrogenous sheet coming off it that looked superficially related to tetrodotoxin, and appeared to be part of the slug's motility system rather than an anti-predation adaptation. How exactly it crossed into the blood was still mysterious, but the slime had a half dozen r-chiral elements that no one had yet bothered to examine extensively. Whatever new knowledge arose from later study, for Elvi's purposes the answers were all there: neurotoxin, no antidote, try not to touch them. Done.

The eye flora, on the other hand, was more complex. The labs on Luna and Ganymede were working with algal models, treating the growth as if it were an invasive species that had entered a naïve tide pool. The Earth workgroup was arguing that the better model was actually a photosensitive mineral structure. Working from what little medical data had survived the

storm, the *Israel's* expert system suggested that the blindness was less from the foreign mass in the vitreous humor and more from the way that the living organism scattered light. That was very good news because it suggested that killing the organism and breaking down the optically active structures would lead to a fairly rapid return of function. There would be floaters in all their eyes, but most people had those, and the brain was decent at compensating for them.

How to go about killing them, though, was obscure. And time was at a premium. There was a decided spike in white blood cells, so their bodies were trying to clean the invaders out. It just wasn't working.

For her, the symptoms had started with just a little scratchiness around her eyelids no worse than seasonal allergies back at home. Then there was a little whitish discharge and mild headache. And then, seven hours after she first noticed it, the world began to blur a little and take on a greenish hue. That was when she knew for certain that she was going to be blinded by it too.

Fear and practicality were changing the shape of the refugee camp even within the physical constraints of the ruins. People who had gone to the farther parts of the structure were pulling back in now. The need for space and privacy were giving way to the fear of the slugs and the weather and the dread of their growing impairment. The increased density mostly showed itself to Elvi as a change in the ambient sound. Louder voices in conversation that ran together until she felt like she was doing research in the back of a train station. Sometimes it was comforting to have all those human sounds around her, sometimes it was annoying. For the most part, she ignored it.

"Are you doing all right, Doctor?"

Elvi turned from the chemistry deck. Carol Chiwewe stood in the arch that passed for a doorway. She looked tired. And blurry. And vaguely green. Elvi rubbed her eyes to clear them, even though she knew intellectually it wouldn't make any difference. Rain pattered softly against the plastic sheeting. Elvi almost didn't notice it anymore.

"Fine," she said. "You have the new count?"

"We caught forty-one of the little fuckers today," Carol said. "That's an uptick, isn't it? I thought if things dried out a little, they'd start going away."

“Is it drying out?”

“No. It’s raining less, though. I hoped.”

“Too early to call it significant,” Elvi said, entering the data in its field. Tracking the number of death-slugs was just one more of a dozen studies she was juggling now. “The overall trend is still down, and there may be a cycle within the next few days.”

“It would be good if they slept at night. Probably too much to hope for, though.”

“Probably,” Elvi said. “They’re normally subterranean. They’re not likely to be diurnal.”

“We’re running out of food,” Carol said. Her voice didn’t change its inflections.

“The drops are helping,” Elvi said.

“The drops won’t last forever. There has to be something on this planet we can eat.”

“There isn’t,” Elvi said.

Carol said something obscene under her breath, and it sounded like despair. She sighed. “All right. See you again next hour.”

“Thank you.”

Behind her, Fayez yawned and stretched. She’d meant to nap with him, but she hadn’t quite gotten away from the deck. She squinted, checking the time. Fayez had been asleep for three hours.

“Did I miss anything?” he asked.

“Science,” she said. “You missed science.”

“Well, damn. Can I borrow your notes?”

“Nope, you’ll just have to hire a tutor.”

He chuckled. “Did you remember to eat?”

“No.”

“At last. A way I can be useful. Stay here, and I’ll come back with a bar of undifferentiated foodlike product and some filtered water.”

We’re running out of food.

“Thank you,” she said. “And while you’re out there, see if you can find Yma and Lucia. They were going to be doing ocular assessments of everyone.”

“The blind studying the blind,” Fayez said. “It’s like graduate school all over again. I’ll track them down. You should take a break. Rest your eyes.”

“I will,” Elvi lied. Her eyes—all their eyes—would soon be getting plenty of rest. Growing up, Elvi’s aunt had been blind and still perfectly functional, but she’d been living in a farming arcology in Trento. Elvi was on a planet with no sustainable agriculture, an inedible ecosystem, and where touching the wrong thing would kill her on the spot. Context was everything. Her hand terminal chimed. A new batch of reports and letters from the Ganymede group. She opened them with a sigh. If she took time to read all the suggestions they were coming up with, she wouldn’t have time for anything else. She picked one at random and opened it. She had to increase the font to read it, but switching to bright red lettering on a black background helped a little. If the invading organism followed the same growth curve as yeast...

“Success!” Fayez said. “I have returned with sustenance and Lucia. And you aren’t even pretending to have taken a break.”

“Nope,” Elvi said, taking the hard, palm-sized cake of emergency rations from him and turning to the doctor. “What have we found?”

“Good news and bad. Almost a hundred percent infection rate,” Lucia said, sinking to the floor beside her. “The progression is slower in children than adults, it seems, but only slightly.”

“What about RCE versus First Landers?”

“I haven’t seen all the data Yma collected. She was working with your people mostly. My impression is that there’s no difference. Also in the bad news column, it appears to be much more aggressive than the earlier, isolated cases.”

Elvi took a bite of the bar. It tasted like unsweetened fruitcake and smelled like potting soil and it sucked up all the saliva in her mouth like a sponge.

“Higher initial load?” Elvi said around the puck of food in her mouth. “It was so arid before, there might not have been as many infectious particles.”

“Few enough that our immune systems could identify them as foreign and kick them out,” Lucia said.

“Can they do that?” Fayez asked. “I thought these things were a completely different biology. Do our immune systems even work on them?”

“Not as efficiently,” Lucia said. She sounded tired. “But if the storm was loaded with them, they’d swamp what defenses we do have.”

“And then,” Elvi said, “everyone gets it.”

“Yes,” Lucia said. “Only no.”

Elvi opened her eyes again. Lucia was smiling. “Good and bad, remember? We have one man with no growth.”

“None?”

“Even if it were only massively delayed growth, I know what the early signs should look like. Nothing.”

“Could he... could he not have been exposed?”

“He was exposed.”

Elvi felt a bubble of pure joy open in her chest. It was like getting an unexpected present. A flash of lightning brightened the room for a moment, and she wondered why it was green until she remembered.

“So we’ve got the one-eyed man who’s going to be king?” Fayez said. “I mean, better one than none, but I’m not seeing the long-term solve here.”

“We’ve found treatments and vaccines for any number of diseases by studying people who were naturally immune,” Elvi said. “This is a toehold.”

“Right,” Fayez said, rubbing his eyes. “I’m sorry. I may not be at my best right now. I’ve been under a little stress lately.”

Elvi smiled at the little joke. “Will he consent to testing?” she asked.

“Do we care?” Fayez said.

“I haven’t had the chance to ask yet,” Lucia said. “It was hard enough getting the initial screening done.”

“Why?” Elvi asked. “Who is it?”

Holden was at the entrance to the main room. Whatever hues his clothes had been, they were the color of mud now, same as for everyone else; mud, exhaustion, tears, and fear were the new uniform for the RCE and the citizens of First Landing alike. His hair was slicked back and greasy. The beginnings of a spotty, moth-eaten beard mottled his cheeks and the top of his neck. Her failing vision softened away the lines of age and stress and left him a pleasant-enough-looking but unremarkable man. She remembered all the times she’d generated excuses to spend time in his company. It hardly seemed plausible that it was the same person.

She steeled herself and crossed the room.

“Captain Holden? Can I have a moment?”

“I’m really busy right now. Is this something that can wait?”

“It isn’t,” she said.

Holden grimaced, the expression there and gone again almost too quickly to register. “All right. How can I help you?”

Elvi licked her lips, thinking about how to present the explanation. She didn’t have any idea how much background he had in biology, so she figured it was better to start low.

“Captain, you are a very special, very important person—”

“Wait.”

“No, no, I—”

“Really. Wait. Look, Doctor Okoye. Elvi. I’ve been feeling a kind of tension between us for a while now, and I’ve just been pretending not to. Ignoring it. And that was probably a bad call on my part. I was just trying to make it all go away so we wouldn’t have to say anything, but I’m in a very committed, very serious relationship, and while some of my parents weren’t monogamists, this relationship is. Before we go any farther, I need to be clear with you that nothing like that can happen between us. It’s not you. You’re a beautiful, intelligent woman and—”

“The organism that’s blinding us,” she said. “You’re immune to it. I need to get blood samples. Maybe tissue.”

“I’ll help any way I can, but you have understand that—”

“That’s why you’re special. You’re immune. That’s what I was talking about.”

Holden stopped, his mouth half open, his hands out before him, patting the air reassuringly. For three interminable heartbeats, he was silent. And then, “Oh. *Oh*. I thought you were—”

“The eye assessment that Doctor Merton did—”

“Because I thought... Well, I’m sorry. I misunderstood—”

“There was. The tension? You were talking about? There was some tension. But there’s not anymore,” Elvi said. “At all.”

“Okay,” Holden said. He looked at her for a moment, his head turned a degree to the side. “Well, this is awkward.”

“It is *now*.”

“How about we never mention this again?”

“I think that would be fine,” Elvi said. “We will need you to come let us take some blood samples.”

“Of course. Yes. I’ll do that.”

“And as my vision starts failing, I may need you to come read some of the results to me.”

“I will do that too.”

“Thank you.”

“And thank you, Doctor Okoye.”

They each nodded to the other two or three times, apparently unable to break free of the moment. In the end, she spun on her heel and headed back, navigating between the knots and clusters of people camped on the floor of the ruins. One of the squatters was weeping and shaking back and forth. Elvi stepped past him and trotted back to the lab. Yma had arrived in her absence, sitting cross-legged on the floor with Lucia as they compared data. Elvi didn’t think her eyes were getting markedly worse until she tried to look over their shoulders. Yma’s hand terminal was a blur of white and blue, as empty of usable information as the clouds.

“Did he agree?” Yma asked, her voice tense as stretched wire.

“He did,” Elvi said, sitting down at the chemistry deck. The water bag needed to be refilled. A time was going to come—and soon—when the little deck was going to have to stop generating drinking water so that she could use its full resources to run her tests. It wasn’t yet. She swapped out the water bags.

“Did you get a history?” Lucia asked.

“A medical history? No. I was thinking perhaps you could do that.”

“If you’d like,” Lucia said, levering herself up from the ground. “He’s back in the main room?”

“He is,” Elvi said, kneeling at the deck controls. A smear of mud darkened the readout, but when she wiped it away, she could still make out the letters. “I’ll set up a few screenings for his blood.”

“Lachrymal fluid too?”

“Probably a good idea,” Elvi said. “Just see if there’s anything out of the ordinary.”

“All right then,” Lucia said. When she walked toward the door, her steps had a little hitch in them. A hesitation. Elvi wondered how much longer the doctor would be able to function. The same question for all of them. There

wasn't time.

"Anything new in your data?" she asked.

"Consistent," Yma said. "Whatever it is, it doesn't draw a distinction between us and the squatters."

"Well, it's the only one."

The hours passed without Elvi being aware of it. Her mind and attention had taken her outside the world of minutes and hours to a place defined by test runs, transmission lag, and slowed only by her failing sight. Even before Holden's test results came back, she was prying what information she could from the samples of the organism, categorizing it only to find analogies with other plants or animals or fungi. The sense of time running short was a constant, and so, like a noxious smell over an extended period, before long it stopped being something she noticed. And instead, she felt the simple joy of doing what she did best. They had chosen her for the assignment because biological systems made sense to her, working through knotty problems was what she did for fun. For months now, she had been doing a long run of data collection. It had been lovely to see this new world, to watch its first secrets unfold, but it had also been easy. A graduate assistant could have gathered all the same samples she had.

This work was hard, and it was her. And while the life or death of everyone on New Terra resting on it scared her, it didn't take away the essential joy of her work.

"You need to eat," Fayez said.

"I just did," she said. "You gave me that bar."

"That was ten hours ago," he said gently. "You need to eat."

Elvi sighed and leaned back from the screen. She'd been bent almost double trying to make out the results. Her back ached and there was a headache building all across the front of her skull. Fayez held something out. Another bar of emergency cake. When she took it, his fingers stayed with hers.

"Are you all right?"

"I'm fine," Elvi said.

"You're sure?"

“Well, apart from the obvious. Why?”

“You seemed a little distant.”

“I’ve been working.”

“Sure. Of course. I’m sorry. I’m just being stupid.”

“I don’t understand,” Elvi said. “Haven’t I been acting the same way I always do?”

“Yes, you have,” Fayez said, letting go of her hand. “That was kind of my point. After... after, you know—”

“The sex?”

He shifted. She imagined him closing his eyes. Wincing a little bit. With her eyes as bad as they were, it wasn’t much more than a guess, but it filled her with a surprising glee. Who would have guessed? Fayez with tender feelings.

“The sex,” he said. “I just wanted to make sure that we were okay. That things were all right between us.”

“Well,” she said, “orgasm does release a lot of oxytocin, so I’m probably more fond of you than before.”

“Now you’re teasing me.”

“That too,” she said, and took another bite of the cake. It really was awful stuff.

“I wanted to make sure that I knew where we stood.”

“I haven’t really thought about it,” Elvi said, gesturing at the chemistry deck. “You know. Busy.”

“Of course,” Fayez said. “I understand.”

“Once we’re not all going to die, though, maybe we could talk about it? Would that be okay?”

“That would be fine.”

“All right, then. It’s a date,” Elvi said, and sat back down at the deck. Her back hurt. Especially between the shoulder blades. She went through the tools screen, trying to find a way to bump the font up another level, but the deck’s options were very limited. She was going to need help, and soon. In the main room, someone called out sharply, and a dozen voices rose in an answering chorus of complaint.

“Okay, that wouldn’t be fine,” Fayez said. “Elvi, listen. You are the smartest woman I’ve ever met, and I’ve been at some of the best universities there are. If there’s anyone, anywhere that can get us out of this,

it's you, and I would very much like to grow very, very old and decrepit and probably incontinent and senile in your company. So if you could save my life and everyone else's, I'd very much appreciate it."

That's sweet and Please don't put more pressure on me right now and I'll try warred in her mind. Somewhere at the edge of the ruins, someone shouted. She hoped it wasn't a slug, that it wasn't another death. That it wasn't something else that had gone wrong.

"Okay," she said.

Chapter Thirty-Eight: Holden

Holden shuffled his way around the tower again.

The sky was the iron gray of an overcast noon. The rain had tapered off to a faint drizzle just heavy enough to keep his hair and clothes soaked and send rivulets of water down his spine. The wet ground sucked at his boot heels with each step. The air smelled of ozone and mud.

A small group of death-slugs were nosing at a crack in the tower's base. A wad of fabric blocked their entrance, but they were using their narrow noses to probe at it, looking for a way in. Holden hefted his long-handled shovel recovered from the ruined mines and smashed them flat with one heavy blow. He scooped up the gooey corpses and threw them away from the tower, then let the light rain wash the slime off the blade.

He moved on, finding only the occasional straggler on the tower wall. These he scraped off and flung away using the shovel like a catapult. At first, it had been sort of fun to see how far he could throw them. Now his shoulders and arms burned with fatigue and his distances were getting shorter and shorter.

Miller followed along sometimes, not saying anything, just a gray basset-hound-faced reminder that Holden had more important things to be doing.

He vanished when Holden rounded a corner and found a small work crew resting near a partially dug trench. They were trying to get at least a shallow water-filled ditch all the way around the tower, but it was slow work with their primitive implements.

This particular group was made up of three women and two men with crude digging tools. They were stretching and drinking water from one of

the bags the purifier put out. One of the women gave him a nod, the other four ignored him.

One of the two men had a slug on his pants.

It hung on the fabric, just above his right knee. There was no slime trail around it. None of the five diggers seemed to notice it was there. Holden knew that if he shouted in alarm, the man might take a swipe at it with his hand without thinking. So he calmly walked toward him and said, "Don't move."

The man frowned back at him. "Que?"

Holden grabbed the man by the shoulders and shoved him onto his back. "The fuck?" the other man said. They were all backing away from him like onlookers at the start of a fight. Holden leaned over the man on the ground and repeated, "Don't move." Then he grabbed the cuffs of the man's pants and yanked them off with one hard pull. He threw them as far away as he could.

"What just happened?" said the woman who'd first nodded at him. Holden recognized her now. Older, tough, one of the bosses at the mine. Probably in charge of the trench crew.

"Didn't anyone see that he had a slug on his knee?"

"Babosa malo?" someone muttered.

Holden reached down a hand and pulled the dazed man to his feet. "You had a death-slug on your pants. Were you leaning against this wall?"

"No. I don't know. Maybe, for a second," the man started.

"I told you people," Holden said, first to the man then rotating to face the crew boss. "I told you not to touch the walls. The slugs climb them to get away from the water."

The crew boss nodded at him with one fist. "Sa sa."

"You didn't see it," Holden said, not asking a question. "How bad? Malo que sus ojos?"

"Ojos?" the man asked.

"Not ojos. Ah. Orbas. Eyes."

"Na khorochó," the man agreed with a Belter shrug of his hands. Not good.

"Well, the price you pay for not letting your boss know you couldn't see well enough to avoid slugs is now you have no pants."

"Sa sa."

“So go back inside,” Holden said, giving the man a gentle shove toward the tower entrance, “and see if you can find some way to cover your shame.”

“Sorry, boss,” the man replied, then trotted off.

“Anyone else on the crew that bad?” Holden asked the team leader. She frowned and shrugged.

“Not great. We all missed it.”

“All right,” Holden said, rubbing his head. It sent the water clinging to his scalp and hair running down his neck. After a moment he said, “Take them all back.”

“The trench.”

“Too risky now. I’ll stay on patrol. Get your people inside.”

“All right,” the woman said, then started leading her people toward the entrance.

Holden’s hand terminal buzzed at him, and when he pulled it out he saw someone had been trying to connect for a while. He allowed the connection and after a few seconds Elvi appeared on the screen.

“Jim, where are you? I need you back at the lab.”

“Sorry,” Holden replied. “Kinda busy out here.”

“Your bloodwork just finished. I need you to come read me the results.”

The screen on the analysis rig was tiny. Who, in the age of implantable vision correctives, had bad eyesight? Holden felt he could make a usability argument to the designers now.

“Let me finish this patrol,” Holden said.

“This is important.”

“So is keeping alive the idiots who insist on working outside when they can’t see.”

“Hurry then. Please,” she said and killed the connection.

Holden was putting his terminal away when it started pinging at him. A quick glance at the screen showed it was alerting him to another supply drop. He held the terminal up to the skyline and let it direct him to the location of the drop. A distant white parachute popped into view as the terminal zoomed in on it. Too far. They were still coming in randomly scattered over too wide an area. They had teams out recovering the first several drops, but pretty soon they wouldn’t have anyone left who could see far enough to make a dangerous trek out to the supplies and back.

Anyone but him.

He headed off to find Amos and their potential solution to that problem. The mechanic had set up his little workshop a few hundred meters away from the tower under an A-frame shelter made of corrugated plastic sheeting. A variety of tools, salvaged electric cart parts, and welding supplies littered the cramped space beneath.

“How’s it looking?” Holden asked, then walked into the shelter and sat on a plastic crate filled with odds and ends.

Amos sat cross-legged on a sheet of plastic surrounded by battery housings in various states of disassembly. “Well, here’s the problem,” he said, waving at the batteries with one thick arm.

“As in?”

“As in, I got a couple carts they hauled out of the soup around the mines that I can have ready to roll in hours if I throw my back into it. Turns out they don’t mind being submerged all that much. The drive assemblies need the mud cleaned out and shit, that’s an easy job.”

“But the batteries are hosed.”

“Yeah, that’s about the size of it.” Amos picked up a delicate-looking strip of metal covered in rust spots. “They minded.”

Holden took the corroded lead out of Amos’ hand and looked it over for a few seconds, then tossed it on a growing pile of bad parts. “The ships say high-altitude winds are making precise drops impossible,” he said. “Right now, I can send out search teams to track them down.”

“Right up until your searchers can’t see to piss without hitting their shoes.”

“Right up until then. And then I’m the only person who can go get the supplies. And I can’t keep up with that and everything else without some wheels.”

“Okay,” Amos said. “Good news is I think I can assemble two or three working batteries off the parts. Bad news is I’ll probably only be able to charge one.”

“One is all I need. And a functioning cart to put it in.”

“I can make that happen,” Amos said. He slowly reached across his body and grabbed the oxyacetylene torch. It popped to life with a bright blue flame that he pointed at something on the ground. A death-slug that had been creeping up on him died with a hiss and a sizzle.

“How are your eyes doing?” Holden asked, keeping his tone casual.

“Okay so far,” the mechanic replied. “We haven’t been here as long, maybe. But I can see green flaring at the edges of my vision, so I know I got the bug same as everyone else.”

“You should be inside with the rest of us.”

“Naw,” Amos said. As he spoke, he grabbed one of the partial batteries and began pulling it apart. “Lot of this salvage Wei’s people are bringing in is leaking toxic shit you wouldn’t want in the air in there. Plus, I don’t want those people getting touchy-feely with my stuff.”

“You know what I mean. This shelter you’ve set up makes an attractive dry spot. The slugs will be swarming you by nightfall.”

“Maybe,” Amos agreed with a nod. “But I got my plastic sheet to keep ’em from popping up out of the ground. And the ones that try to crawl in get fried by the torch. I leave their little smoking corpses out there. The live ones seem to avoid ’em. I think I’m okay.”

Holden nodded, and sat with Amos in companionable silence for a few minutes while the mechanic finished stripping the battery and laying out the parts based on how damaged they were. He was building a pile of clean parts to assemble new battery housings out of. Holden knew if he offered to help he’d just get in the way, but it was so nice to be both out of the rain, and out of sight of the anxious colonists, that he didn’t want to leave.

“You know,” he finally said, “if your eyes get much worse I’m going to have to make you come inside. Finished with this or not.”

“I guess you can try,” Amos said with a laugh.

“Don’t fight me on this,” Holden said. “Please. Can I have one thing no one is fighting me on? I’m not leaving you out here to get poisoned. And if you’re blind, I think I can take you.”

“Might be fun to find out,” Amos laughed again. “If it’s anybody, it’s you, I guess. But I’m not being obstinate to be a pain in your ass, Cap. I hope you know that.”

“Then what?”

“Everybody in there has the same fucking problem. Running out of food, going blind, planet blew up,” Amos said. He began assembling a battery out of spare parts while he spoke. His deft fingers knew the work so well he almost didn’t have to look at it. “Know what they’ll be talking about?”

“That?”

“Yeah. ‘Boo hoo, I ain’t got no food, I’m going blind, holy shit there’s poison slugs.’ I don’t do group therapy. Couple minutes of bitching and moaning, I’m gonna start knocking people out just to get some peace.”

Holden slumped on the crate, putting his soggy head in his hands. “I know. I get to listen to that instead. It’s making me a little cranky.”

“You’re cranky because you’re tired,” Amos said. “You got that I-have-to-save-everyone hangup, so I make it that you haven’t slept in about two days. But listening to people bitch? Yeah, that’s sorta your job. It’s why you make the big money.”

“We make the same money.”

“Then I guess you’re doing it for the fame and glory.”

“I hate you,” Holden said.

“I’ll have that first cart up and running by the end of the day,” Amos replied, snapping the battery housing together with a plastic click.

“Thanks,” Holden said, then pushed himself to his feet with a grunt and started slogging his way back toward the tower.

“Anytime,” Amos said to his back.

Holden’s terminal started buzzing again. “Jim, where are you?” Elvi said the moment he accepted the connection. “I need this data—”

“On my way,” he replied. “Sort of wearing a lot of hats right now. But I should be there in a minute.”

He killed the connection just in time to for Murtry to come out of the tower’s main entrance and make him a liar.

“Captain,” Murtry said.

“Mister Murtry. How are things on your end? Amos seems to be making good use of the salvaged carts.”

“He’s a good mechanic,” the RCE security chief replied. “There was another drop.”

“Saw it. My terminal marked and mapped it. Let me transfer the location so you can send a team.”

As he transferred the data, Murtry said, “We lost a man.”

“Who?”

“Paulson. One of my drivers. Slug crawled into his boot when no one was looking.”

“I’m very sorry,” Holden said, trying to remember if he knew which one

Paulson was, and feeling guilty that someone had died to help them out and he couldn't even put a face with the name.

"Stupid mistake," Murtry said. He tapped out some rapid commands on his terminal. "And I wasn't looking for your sympathy. Just apprising you of the situation and our reduced team strength."

"Okay," Holden said, surprised that the man's lack of empathy still surprised him.

"Wei will handle the supply pickup."

"How's her vision doing? How many more of these runs does she have in her, do you think?"

"She's on her way," Murtry said with a humorless smile. "So at least one more, I'd say."

"Great," Holden said. "Tell her I said thanks."

"Will do," Murtry replied, ignoring the irony. "But I need something from you."

"You need, or RCE needs?"

"Consider those the same thing at this point," Murtry said. "Should be some construction materials in this load. I need to assemble a work crew to set up my structure before everyone is too blind to do the job."

"What's it for? There's a ton of other work we need to do while we can. And in a turn of luck," Holden said, pointing at the alien tower behind him, "shelter is not one of our pressing problems."

"These people," Murtry said, "are eating my food, drinking my water, and taking my medicine. My team is gathering the supplies and doing the dangerous salvage work that makes any of this possible. You know what? As long as that remains true, they can throw up a few walls for me when I ask."

"Then what do you need from me?"

"They have the mistaken impression you're in charge. Correcting them seemed impolite."

Holden had a sudden mental image of dragging the soon-to-be-blind Murtry out into the middle of the rain-soaked desert and abandoning him at the center of a swarm of the lethal slugs.

"Did I say something funny?" Murtry asked.

"Inside joke," Holden replied with a smile. "You had to be there. I'll let Carol know you're looking for volunteers."

Before Murtry could object, Holden turned and walked away.

Inside, the tower was a buzzing hive of activity as the colonists hurried to finish their last preparations for the coming long night. Lucia had a group working to fill everything that could hold water with supplies from the chemistry deck. Carol Chiwewe was leading a team through the interior of the tower hunting out any remaining death-slugs and plugging any holes they could find.

Holden climbed a ramp and then a set of steps made out of empty packing crates to reach the third floor of the tower. Inside the chamber they'd optimistically named the lab, he found Elvi, Fayez, and a third member of the RCE science team whom Holden thought was named Sudyam.

"Who is that?" Elvi asked. She poked Fayez in the bicep. "Is that Jim?"

Fayez squinted at him for a second then said, "Finally."

"Sorry I was late, but Murtry wanted—"

"I need you to come read this," Elvi said over the top of him. She was pointing at the chemistry deck's small screen. Holden walked over and looked at the display, but had no idea what any of the confusion of symbols and acronyms meant.

"What am I looking for?"

"First we want to check the CBC," Elvi said, coming over to point at the screen. Nothing on it said CBC.

"Okay," Holden said. "Will it say CBC? I don't see CBC here."

Elvi sighed, then began speaking slowly. "Does the screen say 'results' at the top?"

"No. It says 'tools' at the very top. Is that what you mean?"

"Wrong menu. Hit the back button," Elvi said, pointing at a button on the screen. Holden pushed it.

"Oh, I see a results option now."

"Hit that. Then we're going to be looking for numbers on the CBC, RBC, WBC, hemoglobin, hematocrit, and platelet count readouts."

"Hey," Holden said happily, "I see all that stuff."

"Tell us what they are."

Holden did so, while Elvi made notes on her terminal. She had the display blown up to the point where Holden could read it from across the room.

“Back up now and let’s look at blood gases,” she said when they were done. It took over an hour, but in the end Holden had given them all the results they were looking for. They decided to take some more of his blood and let him go.

When they were done, he stood next to Elvi pressing a scrap of bandage against the puncture wound. “Are we any closer?”

“It’s not an easy process,” she replied. “Even with access to all these minds and the *Israel*’s computer. We’re looking for a needle in a complex organism.”

“How much time do we have left?”

Elvi tilted her head up so the light shone into her pupils. Holden could see the faint green tinge there. “Almost none,” she said. “But you should go get some sleep. You’re exhausted.”

“My blood told you that?”

“You haven’t slept in two days,” she said with a laugh. “Math tells me that.”

“I promise, I’ll hit the rack as soon as I can,” he lied to her.

He climbed down the makeshift steps and the weirdly alien curve of the ramp to the tangle of people at the ground floor. Lucia had turned over water duty to her assistants, and was shining a penlight into the eyes of a small child. She gave Holden a tired smile as he walked by. Someone gave an alarmed shout, then rushed through the room carrying a slug on a stick and threw it outside. Holden followed it outside and stomped on it.

The sky was darkening to the color of damp ash, and the rain was becoming heavier. Distant thunder rumbled to the east, the lightning visible only as dim flashes in the heavy clouds. The air smelled of ozone and mud.

Holden shuffled his way around the tower again.

Chapter Thirty-Nine: Basia

Hey Papa!” the Jacek on the screen said. The boy’s voice almost vibrated with fear and exhaustion.

Hey son,” the recorded Basia and the real one said at the same time. Jacek began talking about death-slugs and lightning and living in the alien ruins, reciting words of reassurance and explanation that Basia could recognize as Lucia’s. Jacek soberly repeated all the reasons his mother had given him that things might end well, telling Basia as an excuse to hear them again himself. It was the third time Basia had watched the recorded video of his conversation with his boy. When it finished, he cued up the recording of his conversation with Lucia and watched it for the tenth time.

He considered asking Alex to call them again, get new conversations to record, but he recognized this as a selfish impulse and quashed it.

Jacek looked dirty, covered with mud, tired. He described the horror of the poisonous slug worms with dread and fascination. The constant lightning storms and rain were amazingly exotic to a child who’d only ever lived in ice tunnels and ship holds before coming to Ilus. He never said he wished his daddy was there, but the fact sang in his words. Basia wanted nothing more than to take his boy by the hand, tell him it was all right to be scared. That bravery was being scared and doing it anyway.

Lucia, when her turn had come, looked less fearful than exhausted. Her smiles for him were all perfunctory. Her report was vague because, he knew, she had nothing to say that would help either of them to hear.

Felcia’s videos had been the ones that brought him peace. She was the one member of his family he had felt like he hadn’t failed. She’d wanted to go to school, and he’d managed to push down his fears and needs and the

burdens that he carried long enough to actually let her go. It had felt like a victory.

Until now.

Now he only saw the ticking clock Alex had left running, showing the remaining time until she burned up across Ilus' sky.

The simulation and timer ran out their terrible program on the panel behind him. He tried never to look. When he needed to use the screens on the operations deck, he drifted through the compartment trying not to even glance in its direction. He tried very hard to forget that it existed at all.

He failed.

Watching his most recent conversation with Felcia for the fourth time, he felt the timer behind him, like a warm spot on his back. Like the stare of someone from across a crowded room. The game became how long he could go without looking. Or whether he could distract himself sufficiently to forget it was there.

On the screen, Felcia told him about learning to change air scrubbers on the Belter freighter. It wasn't the sort of things she'd had to do in the long months when the *Barbapiccola* had been their home. Her graceful fingers were demonstrating some complex function necessary to the process. She made it seem light. Fun. Amusing. He was her father. He knew that she was scared.

Tick tick tick, the clock burned soundlessly at his back.

He adjusted the air recycling system nozzle near his panel and sent a cool breeze across his face. He finished the recording and spent some time organizing his files by content and date. Then decided it was better by date and name, and reorganized them again.

Tick tick tick, hot like the sun on a dark shirt at noon. Burning without burning.

He opened up the file Alex had set up with repair tasks and scrolled through the list. He'd already checked off the ones he was actually capable of doing. He spent some time looking over the rest of the items, trying to decide if there were any he could help out with. Nothing jumped out at him. Not surprising, since it was his fifth time through the list.

Tick tick tick.

Basia turned around. The first thing he noticed was that the simulated orbital paths looked different. The changes were so slight that he probably

shouldn't have been able to see them, but the bright hateful lines that described his only daughter's demise had burned themselves into his brain. There was no doubt, they were different. For some reason, it took him longer to notice that the clock had changed.

There were three fewer days.

Last time he'd looked at the clock, just a few hours before, there had been slightly over eight days on it. Now there were just under five.

"The clock is broken," he said to no one.

Alex was up in the cockpit, where he seemed to spend most of his time. Basia yanked at the straps holding him to the chair, fighting with them without success until he forced himself to calm down and just press the release latches. Then he kicked off to the crew ladder and climbed up.

Alex had a complex-looking graphic on his main display. He was working at it with gentle touches on the screen and a steady stream of muttering under his breath.

"The timer's wrong," Basia said. If it weren't for the fact that he found himself inexplicably out of breath, he probably would have yelled it.

"Hmmm?" Alex swiped at the panel and it shifted to a graph filled with numbers. He began entering new figures into it.

"The clock—the orbital timer thing is broken!"

"Workin' on it right now," Alex said. "It ain't broke."

"It's down to five days!"

"Yeah," Alex said, then stopped working to rotate his chair and look at Basia. "Was going to talk to you about that."

Basia felt all the strength go out of him. If there had been gravity, he would have slumped to the floor on legs made out of rubber. "It's right?"

"It is," the pilot said, swiping the screen behind him again to get back to the graphical display. "But it ain't unexpected. The initial estimates about their batteries were gonna change. They were back-of-the-napkin kind of shit to start with."

"I don't understand," Basia said. His stomach had clenched tight. If he'd bothered to eat anything in the last day or two, he'd probably have vomited.

"The first estimate was based on orbital distance, ship mass, and expected battery life versus consumption." As Alex spoke, he pointed at various places on his graph. As though that explained anything. As though the graph made any sense. "Orbital decay's just not something anyone

worries about when the reactors are on. If any of us had wanted to, we coulda built orbits that were damn near permanent, but the *Barb's* got that shuttle going up and down with the ore, so she went kind of low. Save a little on each trip. And, forgive me for saying it, she's a flyin' hunk of shit. Heavier than she should be, and batteries dyin' fast. So, the new numbers."

Basia floated next to the gunner's seat watching the hateful math spool out across the screen.

"She lost three days," he finally said when he found the breath to do it. "Three *days*."

"No, she never had those days to start with," Alex replied. His words were harsh, brutal, but his face was sad and kind. "I haven't forgotten my promise. If the *Barb* goes down, your little girl will be on this ship when it happens."

"Thank you," Basia said.

"I'm goin' to call the captain right now. We'll work up a plan. Just give me some time. Can you do that?"

Five days, Basia thought. *I have five days to give you.*

"Yes," he said instead.

"Okay," Alex said and waited expectantly for Basia to leave. When he didn't the pilot shrugged and turned around to call up the comm display. "Cap'n, Alex here. Come in."

"Holden here," the familiar voice said a few seconds later.

"So, ran the updated numbers like you asked. We're definitely losing the *Barb* first."

"How bad?" the captain asked. His connection seemed fuzzy. It took Basia a moment to realize it was the sound of rain.

"Just under five days until she starts scraping on more atmo than she can handle."

"Dammit," Holden said, then nothing. The silence went on long enough that Basia started to worry they'd lost their connection. "How's the *Roci*?"

"Oh, we're fine. Pretty much everything's off but the lights and the air. Lots of slack."

"Can we help?"

"Like," Alex said, dragging the word out, "give 'em a tow?"

"Like that. What can we do?"

"Boss," Alex said, "hooking two ships together like that can be done,

but doing it in low orbit ain't a trivial problem. I'm just a pilot. Sure would be nice if we had, you know, our engineer back to run those numbers."

"Yeah, no kidding," Holden said. He sounded angry to Basia. That was good. Angry was good. Basia found himself oddly comforted by the idea that someone other than him was upset by the situation.

"Any chance on that?" Alex prompted.

"Let me chat with Murtry again," Holden said. "I'll call back soon. Holden out."

Alex sighed. His lips pressed thin.

"Talking's not going to work," Basia said. "Is it?"

"I don't see how," Alex said.

"Which means there's a non-zero chance that we'll wind up needing to go get her ourselves. You know there's only two of us. You and me. That's it."

"There's three of us," Alex said, patting the control panel. "Don't forget. We've got the *Roci*."

Basia nodded, waited for his gut to clench up again, was surprised to find he felt a warm sense of peace flowing through him. "What will I need to do?"

"This is an LVA suit," Alex said, pointing to the equipment secured in an open locker. They were on the airlock deck, which, other than the airlock, consisted almost entirely of lockers and storage closets. The contents of that particular locker looked like a rubber body suit with lots of attachments.

"Elveeaye?"

"El. Vee. Ay. Light vacuum armor. Lets you move around outside, with enough air and shielding to keep you breathin' and mostly unradiated in normal applications." Alex pulled the rubber-looking suit out and left it floating next to the locker for Basia to examine. "Self-sealing in case of puncture, with life support and injury sensors, and basic medical supplies built in." He then pulled out a red, metallic-looking breastplate. "It also keeps you from getting *too* many holes poked in you by small-arms fire."

As Alex pulled out each piece and showed it to Basia, explaining its function, Basia dutifully examined them and made what he hoped were

appropriate noises. He'd worn vacuum suits for work almost his entire adult life. Their form and function were well known to him. But the various pieces of armor and technology that made the suit into a weapon of war were outside his experience. Certainly something Alex described as "automatic IFF and hostile tracking available through the HUD display" sounded impressive and useful, but Basia had no idea for what. So he nodded his head and looked thoughtful and examined the helmet when Alex handed it to him.

"You ever fired a gun?" Alex asked when the armor had all been pulled out of the locker.

"Never," Basia said. He had a brief, vivid memory of the assault on the RCE security team. Of the horrible injuries the gunshots left. Of the surprised looks on their faces as they died. Basia waited for the nausea to start, but still felt only the warmth and calm. "Held one once. Pretty sure I didn't fire it."

"This," Alex said, holding up a thick black pistol, "is a 7.5mm semi-automatic handgun. Twenty-five-round magazine. Standard sidearm of the MCRN. It's fairly idiot-proof, so this'll be the one I send you in with."

"If I go in at all," Basia said.

"Sure," Alex agreed with a smile. "Don't really have a range to practice on here, but you can dry fire it a few times to get the feel. Honestly, though, if you get over there and need to be dead-eye Dick to make it back, you're pretty much fucked."

"Why carry it at all, then?"

"Because people do what you want them to do when you point one of these at them," Alex said.

"Might as well be empty, then," Basia said, taking the gun from him and waving it through the air to feel the weight.

"If you want," Alex replied.

"No. Show me what to do. Then let's load it." *For Felcia. I can do it for her.*

"Okay," Alex said, then proceeded to do just that.

Holden called back several hours later. When he spoke, his voice was tight,

angry. “Holden here. Murtry isn’t going to bend an inch, so fuck him. Go get Naomi back. Out.”

“Well,” Alex said, dragging the word out to a long sigh. “That’s it. I think we’re officially not mediators anymore.”

Basia nodded with his fist, causing his body to rotate slightly. They were floating on the ops deck. The various pieces of the disassembled pistol hung in the air next to Basia. Alex had insisted that he know how to take the gun apart and put it back together again. Basia had no idea why that would be important, but had gone along with it anyway.

“What now?” he asked.

“Better start puttin’ that back together. I’ll pull the *Israel*’s specs up again and we can give them one last look. Remember, stuff gets moved around on a working ship. Things ain’t always where the standard blueprints say they are. You’re gonna want alternate ingress and egress points in case someone sealed off a corridor you wanted to use.”

“I have a good memory,” Basia said. It sounded like a brag, but it was true. He’d grown up in corridors and hallways. His sense of direction was excellent.

“That’ll help. Then we get you suited up, and I drop you off,” Alex said, then paused. “But there is one issue we haven’t discussed. I got plenty of juice to get you over there. And the *Roci* can make sure no one messes with you in space. But I can’t get you inside.”

Basia surprised himself by laughing.

“Somethin’ funny?” Alex said, raising an eyebrow at him.

“Funny that you’re worried about the only part of this where I actually know what I’m doing,” Basia said. “I’m a licensed class 3 vacuum welder. I weld in space. You *find* me a ship I can’t cut my way into. Just try.”

“Alrighty,” Alex said and gave him a light slap on one shoulder. “Let’s get to work.”

Basia drifted away from the *Rocinante*. Instead of a simple vacuum suit and air supply, he wore state-of-the-art Martian-made light combat armor. Instead of walking across the hull of the ship on magnetic boots, he moved across half a dozen kilometers of vacuum on gentle puffs of compressed

nitrogen. Below his feet, Ilus spun, an angry gray world, wrapped in storms and flashing constantly with high-altitude lightning. Lucia and Jacek were down there, under all that atmospheric rage. But he couldn't do anything to help them. So he would help the person he could. He would save Naomi from the RCE ship and she would save his daughter. There were a lot of holes in that logic that he carefully avoided thinking about.

He drifted closer to a massive island of gray metal in the darkness. The *Edward Israel*. The enemy.

"You okay out there?" Alex said over the comm. The helmet's small speakers flattened his voice. There was also an aggressive background hiss to it.

"Fine. Everything is green." Alex had shown him how to page through the status indicators on the suit's heads-up display, and Basia was dutifully checking them every few minutes.

"So, I'm making all sorts of angry demands for the release of Naomi," Alex said. "Got the *Israel* locked up with a targeting laser, and I'm floodin' their sensors with radio noise and light scatter. Should keep their eyes, what eyes they got left, firmly planted on the *Roci*. Give you a minute or two before they realize you're cuttin' your way in."

"That doesn't sound like very long," Basia said.

"Cut fast. Alex out."

Alex had reassured him that the *Rocinante* had plenty of battery power. That shooting lasers and blasting out radio jamming wouldn't affect it much. But Basia had come to view power as a precious and irreplaceable resource. Not something he'd ever needed to do in the age of readily available fusion. It gave everything a sense of permanence it hadn't had before. No do-overs. No we'll-get-it-right-next-time.

He checked his course toward the *Israel*'s midship maintenance airlock, found it good, and pulled out his welding torch, holding it in a white-knuckle grip.

The ship swelled until it blocked his view in every direction. The airlock hatch resolving from a tiny slightly lighter dot to a thumbnail-sized square to an actual door with a small round window in it. The pre-programmed EVA pack fired off a long blast of nitrogen in four cones of vapor, and he drifted to a gentle stop a meter away.

The welding rig came to life with a burst of bright blue fire. "Here I

come,” Basia said to Naomi and to the RCE people guarding her and to his baby girl thousands of kilometers away on her dying ship.

Here I come.

Chapter Forty: Havelock

I've shut down everything I can," Marwick said on the screen. "Sensors, lights, entertainments. I've dialed back the cooling. With the batteries being what they are, I'll give us just under seventeen days. And that's with the solar collectors up at full. Less than that if they start failing. After that, it'll be time to decide whether we'd rather suffocate or burn."

Havelock rubbed his forefinger and thumb deep into his eye sockets. He hadn't gone to the gym, and he was trying to make up for it by increasing the cocktail of null-g steroids. It wasn't a long-term fix, but the more he looked at it, the less it seemed like he'd need one of those. It did give him a headache, though. If it hadn't been for Naomi, he wouldn't have spent as much time exercising as he had. Something to thank her for.

His office felt stuffy and close, and the temperature was climbing steadily. As a boy living planetside, he'd always thought of space as cold, and while that was technically true, mostly it was a vacuum. And so a ship, mostly, was a thermos. The heat from their bodies and systems would bleed off into the void over years or decades if it had the chance. If he could find a way to get them the chance.

"Have we mentioned it to the crew?" he asked.

"I haven't, but the data's hard to keep secret. Especially when it's a can full of scientists and engineers with little enough else to do. We're going to need to talk about dropping them. As many as we can."

"So that they can starve and die on the planet if the moons don't shoot them down?"

"Most part, yes," Marwick said. "They've come a long way not to put foot on the surface. There's more than one I know would prefer dying

there.”

In her cage, Naomi coughed.

“I’ll talk to Murtry,” Havelock said. “Having a graveyard on the planet might be something he’d want. Especially if we could get more bodies in it than the squatters have.”

Marwick sighed. He’d stopped shaving, and when he rubbed his chin it sounded like someone throwing a handful of sand at a window. “We came close, though, didn’t we? All the way out here to start the whole damned world up again.”

“We saw the promised land,” Havelock said. “What about the *Barbapiccola*? What’s her situation?”

“Makes ours look good. That lithium ore’s going to be a high-atmosphere vapor in a little over four days.”

“Well, I guess we won’t need to worry about stopping them from taking it back to the market.”

“Problem’s about to solve itself,” Marwick agreed. “But to the point. Security? These people are facing a death they can’t fight and they can’t flee from. They’re going to get crazy if we don’t do something. And neither you nor I have the manpower to stop them if things get out of control.”

What would it matter? Havelock wanted to say. *Let them riot. It won’t change how long before we hit air. Not even by a minute.*

“I hear you,” he said. “I do have the security override codes. I’ll have the autodoc add a little tranquilizer and mood stabilizer, maybe some euphorics to everyone’s cocktail. I don’t want to do much, though. I need these people thinking straight, not doped to the gills.”

“If that’s how you want to play it.”

“I’m not putting this ship on hospice. Not yet.”

The captain’s shrug was eloquent, and left nothing more to say. Havelock dropped the connection. The screen went to its default. Despair rushed up over him like a rogue wave. They had done everything right, and it didn’t matter. They were all going to die—all the people he’d come to help protect, all the people on his team, his prisoner, himself, everyone. They were going to die and there wasn’t anything he could do about it but get them high before it happened.

He didn’t know he was going to punch the screen until he’d already done it. The panel shifted in its seating a little, but he hadn’t left a mark on

it. The gimbals of his crash couch hissed as they absorbed the momentum. He'd split his knuckle. A drop of blood welled on his skin, growing to the size of a dark red marble, the surface tension pulling it out along his skin as he watched. When he moved, he left a spray of droplets hanging in the air like little planets and moons.

"You know," Naomi said, "if you're looking at hundreds of people burning to death as a problem solving itself, that may be more evidence that you're on wrong side."

"We didn't plant the bombs," Havelock said. "That was them. They started it."

"Does that matter to you?"

"At this point? Not as much as it probably should."

Naomi was floating close to her cage door. He was always amazed at a Belter's capacity to endure small spaces. Probably claustrophobia had been selected out of their gene pool. He wondered how many generations of Naomi's family had lived up the well.

"You're bleeding," she said.

"Yep. That's not going to matter much either."

"You know you could let me out. I'm a very good engineer, and I have the best ship out here. Get me back on the *Roci*, and I might be able to figure out a way to make things better."

"Not going to happen."

"And here I thought it didn't matter to you," she said with a smile in her voice.

"I don't know how you can be so calm about all this."

"It's what I do when I'm scared. And really, you should let me out."

Havelock gathered the blood out of the air. His knuckle had scabbed over already. He logged into the autodoc with the sick sense of taking the first step toward giving up. But it had to be done. A crew full of panicking people wasn't going to make anything better. Especially since the closest thing he had to a full staff was down on the planet with Murtry.

Havelock's newsfeeds from back home were filled with hyperbolic pieces about the tragedy at New Terra. The sensor data of the explosion had found its way to a few of the reputable feeds, but there were also three or four other forged versions out there too. The faked data wasn't particularly more impressive than the truth. He spooled through a dozen commentators.

Some of them seemed angry that the expedition had been allowed to go out, some were somber and sad. None of them seemed to think there was much chance of anyone surviving. His message queue had over a thousand new entries. People in the media. People from the home office. A few—just a few—from people he'd known. An old lover from when he was at Pinkwater. A cousin he hadn't seen in a decade and a half who was living on Ceres Station now. A couple of classmates from school.

There was nothing like dying publicly on a few billion screens to help reconnect with folks. He wasn't going to answer any of them. Not even the ones from his employers. Not even the ones from his friends. All of it felt like he was trapped underwater and drowning, looking up at the water's surface and knowing he'd never make it there.

He undid his straps.

"Goodnight, Havelock," Naomi said.

"I'll be back," he said, launching himself across the office.

It had been a long time since he'd done a patrol, even just an informal one. He pulled himself along the narrow corridors of the *Israel*, moved through the common spaces—commissary, gym, open lab, bar. In the months—years now—that he'd lived on the *Israel*, it had become invisible the way that anyplace did. Looking at it now was like seeing it for the first time. It was an old ship. The carefully symmetrical shape of the corridors, the keyed mechanism on the doorways. All of it was the kind of thing he'd seen in pictures of his grandparents. Seeing the people was much the same. There was a distance between security and the rest of the crew. If there wasn't, then something had gone badly wrong. Havelock didn't think of himself as being part of the *Israel*'s complement, but every face he passed he recognized. Hosni McArron, the food science head. Anita Chang, systems tech. John Deloso, mechanic. Even if he didn't know how he knew them, they were all part of the context of his life now.

And they were all going to die because he couldn't stop it from happening.

Forward observation was a dark room. The screens were built to give the illusion of looking out a window at the vastness of space, but no one ever actually used it that way. When he came in, it was empty. The screens were filled with sensor data spooling past too quickly to read, a musical composition by a dark-skinned Belter he didn't recognize, and a false-color

temperature map of New Terra. The security camera had a bit of cloth tacked over it and the air recyclers hadn't quite managed to clear out the smell of marijuana. Probably someone had been using it as a meeting place for sex. Havelock pulled the cloth free of the camera. Well, and why shouldn't they? It wasn't as if anything they did now was going to matter in three weeks. He shifted the screens to show the planet below them. New Terra, wrapped in clouds. No lights, no cities, no sign of the small, struggling human presence. The planet that had killed them all.

And still, it was beautiful.

His hand terminal buzzed. The red border of the incoming connection meant it was a security alert. Adrenaline hit his bloodstream and set his heart racing even before he turned it on. Marwick and Murtry were already in the middle of a conversation when he dropped in.

"—many of them, and I don't care to find out now," Marwick said. Shouted, almost. Murtry's expression seemed angry and dismissive, but Havelock realized it was only that he wasn't looking into the camera. He couldn't see it.

"What's going on?" Havelock asked.

"The *Rocinante*'s targeting us," Marwick said.

Havelock was already pushing himself off, moving fast through the corridor. "Are they making demands?"

"Backed up by *threats*," Marwick said, throwing up his arms.

"That's hyperbole," Murtry said. "They're painting the *Israel* with their targeting lasers. And some mad bastard's cutting through the midship maintenance airlock."

"We're being *boarded*?" Havelock said. He couldn't keep the incredulity from his voice. "By who? What's the point?"

"Motivation's not our concern right now," Murtry said. "Our priority is making sure the security of the ship is maintained."

Havelock grabbed a handhold at the intersection of two corridors and spun himself down, feet first, toward the junction that would get him back to his desk. "All respect, sir, you know they've got to be after the prisoner. Why don't we just give her to them? It's not like it's going to matter."

Murtry tilted his head. His smile was thin and cruel. "You're suggesting that we release the saboteur?"

"We're all dead anyway," Havelock said. And then there it was, spoken

aloud. The one thing that all of them were thinking. All of them but Murtry.

"You were immortal before we shipped out?" he asked, his voice dry and cold as a rattlesnake. "Because whether you're planning to die next week or seven decades from now, there's still a way we do this."

"Yes, sir," Havelock said as he reached the last turning and hauled himself down toward his office. "Sorry, sir."

The connection chimed as someone else joined. The chief engineer was grim-faced and angry in a way that Havelock immediately distrusted.

"Reporting for duty," Koenen said.

"Wait. What's he doing here?" Havelock said.

"I've included your militia in this," Murtry said as Havelock slid into his office. "If we're repelling boarders, we're going to need them."

"My men are ready," the chief engineer said, not missing a beat. "Just let us know where the sons of bitches are coming through, and we'll be there to meet them."

Oh God, Havelock thought. He's talking like he's in a movie. This is a terrible idea.

"Mister Havelock," Murtry said, "I'm going to ask you to open the live ammunition supply to the militia forces."

"With respect, sir," Havelock said. "I don't think that's a good idea. This isn't like a paintball exercise. We're looking at a real fight. The risk of friendly fire alone—"

Murtry's voice was calm and cool and viciously cutting. "Do I understand, Mister Havelock, that you've done such a poor job training these men that you feel we'd be safer repelling the attackers with paintballs?"

"No, sir," Havelock said. And then, to his surprise, "But I am saying issuing live rounds at this point would be premature. I think we should find out a little more about what we're looking at before we escalate that far."

"That's your professional opinion?" Murtry said.

"It is."

"And if I ordered you to issue these men live rounds?"

Naomi was at her cage, her fingers clutching at the mesh. Her eyes were wide and serious. Havelock looked away from her. Murtry's sigh was short and percussive.

"Well, I won't put you in a position where you have to choose," Murtry

said. “Chief?”

“Yes, sir?” the chief engineer said.

“I’m transmitting you my personal security codes. You can take weapons and ammunition from the armory with it. Do you understand?”

“Hell yes, sir,” the chief engineer said. “We’ll poke those bastards so full of holes you can see stars through them.”

“I’d appreciate that,” Murtry said. “Now if you gentlemen will excuse me.”

The connection dropped.

“What’s going on?” Naomi asked. The warm tone was gone from her voice. Now she actually sounded scared. Or maybe angry. He couldn’t tell. Havelock didn’t answer. The armory was off the main security station, not the brig. Even if he hurried, he wouldn’t be able to get there before the others. And if he did, he didn’t know what he’d say to them.

He had a gun cabinet here. Maybe if he joined in, he could at least control the situation a little bit.

“Havelock, what’s going on?”

“We’re being boarded, and we’re going to resist.”

“Is it the *Barbapiccola*?”

“No. It’s the *Rocinante*.”

“They’re coming for me, then.”

“I assume so.”

Havelock took a shotgun out of the gun cabinet.

“If it’s Alex and you shoot him, I won’t help you,” Naomi said. “No matter what happens after this, if he’s hurt, we’re done. Even if I find a way to save you, I’ll let you burn.”

The monitor chimed. A connection request from the planet. Havelock accepted it immediately. Doctor Okoye’s face appeared on the screen, her forehead furrowed and her eyes shifting as if she was looking for something. There was actually a glint of green in her pupils that made Havelock’s skin crawl.

“Mister Havelock? Are you there?”

“I’m afraid it’s not a good time, Doctor.”

“You’re coordinating the drops? I need to see if we can get—”

“Is this something where people are going to die if I don’t fix it in the next five minutes?”

“Five minutes? No.”

“Then it’s going to have to wait,” Havelock said and dropped the connection. The midship maintenance airlock was the closest to the brig. There would be choke points at the locker room, the emergency decompression hatch, and the intersection with the maintenance corridor. He guessed the chief engineer would set up his men at the second two and let the locker room go. He might send a couple men to the brig too, as a last ditch. He’d get pushback on that. The whole team was going to want to be in on the kill. And they’d have live ammunition. He wondered what the enemy would have. Power armor? Maybe. Maybe...

“We don’t have to do this,” Naomi said.

“I don’t like it any more than you do, but it’s how it’s coming down.”

“You’re talking about it like this is physics. Like there’re no choices involved. That’s crazy. They’re here for me. Let me go, and they’ll go too.”

“There’s a way we do this,” Havelock said, loading bag rounds into the shotgun.

“He said that, didn’t he? That was him.”

“I don’t know who you’re talking about,” Havelock said.

“Murtry. The big boss. Because you do that, you know? You listen to what he says and then say it like it was something you actually believe. This isn’t the time to do that. He’s wrong this time. He’s probably been wrong a few times before.”

“He’s not the one in lockup. I don’t know you’ve got a lot of right to brag.”

“That was dumb luck,” she said. “If you hadn’t happened to be out playing your war games, I’d have disabled your little bomb and been gone again before anyone knew it.”

“What good would it do if I let you go? It won’t make any difference. The ships are going down. There’s no one here who can help us. You can’t do anything to fix this.”

“Maybe not,” Naomi said. “I can die trying to *help*, though. Instead of trying to kill people or watching them die.”

Havelock’s jaw clenched. His finger pressed against the trigger guard and he closed his eyes. It would be so easy to turn the barrel on the cage. Fire a bag against the mesh and drive Naomi to the back of her cell.

Only he wasn’t going to do that. The release started in his chest and

spread out to his fingers and toes in less than a heartbeat. He pushed himself over to her and thumbed his code into the keypad. The cage clicked open.

“Come on, then,” he said.

OceanofPDF.com

Chapter Forty-One: Elvi

Scientific nomenclature was always difficult. Naming a new organism on Earth and even in the greater Sol system had a lengthy, tedious process, and the sudden massive influx of samples from New Terra would probably clog the scientific literature for decades. It wasn't just the mimic lizards or the insectlike fliers. Every bacterial analog would be new. Every single-celled organism would be unfamiliar. Earth alone had managed five kingdoms of life. Six, if you agreed with the Fityani hypothesis. She couldn't imagine that the ecosphere of New Terra would turn out to be much simpler.

But in the meantime, the thing living in her eyes—in all their eyes, except Holden's—wouldn't even officially be a known organism for years. Maybe decades. It would be officially nameless until it was placed within the larger context of life.

Until then, she'd decided to call it Skippy. Somehow it seemed less frightening when it had a silly nickname. Not that she'd be any less dead if she bumped into a death-slug, but at this point anything helped. And she was getting a little punchy.

The interesting thing—one of the interesting things—about the organism was that it didn't have chlorophyll or apparently anything like it. The green color came from a prismatic effect analogous to butterfly wings. The actual tissue growing in her eyes would have been a light brown that was almost clear if its structure had been even a little bit different. The scattering effect wouldn't happen. It also meant that her blindness was a flooding of color and a loss of detail, but it wasn't particularly dark. She could still close her eyes and see the world go black, and open them to the bright, vibrant green.

Anything else was beyond her now. Gone. She navigated her hand

terminal by voice commands, touch, and memory. The reports she would have skimmed through, she listened to now: voices from the labs at Luna and Earth and Ganymede. They didn't offer her much hope.

"While your immune subject does have a couple rare alleles in the genes regulating his sodium pumps, I'm not seeing anything in the final protein structure that's changed. The ion concentrations are stable and within the standard error bars. I'll keep looking, but I've got the feeling that we're barking up the wrong tree here. Sorry to say it."

Elvi nodded as if there were anyone there who could see her. The headache was still with her. It varied during the day, but she didn't know if that was part of the infection or just her experience.

"Hey," Fayez said. And then, "Elvi? Are you here?"

"I am," she said.

"Well, keep talking a little. I've got food on both hands."

Elvi hummed a pop melody from when she'd been a child and listened for Fayez's shuffling feet, reaching out to touch his calf when he was near. He folded himself down beside with a soft grunt. Her hand found his, and he gave her the rations packet.

"My next assignment," he said, "I'm working somewhere with maybe half Earth gravity. Weight. Who needs it?"

Elvi chuckled. He wanted her to, and she even meant it a little. The foil was slick under her fingertips. She felt like she was a little girl sneaking snacks under the covers when she was supposed to be asleep, doing everything by touch. The wrapping of Fayez's bar crinkled brightly.

"How much more food do we have?" she asked.

"Not much. I think they're trying for one more drop, though. There are a couple people who can still make out some shapes."

"And Holden."

"The one-eyed king," Fayez said. "We should poke out one of his eyes just to make that fit better, don't you think? Him having two eyes is a real missed opportunity."

"Hush," she said, and the foil gave way under her fingers. The emergency bar was crumbly and smelled like rat food from her days at the labs. It tasted unpleasant and nutritious. She tried to savor it. It wouldn't be long before she missed this.

"Any luck?" he asked. She shook her head by reflex. She knew he

couldn't see it.

"The best theory we had was that it was related to the plural parentage. He's got something like eight mothers and fathers, and the techniques to manage that can leave some systemic traces. But nothing so far."

"Well, that's a shame. Maybe all the exposure to the protomolecule changed him into a space mutant."

She took another bite and talked around it. "You can laugh, but Luna's looking at that too. And they're trying to grow a fresh sample of the organism based on the sample data we sent. The early trials are showing some real self-organization."

"Kicking off another five hundred years of graduate theses," Faye said. "I don't think you have to worry about your legacy."

Fingertips brushed against her knee, the physical act of reaching out undercutting the cynicism of his words. She took his hand in hers, squeezing the pad at the base of his thumb. He shifted closer to her. She could smell his body. None of them had been able to bathe since the storm came, and they probably all reeked, but her nose had become accustomed to the worst of it. She only experienced his scent as an almost pleasant funk, like a wet dog.

"Not the one I'd have chosen," she said.

"And yet our names will live forever. You as the first discoverer of a new planet full of species. Me as the simple geologist who waited on you hand and foot."

"Why are you flirting?"

"Flirting's the last thing to go," Faye said. She wished she could see his face. "You do science. I hit on the smartest and prettiest woman in the room. Everyone has their ways of coping with the brutal specter of mortality. And rain. Coping with rain. My next assignment, I want someplace without so much rain."

In the next room, a child started crying. An exhausted, frightened sound. A woman—Lucia, maybe—sang to it in a language Elvi didn't know. She popped the last of the bar into her mouth. She needed to get some water. She wasn't sure how long it had been since the chemistry deck had pumped out a clean bag. If it wasn't time to switch out yet, it would be soon. Holden had said he'd come by and do it, but she wasn't sure that was true. He was dead on his feet already, and he didn't rest. Even when he needed to. Well,

she could probably figure out how to switch out a water bag she couldn't see.

"We shouldn't have come," Fayez said. "All those crazy bastards talking about how the worlds beyond Medina Station were going to be tainted and evil? They were right."

"No one said that, did they?"

"Someone probably did. If they didn't, they should have."

"You could really have stayed away?" she asked as she rose to her knees and started reaching for the chemistry deck. She could hear the soft ticking of the clean water coming through the outtake filter, a different timbre than the constant rain. "If they came to you with the chance to go to the first really new world, you'd have been able to say no?"

"I'd have waited for the second wave," Fayez said.

She found the bag. The soft, cold curve wasn't as heavy as she'd expected. The deck wasn't putting out water as quickly as it had been, but if there was an error in the system, it hadn't made a noise. Something else for Holden to check.

"I'd still have come," she said.

"All this? And you'd still have come?"

"I wouldn't have known about this. This wouldn't have happened yet. I'd know I was taking a risk. I did know. Of course I'd get on that ship."

"What if you knew it was going to be like this? What if you could look into some crystal ball and see us here, the way it's all happened?"

"If we could do that, we'd never explore anything," she said.

It was very strange to think that they were all going to die. She knew it, but it still seemed unreal. In the back of her mind, a small, insistent voice kept saying that a ship would arrive to help them. That another group on the planet would show up with extra food or water or shelter. She'd catch herself wondering if they shouldn't be signaling for help, and have to make the effort to recall that there were no other bases. No other ships. In the whole solar system, there were just the crews and passengers of three ships. And fewer now than there had been before. Even with all of them packed into the ruins together like refugees so close they could hear each other snore, it made the universe seem very empty. And frightening.

"We should find Holden," she said. "The water's coming slow. I wonder... Maybe he has a really good immune system? The fact that we're

all getting discharge means we've got some immune response to it. Like a splinter, maybe. It just grows faster than we can knock it out. Maybe Holden has some exposure that gives him antibodies to it."

"Did the blood scans find anything?"

"No," she said. "His white cell count is lower than ours too."

"Maybe his eyeball juice tastes bad," Fayez said. "What?"

"I didn't say anything."

"No, but you made that little I've-got-an-idea grunt. I've heard that grunt. It means something."

"I was just thinking that it can't be his immune system," she said. "I mean, we're all traveling in hard vacuum all the time. The radiation just on the way out here probably left all of us a little immunocompromised. And especially after Eros Station, he's had more... more radiation damage..."

Elvi closed her eyes, shutting out the green. A beautiful cascade of logic and implication opened before her like stepping into a garden. She caught her breath, and grinned. The joy of insight lifted her up.

"What?" Fayez said. "He's overcooked? The eye thing only likes us rare, and he's well done?"

"Oh," Elvi said. "It's his oncocidals. After the Eros incident, he had to go on a permanent course of them. And that means... *oh!* That's so *pretty*."

"Oh good. What are you talking about? Why would his anti-cancer meds work on something from a different biosphere?"

"It means there's a Dawkinsian good move down around cell division somewhere."

"That's one of those xenobiology things, isn't it? Because I've got no idea what you're on about."

Elvi patted her hands in the air. The pleasure running through her blood felt like being carried by light.

"I told you about this," she said, "that there are good moves—maybe even forced moves—in design space because we see things that show up again and again all through different branches of the tree of life."

"Right," Fayez said. "Which is why we can come to New Terra and find things that have eyes and stuff."

"Because bounced light has a lot of information in it, and organisms with that information do better."

"Preaching to the choir, Elvi."

“But that’s not the good part. Holden’s on medications that selectively address fast-dividing tissues. Skippy’s a fast-dividing tissue.”

“Who’s Skippy?”

“The organism. Focus here. That the onococidals work against it means there’s something like flight or sense organs near the mouth that’s going on at the level of cell division. Even though the proteins are totally different, the solutions they’re coming up with are analogous. That’s the biggest thing since we came here. This is huge. Where’s my hand terminal? I have to tell the team on Luna. They’re going to lose their *minds*.”

She moved forward too quickly, stumbling into Faye. He pressed the terminal into her hands. She sat beside him.

“Are you bouncing up and down?” he asked. “Because you sound like you’re bouncing.”

“This is the most important thing that’s happened to me in my life,” she said. “I’m *floating*.”

“So this means we can treat the eye thing, right?”

“What? Oh. Yeah, probably. It’s not like onococidals are hard to synthesize. Just most of us don’t need a constant course the way Holden does.”

“You are the only woman I have ever known who would figure out how to keep a bunch of starving refugees including herself from going blind and be excited because it means something about microbiology.”

“You should get out more. Meet people,” Elvi said, but she felt a little pull of guilt. She probably should try to get people treated before she started talking to the team on Luna. It was still just a hypothesis anyway. She didn’t have any data yet. “Connection request Murtry.”

Her hand terminal chimed that it was working. A gust of wind made the plastic window flutter. It sounded a little different than usual, and the constantly falling rain sounded louder. She wondered if the sheeting might be coming unsealed. There could be death-slugs creeping around the room and she wouldn’t have known. Wouldn’t have seen them. Something else she’d have to ask Holden to check. The double-tone of connection refused made her grunt.

“Who’s working on the drops?” she asked.

“Upstairs? Um. Havelock, I think.”

“Connection request Havelock.”

The hand terminal made a single chime and then stopped. She wasn't sure if it had gone through or failed.

"Mister Havelock? Are you there?" she asked.

"I'm afraid it's not a good time, Doctor."

"You're coordinating the drops? I need to see if we can get—"

"Is this something where people are going to die if I don't fix it in the next five minutes?"

"Five minutes?" she said. "No."

"Then it's going to have to wait." The hand terminal made the falling tone of a dropped connection.

"Well, that was fucking rude," Fayez said.

"He probably has something else going on," she said.

"We're all under a little stress here. Doesn't mean he has to be a dick about it."

Elvi lifted her eyebrows and nodded, knowing as she did that he couldn't see her. "Connection request Holden."

The tones cycled until she was afraid he wouldn't answer either. When he did, his voice sounded terrible. Like he was drunk or sick. "Elvi. What's the matter?"

"Hi," she said. "I don't know if you're busy right now, and you're not really responsible for getting supplies to us, but if you have a minute, I'd like to—"

Fayez shouted, interrupting her. "She knows how to make us not blind."

There was a pause. Holden grunted. She imagined it was the effort of standing up. "Okay. I'll be right there."

"Bring Lucia," Elvi said. "If you can find her."

"Is Murtry going to be there?"

"He's not answering my connection requests."

"Hmm," Holden said. "That's good. I don't think he's happy with me right now."

Lucia sat at Elvi's side, holding her hand. It should have felt like an intimacy, but in context, it only seemed to indicate that she was giving Elvi her full attention. A physical analog to eye contact. Holden was pacing

around the room, his footsteps sticky-sounding with the mud.

When she was done, Lucia made a ticking sound with her tongue and teeth. “I don’t know how we’d manage dosages. I don’t want to give people so little that it doesn’t have an effect.”

“What about picking babysitters?” Fayez said. “A dozen people whose cases aren’t as advanced. Shoot them up. They can take care of the rest of us until there’s another drop. Captain?”

“What? Oh, sorry. I was... um. There’s a hole in the window. Plastic. I was just making sure there weren’t any death-slugs in here. And fixing it.”

“Captain,” Lucia said, her voice sharp and crisp. “You’re taking medications for a chronic and potentially terminal condition. We are discussing whether or not to use your medication to treat other patients and leave you without.”

“That’s fine.”

“Ethically, it’s actually a little problematic,” Lucia said. “If I’m going to do this, and I very much want to, I need to know that you understand—”

“I do, I do, I do,” he said. “I’ve sucked down enough radiation that I bloom tumors a lot. The thing that keeps it under control does that thing with the other thing. And then there are other people and I can take a nap.”

Elvi could hear Lucia’s smile when she spoke. “I’m not sure the human subjects board would call that sufficient, but broadly yes.”

“Of course you use it,” he said. “Use it, go ahead. We’ll get more if we can.”

“And if we can’t?”

“I might get a new tumor before we starve. I might not,” Holden said. “I’m okay with that.”

Lucia took back her hand, leaving Elvi’s feeling a little colder. “All right, then. We should start. Can you guide me please, Captain?”

“Yes,” Holden said. “Yes, I can. But we may need to get a cup of coffee. I’m feeling a little tired.”

“I can get you some stimulants if you’d like, but there’s no coffee.”

“Right,” Holden said. “No coffee. This is a terrible, terrible planet. Show me how to make everyone better.”

Chapter Forty-Two: Havelock

The armor in the brig was a simple, unpowered suit of Kevlar and ceramic. It was vacuum rated and had a fitting for a half-hour air bottle. Its intended uses included breaking up brawls among the crew and making short, tactical spacewalks. There were probably a dozen more like it up in the main security station. He hoped that the engineers didn't think of them. When Havelock stepped into it, it pulled his pant legs up, bunching the cloth uncomfortably at the crotch. He put the shotgun strap over his shoulder and shifted, using both hands to pluck the pant back into place.

Laughter doesn't help," he said.

"Wasn't laughing," Naomi replied, then laughed.

He took a fistful of disposable handcuffs and two Tasers from the gun locker. One had a full charge, the other was at three-eighths. He made a mental note to check the batteries on all the weapons later, then remembered that there probably wasn't going to be a later. Not for him, at least. He could leave a note for Wei or something. He thought about calling Marwick, warning him that things were getting complex. Relying on the man's decency and instincts.

He didn't do it.

Naomi, floating behind him, stretched out, her fingers and toes splayed in the open air. Her paper jumpsuit crinkled and popped with every motion. Havelock looked around his office one last time. It was strange, knowing he probably wouldn't see it again. And if he did, it'd be from the inside of the cage.

If that happened, though, it would be because they'd found some way to keep from dropping into the atmosphere, burning in the high air. So the

chances were low. He wasn't going to worry about it.

"First mutiny?" Naomi said.

"Yeah. It's not really something I do."

"It gets easier," she said, holding out her hand. He looked at it in confusion. "I can take one of those."

"No," he said, tuning the suit comm unit to the channel the training group used as a default. There was no chatter at all. That was odd. He cycled through the other frequencies.

"No?"

"Look, I'm getting you out of here. Doesn't mean I'm comfortable handing you a weapon and turning my back."

"You have interesting personal boundaries," Naomi said.

"I may be working through some things right now."

The first militiaman flew through the doorway too fast, pumped on adrenaline and unaccustomed to having a gun in his hand. The second came just behind him, feet first. Havelock felt his gut go tight. They both had pistols in their hands and armbands around their biceps. Naomi, behind him, took a breath.

"Gentlemen," Havelock said with a nod. "How can I help you?"

"What the hell do you think you're doing?" the first one demanded, trying to bring his gun to bear and steady himself against the wall at the same time.

"Moving the prisoner," Havelock said, his voice pitched just between contempt and incredulity. "What else would I be doing?"

"Chief didn't say anything about that," the second one said.

"Chief Engineer Koenen isn't head of security on this ship. I am. You guys are helping me. Don't get me wrong, I appreciate it, but keep in mind that this is what I do, all right? What the hell are you two doing here?"

They exchanged a glance. "Chief told us to come guard the prisoner."

Naomi smiled and looked demure and non-threatening. She faked it pretty well.

"Good plan," Havelock said. "This is where they'll be coming. You two set up here in case they get through. Once I've got this one safely stowed where they won't find her, I'll come reinforce you."

"Yes, sir," the second man said, making a sharp salute with the same hand that had the gun in it. Havelock flinched. These guys were so not

ready for live rounds. Havelock pulled the shotgun to ready and racked it.

“Miss Nagata,” he said. “If you’d be so kind.”

“Yes, sir,” she said meekly and pushed off for the door.

He followed, catching himself on the doorframe and turning back.

“If anyone comes through, identify them before you start shooting, all right? I don’t want anyone to get hurt by mistake.”

“We will, sir,” the first one said. The second one nodded. Havelock would have wagered half his salary that they’d been planning to open up on anyone that came through the door. Naomi waited for him just down the corridor. He put the shotgun’s safety on and let it trail from his shoulder. All the corridors in the *Israel* were narrow, but more so here. The nearer you got to the outside, the tighter the space became. The cloth and padding along the walls ate the sounds of the ship. Numeric codes printed on the material listed what conduits and technical systems were buried in the bulkhead underneath them, the model of panel, and their replacement dates. The idea behind the foam and cloth was to make everyone safer in case of a collision or unexpected burn. Right now, it made him think of a padded cell.

Havelock nodded back over his shoulder. “If something happens, don’t go back there without me.”

“Hadn’t planned on it.”

They moved down the corridor, Havelock taking lead and gesturing her forward. She didn’t move with the tactical instinct of someone trained to do it, but she was smart and quiet and caught on quickly. She also had a Belter’s grace in zero g. If he’d had a few weeks with a squad of people like her, he’d have given them live rounds. At the wall before the intersection with the maintenance corridor, he gestured to the thin ceramic lip of the bulkhead.

“Stay here,” he whispered. “And stay small.”

Naomi lifted her fist. Havelock moved forward. At the intersection, two more of the team were braced in what they probably thought was a cover position. One of them was solid. The other had his hand too far forward. If he tried to push off, he’d get a backspin that would turn him away from the fight. They’d been over this.

“Gentlemen,” Havelock said as he slid forward through the air. “Walters and... Honneker, right?”

“Yes, sir,” Honneker said.

“What’s our situation?”

“Chief called for radio silence. Don’t want to warn the enemy what we’re up to. We’ve got Boyd and Mfume at the decompression hatch. Chief’s got Salvatore and Kemp. They’re going forward to flush the bad guys out.”

“Who do we have outside?”

“Outside?” He shook his head, uncomprehending.

“Did we put anybody in suits and send them out the other airlocks?”

“Hey,” Honneker said, “that’s a good idea. We should do that.”

“So didn’t do it already,” Havelock said.

“No, sir. Didn’t think of it.”

“All right,” Havelock said, and the dry rattle of gunfire echoed from down the corridor. The two engineers turned, pulling themselves to look. Honneker pulled a little too hard, launching himself into the corridor where anyone coming the other direction could have shot him while he flailed. The radio clicked to life in Havelock’s ear. The chief engineer sounded like a kid at a birthday party.

“We have contact! We have contact! The enemy’s taken cover in the lavatory by secondary supply. We have him pinned down!”

A flurry of shots rang out, coming through the radio a fraction of a second before the sound could move through the ship’s air. Koenen started shouting at someone to pull back, then realized his radio was still live and cut it. Havelock braced his ankle in a handhold, stretched out to Honneker, and pulled him back in gently.

“What do we do?” Walters said as Honneker steadied himself on a handhold. “Should we go forward? We could grab some suits and go around like you said?”

Havelock took out the fully charged Taser, shaking his head. It was ready to fire. The second one, with the low charge, took half a second to go to ready status. The two men were looking at him for guidance.

“You should both look down the corridor,” Havelock said, pointing at the intersection with his chin. When they turned, he shot them both in the back. Their bodies arched, shuddered, and went still. Havelock took their pistols, disabled their suit radios, and handcuffed them first to each other, and then to one of the handholds.

“Clear,” he said over his shoulder, his voice calm but strong enough to

carry. Naomi moved forward, shifting from one side of the corridor to the other so that she was never more than a fraction of a second from something solid she could use to change direction. Good instincts.

“That’s four down,” she said. “Are you really good at this, or are they really bad?”

“Teaching may not be my strong suit,” Havelock said. “And we do have the element of surprise on our side.”

“I guess,” Naomi said, her voice making her skepticism clear. “How are you doing?”

Havelock started to say *I’m fine* by reflex, and then paused. He had just attacked and disabled two of his crewmen who’d been working at the direct and explicit order of his superior officer. He’d betrayed the trust of men he’d been traveling with for years on behalf of a Belter saboteur. And they were all of them days from dying. And, maybe oddly, it was that last fact that made all the rest all right. He was a dead man. They were all dead men. So there was a sense in which what he did now didn’t matter. He was free to follow his conscience wherever it led.

It was the security man’s nightmare scenario. In the face of death, why wouldn’t there be riots? Why wouldn’t there be killing and theft and rape? If there were no consequences—or if all the consequences were the same—then anything became possible. It was his job to expect the worst of humanity, including himself. And now here he was, helping a lawfully bound prisoner escape because he liked the death she offered him better than Murtry’s plastic-and-ceramic sepulcher standing on an empty planet. He didn’t give a good goddamn about New Terra or Ilus or whatever the unpleasant ball of mud under them got called. He cared about the people. The ones on the *Israel* and the ones on the *Barbapiccola* and the ones on the surface. All of them. Staking a claim that the corporation could use to protect its assets after they all died just wasn’t good enough.

“I’m weirdly at peace with this,” he said.

“Probably a good sign,” she said, and a fresh round of shooting started. Havelock gestured for her to stay and pushed forward.

All the major corridors on the *Israel* had decompression hatches: thick circles of metal with hard polymer seals. Most of the time they were bumps in the walls, larger than the ship designs a generation or two later, but easy enough to ignore. If something holed the ship, the hatch would close with

the speed and amorality of a guillotine. If someone got caught in it, one loss was better than venting the air. Havelock had seen training videos about misfires, and he'd been nervous around them ever since. One man was pressed to the wall, eyeing the corridor ahead anxiously. Havelock cleared his throat, and the man spun, pistol at the ready.

"Mfume," Havelock said, his palms up. "Where's Boyd?"

"He went forward," Mfume said, gesturing with the gun, but not lowering it. "The chief's getting shot at. And he told me to stay here. And I stayed, but—"

"It's all right," Havelock said, moving closer slowly, not making eye contact. He kept looking down the corridor, trying to shift the man's attention there. The raised pistol made his chest itch. "You did the right thing."

The radio crackled back to life, and the chief engineer spoke. He sounded winded. "We've locked the little bastard down. He winged Salvatore, but it's not bad. I need everyone up here. We're going to rush him."

"That's probably not a good idea," Havelock said on the open channel.

"It's all right," the chief engineer said. "We can take him."

"Not without casualties that you don't have to take," Havelock said. "Is he in armor?"

"Yeah, I'm pretty sure I got one hit on him," another voice said, its tone high and tight, like a kid on his first hunt who thinks he shot a deer.

"Everyone check in," the chief said.

"Jones and I are in the brig, chief. Everything's quiet."

"Prisoner giving you any shit?" the chief asked.

"I moved her," Havelock said. "She's fine. I need you to pull back now. We have to do this by the numbers."

Another half dozen gunshots peppered the air. Mfume twitched with each of them. Havelock gently pushed the barrel of the man's gun away until it pointed at the wall. Mfume didn't seem to notice he'd done it.

"No can do," Koenen said. "If we let up, this Belter sonofabitch is going to get loose. We've got to finish this thing. Honneker! Walters! Get your nuts in your palms and head forward, boys. This piece of shit is going down."

The silence on the radio was eerie.

“Walters?” the chief engineer said.

Havelock took Mfume’s wrist and twisted, bracing one leg against the wall for leverage. Mfume cried out, but he loosened his grip on the gun enough for Havelock to bat it away. The black metal spun down the corridor, and Mfume yelled and tried to push him away. Havelock shifted his grip, pulling out and down, peeling Mfume away from his bracing wall. The engineer screamed again, and Havelock fired the Taser into his back. Mfume bounced against the far wall, limp as a puppet, and Havelock pulled the shotgun off his back and shifted to jam one knee against the lip of the decompression hatch and the other foot behind him against a handhold.

“Nagata,” he shouted. “We’re about to have company.”

Down the corridor, the chief engineer boiled around the corner and slammed into the wall, firing his pistol wildly.

“Cease fire!” Havelock called. “You’ve got one of your own floating outside cover. Cease fire!”

“Fuck you!” Koenen shouted, and Havelock pulled the shotgun’s trigger. The bag round took the chief in the side and sent him spinning. Havelock landed the second shot in the man’s back just as three more engineers caromed around the corner in a clump. Havelock shot each of them once, then shifted himself to the other side of the hatch and pushed off, stowing the shotgun and pulling the Tasers. The low-charge one was already dead, and he dropped it. One of the men was bleeding; a droplet of blood the size of a fingernail floated in the air. All four men were gasping in pain. Two of them had dropped their weapons, and the other two—the bleeding man and Koenen—seemed unaware Havelock was there at all. Havelock Tased the first of the floating men, then grabbed the one who was bleeding, Salvatore.

“You. Kemp.”

“You shot me.”

“With a bag round. The other guy shot Salvatore with a bullet. You need to get him to the medical bay.”

“You’re a *traitor*,” the chief engineer shouted, and Havelock Tased him before turning back to Kemp.

“I’m taking your gun away, and I’m giving you Salvatore. You’re helping him get to the medical bay now. You understand?”

“Yes, sir,” Kemp said, then looked over Havelock’s shoulder and nodded. “Ma’am.”

“Everything under control?” Naomi asked.

“Wouldn’t go that far,” Havelock said, putting Kemp’s hand on Salvatore’s arm and giving them both a little shove back up the corridor. “I’m fairly sure the two from the brig are on their way down here.”

“We should leave, then.”

“That’s what I was thinking.”

The short stretch of corridor between the corner and the airlock had a sealed door to secondary storage, a low access panel to the power conduits in the walls, and the entrance to the maintenance airlock’s locker room. The space was narrow and cramped. Bullet holes pocked the cloth. One of them had penetrated the wall and hit a hydraulic tube. The safety hydraulic fluid was polymerizing in the air, a hundred tiny greenish dots slowly turning white. The original leak was probably already sealed with a hunk of the stuff. The washroom was the standard utility size, so small that squatting on the vacuum seat meant pressing back to one wall and knees to the other. It wouldn’t have been much for cover in the first place, and the narrow door stood open. A dozen bullet holes scarred the walls and the doorway.

“Okay,” Havelock said, and a gun popped out, firing blind down the hallway. He pushed Naomi behind him, shouting, “Stop! Stop! I’ve got Nagata right here!”

“Stay the hell back!” a man’s voice shouted from the washroom. It sounded almost familiar, but Havelock couldn’t place it. “I swear to God I’ll shoot.”

“I noticed,” Havelock shouted back.

“It’s okay, Basia,” Naomi called. “It’s me.”

The voice went silent. Havelock moved forward slowly, ready for the gun to reappear. It didn’t. The man floating in the washroom wore military body armor of a Martian design that was maybe half a decade out of date. His hair was dark with flecks of gray at the temples, and he had a welding torch in one hand. The gun was in the other. His eyes were wide and his skin was ashy. A streak across the side of the armor showed where one of the militia’s bullets had skipped off his ribs. Havelock put up his left hand, palm out, but kept the Taser tight in his right.

“Okay,” he said. “It’s all right. We’re all on the same side here.”

“Who the hell are you?” the man demanded. “You’re the security guy. The one that locked her up.”

“Used to be,” Havelock said.

Naomi put her hands on Havelock’s shoulders, pulling herself over him to see the other man.

“We’re leaving,” she said. “Want to come with?”

OceanofPDF.com

Chapter Forty-Three: Basia

We're leaving," Naomi said. "Want to come with?"

Basia felt a powerful flush of embarrassment. Things had started out so well.

He'd cut into the *Israel's* airlock control panel with the efficiency of long practice. The composite plating had been an old layering system he'd seen often working on Ganymede, and the familiarity had given him a sense of confidence. He'd floated through the short corridor to a storage and locker room without seeing a soul, clutching his pistol in one hand. He'd hoped the weapon would turn out to be unnecessary. On the other side of the locker room was the starboard passageway that would lead to the brig. He was about sixty meters from his goal, and not even an alarm had gone off.

His first sign that things were going wrong was a massive barrage of gunfire that seemed to come from everywhere at once. He'd been hiding in the tiny lavatory closet ever since.

"I came to rescue you," Basia said, recognizing how silly the words sounded even as he said them.

"Thanks for that," Naomi replied with a smile.

"Yeah, so, we should probably keep—" the Earther in the body armor started to say, then was cut off by a new fusillade of shots. Bullets bounced off the corridor walls, tearing strips of foam off to join the floating blobs of solidified hydraulic fluid. The Earther shoved Naomi into the lavatory with Basia, mashing them both against the back wall. More shots hit, including one that skipped off the Earthman's shoulder plating, leaving a long dented streak.

“I’m Basia,” he said.

The Earther leaned around the doorway with a bulky rifle of some kind and fired several booming shots. “Havelock. Let’s cover the rest once we’re out of here.”

Before Basia knew she was going to do it, Naomi plucked the pistol out of his hand and held it out to Havelock. “You might need this.”

“No,” he replied, and fired off his big rifle a few more times. “No lethal rounds. We’re not killing these idiots if we can avoid it.”

“Then what?” she asked.

Havelock was pulling fat shotgun shells out of a pouch on his armor and loading them into his gun. “As soon as I move into the corridor, you two head to the airlock as fast as you can.” He loaded one last shell into the gun, then racked it with a loud clack. “Basia, you’re armored, so keep her in front of you. Naomi, you’ll be moving through a storage compartment. Grab a suit. Anything you can put on fast.”

“Ready when you are,” Naomi replied and put a hand on Havelock’s shoulder. Basia nodded his fist at the Earthman.

“Then go,” Havelock said and darted into the corridor firing his shotgun. Naomi followed him out and turned the other direction, toward the locker room and the airlock; Basia stayed right behind. They’d only gone a few meters when he felt two bruising hammer blows on his back.

“I’m shot!” he yelled in a panic. “I got shot!”

Naomi didn’t slow down. “Is your HUD telling you you’re bleeding out?”

“No.”

“Then you’ll live. That’s what the armor is for.”

“Less talk,” Havelock said from right behind him, and gave him a shove in the back. “More escaping.”

Basia hadn’t even known he was there. He stifled an undignified squeak. Several meters ahead, Naomi darted into the storage room, and Basia followed when he reached the doorway. She was already wriggling her way into a bright orange emergency atmosphere suit. Havelock paused at the door to fire several more shots down the corridor.

“Tune to twenty-seven oh one five,” the Earther said.

“What?” The words made no sense to Basia. And the whole sequence of events was more and more coming to feel like a bad dream. People shooting

and spouting nonsense at him. The sense of peace and heroism he'd felt when he agreed to the rescue mission was entirely gone.

"It's the frequency the security team's using," Havelock said. "You can listen in. They aren't encrypting. Because"—he sighed—"they're fucking amateurs."

Basia found the menu to switch his suit's radio frequency and set it to 27.015. "—in on it," a voice said. Young, male, angry.

"The fact that he's shooting back at us makes it pretty goddamn clear," an older voice said. "He shot me with a couple fucking beanbag rounds. I think he broke a rib."

"So," Havelock said, then paused to fire off another shot. "I guess this is a decision I don't get to take back." Basia couldn't tell who he was talking to.

"I'm gonna shoot you in the face, asshole," the older man said. This was followed by another barrage of gunfire that tore up the hallway.

"Mostly you're shooting the ship, chief," Havelock replied. His voice was matter-of-fact. He seemed halfway between being embarrassed on the attacker's behalf and steeled for more violence of his own. Basia remembered someone telling him about the idea of *Bushido* back when he'd first signed on for work on Ganymede. They'd said it was the peace and effectiveness that came from already thinking of yourself as dead. Havelock reminded him of that.

"Kemp," the older voice said. "Are you in position?"

"We're suited up and moving to emergency access one eleven," a voice replied.

"Go faster, get ahead of them."

"Hey Kemp?" Havelock said. "Thought I sent you to medical with Salvatore? You didn't leave him bleeding out in a corridor somewhere, did you?"

"No, sir," Kemp replied. "Someone's taking him there now—"

"Stop talking to him!" the angry older man said. "He is not on our team!"

Naomi was struggling to get the emergency suit over her shoulders, and Basia pushed over to help her. Havelock stayed at the locker room hatch, occasionally firing down the corridor.

"Find an air bottle," Naomi said, then started opening locker doors and

rummaging through the contents. Basia helped.

“Hey, Mfume?” Havelock said.

“What?” a new voice snapped.

“Turning on your boot mags to stick to the floor behind cover is a good instinct. But in the position you’re crouched in, your knee is sticking out past the corner.” Havelock fired a shot from his shotgun, and someone on the radio screeched in pain. “See?”

Basia found a locker full of emergency air bottles and helped Naomi connect one to her suit, twisting it to break the seal. A few seconds later she gave him the thumbs-up.

“We’re ready to go,” she told Havelock.

The Earther fired off a few more shots, then backed into the locker room with them. He handed his shotgun to Naomi, who pointed it at the doorway to cover them while the two men sealed their helmets.

“Changed your mind about giving me a gun?” Naomi asked.

“I’ll want it back.”

“We’re ready out here,” Kemp said on the radio.

“Hey, guys?” Havelock said. “Don’t do that. We’d barely started on the spacewalk combat tactics. You head out there with live ammo and it will get really dangerous.”

“Well, the chief said—”

“Stop talking to him!” the older man yelled, loud enough to distort Basia’s helmet speakers. “Goddammit you guys!”

“Koenen,” Havelock said. His voice sounded subtly different now that his helmet was on and sealed. “I’m serious. Don’t send your guys out there. Someone’s going to get hurt or dead.”

“Yeah,” the chief replied. “You Belter-loving traitorous sonofabitch.”

“How’re those ribs, chief?” Havelock said, a smile in his voice. “You see, right now, you’re acting out of anger. Not thinking it through. This is why I didn’t want to break out the live rounds.”

Basia strapped on the EVA pack he’d left by the airlock hatch. Naomi handed him the shotgun and pulled two more packs out of storage. A moment later, she and Havelock were wearing them and the inner airlock door was cycling closed. Havelock took the shotgun away from Basia and hung it from a strap on his harness. Naomi started the airlock cycle.

“You know,” she said, “they can just kill this airlock from the bridge.”

As if in response to her words, the airlock status light on the control panel shifted to red, and the cycle stopped. Havelock punched something into the panel and it started again.

“They won’t have had time to reset all the security overrides,” he said.

“RCE security can countermand ship operations?” Naomi asked.

“Welcome to corporate security. The ship’s crew are glorified taxi drivers. Security division works directly for the company, protecting its interests. We can override anything they do.”

“This is why everyone hates you,” Basia said.

The airlock cycle completed, and the outer door opened. Havelock gestured them out. “You sure you don’t like me right now? Just a little bit?”

Ilus’ star was just peeking around the limb of the planet, and Basia’s visor dimmed dramatically to keep it from blinding him. The planet itself was the same angry ball of storm-wracked gray clouds. In the distance, the *Rocinante* flashed green and red landing lights at them, marking its position.

“Okay,” Havelock said, his voice crackling with low-level static. “Should probably get moving. They’ve got guys outside on the other side of the ship. They can’t catch us, but watch each other for grapnel lines.”

Naomi was already firing her EVA pack, moving out of the airlock on four small white cones of compressed gas. “Alex? We’re out.”

“Oh, thank God,” the pilot said, his drawl mostly disappearing in the tension of his voice. “I’ve been worried sick over here. Basia with you?”

“Yeah,” Basia said. “I’m here.”

“You’ll be picking up three,” Naomi said. “Come get us.”

“Three?”

“Taking a stray home with me.”

“A stray?” Havelock said, amusement in his voice. “I’m the one doing the rescuing here.”

“It’s complicated,” Naomi continued. They were all out of the airlock now. The remote connection light went on in Basia’s HUD, and a complex program began spooling across it. Alex having the *Rocinante* take control of their EVA navigation to bring them to the ship. The pack did several sharp burns, and the *Rocinante* began slowly growing.

“Glad Basia made it okay,” Alex said. “Worried sendin’ him in there like that.”

"I didn't wind up helping much," Basia admitted, feeling that same rush of embarrassment.

"You got everyone looking in the wrong direction," Havelock said. "That was actually pretty helpful."

"Yay," Alex said, "we're all heroes. There're four guys tailing you right now. Do we know about them?"

A small box appeared on Basia's HUD. Inside it was video of four people in vacuum suits and wearing EVA packs, the bulk of the *Edward Israel* behind them. Without his doing anything, the view zoomed in until he could see the weapons they were carrying. Alex was sending them all images pulled from the *Rocinante*'s telescopes.

"Yeah, those are the militia I formed and trained," Havelock said, then sighed. "In retrospect, that's seeming like a bad idea."

"Do you want me to take care of that?" Alex asked.

"Does your version of 'taking care of it' involve your ship's point defense cannons?" Havelock replied.

"Uh. Yeah?"

"Then no. These guys are dumb and untrained enough to still be gung-ho. But they're just engineers. They're not bad guys," Havelock said.

"They're shootin' at you," Alex said, and suddenly Basia's HUD had red lines across it. "Got the *Roci* trackin' bullet paths."

The knowledge that there were silent, invisible, and potentially deadly projectiles flying past him made Basia's scalp tingle. The red lines on the display apparently meant more to Havelock, because the Earther said, "They're nowhere near us. They haven't got HUD-integrated targeting, so they're just spraying and praying right now. There's no reason to return fire."

"XO?" Alex said. It took Basia a second to realize he was talking to Naomi.

"Havelock's calling this one," she replied. "They're his people."

"Okay," Alex said doubtfully.

The *Rocinante* continued to grow minute by minute until Basia could see the tiny ring of lights around its airlock. He'd only been on the ship a short time, but it felt like coming home. His EVA pack fired off a quick series of blasts and spun him around to face the *Israel*, then began braking. Almost there.

“Guys,” Havelock said. “Recoilless is an exaggeration. It doesn’t mean there’s no recoil at all.”

It sounded like more nonsense talk to Basia until he looked at the *Rocinante*’s video of the pursuing team and saw one of the four men spinning and rotating in space, frantically firing his EVA pack to get under control. It only seemed to make it worse, as every blast of gas from the pack just added a new axis to the rotation.

“Then that’s an inaccurate name for the weapons,” the man called Kemp replied.

“And if we’d gotten to more advanced zero-g tactics, I would have explained that,” Havelock said. “I also would have taught you to use the integrated compensation software to have the EVA pack do stabilizing bursts every time you fire the gun.”

“Seems to me there’s a lot you didn’t show us,” Kemp replied.

“Yeah, and now that you’re shooting at me, I’m just sick about that. In the meantime, please stop. Drake is way out of control and drifting away from you guys. Someone needs to go get him before he gets too far.”

“You’d like that, wouldn’t you?” the one Havelock had called Koenen said. “Get us to call off the chase.”

“I’d like,” Havelock said, his voice sad, “to keep Drake from falling out of space and dying. Also, I’m arguing with the pilot of the gunship behind me so that he *doesn’t* need to turn you into a cloud of red mist with his point defense cannons. But you guys are making it harder and harder to be convincing.”

“Don’t threaten—”

“Go get Drake. Get back in the ship. Stop shooting. If one of those shots you’re spraying around accidentally hits, I’m taking the gunship off the leash.”

There was a long silence. The red lines on Basia’s HUD began disappearing one by one until none were left. The EVA pack fired off one long, final burst, then spun him around. The outer airlock door of the *Rocinante* was already open, waiting for them. Naomi drifted inside, grabbed a handhold, and waited for them to follow. Shaded from Ilus’ star the polarization of her faceplate faded, and the blue glow of the airlock’s LED lights illuminated the inside of her helmet. Her wide smile was clearly visible.

“Home again, home again,” she said. Basia drifted in next to her and she caught his arm to stop him. “Thank you for coming for me.”

Basia blushed and raised his palms in a Belter shrug. “I didn’t do much but get shot at.”

“Sometimes just showing up is a lot.”

Havelock caught the edge of the airlock entrance and stopped, looking back toward the *Israel*. “Hey, you got Drake? He okay?”

“Yes, sir,” Kemp replied. “We caught him.”

“Havelock,” the older, angrier voice said. “You won’t get away with this. RCE will burn you to the ground when we get back. And I’ll be there to see it happen.”

Havelock laughed. “Chief? I hope we both live so long. Havelock out.” He backed into the airlock and slapped the wall panel to start the cycle.

“We made it,” Basia said. He felt a brief moment of euphoria, followed by a sudden release of pants-shitting terror he hadn’t even known he’d been repressing. If he’d been standing in gravity, he would have collapsed. Naomi and Havelock began stripping off their EVA packs while the airlock ran through the pressurization cycle. Basia fumbled at the straps of his own, but his hands were shaking so badly he couldn’t manage it. After a few moments, Naomi helped him pull it off.

The pack drifted across the compartment and hit the bulkhead with a dull thud. Basia had just enough time to realize he’d actually heard something other than his own breathing when the inner airlock door slid open. Alex floated, framed by the airlock entrance, a goofy grin on his broad dark face.

“XO,” he said, “good to have you back on the ship.”

Naomi pulled her helmet off and tossed it to him. “Good to be back, Mister Kamal.”

There was a short pause while they grinned at each other, then Naomi pushed off toward him and Alex grabbed her in a hug.

“They treat you okay?” Alex asked.

“Kept me locked in a kennel like a dog,” Naomi replied, jerking her head toward Havelock. The squat Earthman had removed his own helmet, and it floated in the air next to him. He was wearing a sheepish half smile. Without his helmet on, Basia saw his short, light-colored hair, a square jaw, and dark eyes. A sort of generic rugged handsomeness. Like a video star

playing a cop in an action movie. It made Basia want to dislike him.

“It was policy,” Havelock said. “I’m—I was chief of ship security on the *Edward Israel*. I think I may have just resigned that position. I was the one that took your XO captive. I hope you won’t hold that against me.”

“Okay,” Alex said, then turned back to Naomi as if Havelock weren’t even there. “What now?”

“Status report,” Naomi replied. “What’s the latest on the degrading orbit?”

“*Barbapiccola*’s going down first, then the *Israel*, then we get to pick between dying in orbit when the batties run out, burning in the atmosphere, or getting shot by aliens,” Alex said with a humorless laugh. “We’re all fucked six ways from Sunday. But it’s nice to have you back on board.”

Chapter Forty-Four: Holden

Holden shuffled his way around the tower again.

He tried to calculate how many hours he'd gone without sleep, but his brain had lost the ability to do math, and Ilus' thirty-hour day kept screwing up his estimates. A long time was all he could come up with.

He triggered his armor's medical system to shoot him up with more amphetamines, and was troubled when the HUD told him the supply was empty. How much did that mean he'd taken? Like the question of how long it had been since he slept, it was an insoluble mystery.

A pair of death-slugs were climbing the side of the tower toward a teardrop-shaped window. The plastic that had been stretched across the opening had a few small rips in it, so Holden knocked the slugs off the wall with his shovel and then kicked them away. He rinsed the toxic slime off his boot in a muddy puddle.

The rain had lessened to a drizzle, which was good, but the temperature had continued to drop, which was bad. While the overall light level didn't change much with the constant cloud cover, Holden had started noticing the day-to-night transition by the appearance of frost on the walls of the tower. It wasn't dangerously cold yet, but it would get worse. Pretty soon the survivors would be adding hypothermia to their list of unpleasant ways to die.

He bit his tongue until it bled and continued his slow trudge around the tower.

He heard Murtry before he saw him. A quiet, ghostly voice drifting out of the gray rain that gradually resolved into a man-shaped spot slightly darker than the space around it.

“—immediate action. They’ve escalated. We’ll have an argument that we acted with restraint until—” Murtry was saying, but stopped when he heard Holden approaching.

“What are you doing out here?” Holden asked. Murtry was still blind. It was dangerous for him to be wandering around outside. The ground, where it wasn’t puddles, was a slick clay that could take someone off their feet in a heartbeat. And the numbers of slugs driven to the surface by the water had Holden wondering if Ilus was a hollow ball filled with poisonous worms.

“Minding my business, Captain,” Murtry said, not quite looking in Holden’s direction.

“Meaning I should do the same?”

“Glad you followed that.”

The two men stood for a long moment. Far above them, their crews were probably shooting at each other right now. They were enemies, and they weren’t. Some part of Holden’s sleep-deprived, half-broken mind still wanted to make peace with Murtry and the RCE. Or at least didn’t want the man’s death on his conscience.

“It’s dangerous out here,” Holden said, keeping his own voice even and calm.

“That makes it different how?” Again, the clenched jaw cutting off the last word with a snap. His anger gave Holden a thin sliver of hope. Maybe Naomi had gotten out. He needed to talk to Alex.

“I can’t let you get killed on my watch,” Holden said.

“I appreciate your concern.”

It all felt vaguely ridiculous, tap-dancing around the issue. They both knew what was happening. He felt like they were playing poker and only pretending they couldn’t see each other’s hand.

“Can I help you back inside?” Holden asked.

“I have some business to finish up here,” Murtry replied with a meaningless smile.

“When we find your corpse later, I’m going to tell everyone I warned you.”

“If I die,” Murtry said, his smile becoming a shade more genuine, “I’ll try to leave a note saying it wasn’t your fault.”

He signaled the end of the conversation by turning away and mumbling into his hand terminal. Holden left him and immediately called Alex.

“Kind of busy here, Cap,” the pilot said without preamble.

“Tell me we’re busy because you’ve rescued Naomi and everything is going perfectly. Is she on the ship?”

There was a long pause as Alex noisily exhaled into the microphone. “So, that part where I went to rescue Naomi? Yeah. I sent Basia.”

Holden spun on his heel to look back at Murtry. The RCE security chief was still talking on his hand terminal. “We sent the prisoner to rescue another prisoner? If that hasn’t already worked, I think I may be watching Murtry order their executions right now.”

“No no,” Alex said in a rush. “It did kind of go to shit, but the radio chatter I’m gettin’ makes me think Naomi’s fine. In fact, I think she might be escaping on her own and savin’ Basia.”

Holden couldn’t help but laugh. Murtry’s head swiveled, looking for the source of the laughter with blind eyes. “Sounds about right. Where are they now?”

“It’s a little confusin’, actually,” Alex said. “I’ve definitely got Basia’s IFF pinging away outside the *Israel*. But there’re a bunch of other suits out there. So it’s complicated.”

“Can you, you know, ask?”

“Yeah, no. Basia switched channels on me without leavin’ the old channel open. Not a guy who’s done a lot of tactical comm drills, I’m guessing. I’m hoping one of them starts talking to me so I can get the new frequencies.”

Holden watched Murtry, probably using his radio to coordinate the pursuit of Naomi and whoever else she was with now. He fought down a sudden urge to walk over to the man, knock him to the ground, take his terminal, and demand to know what the hell was going on.

And then he stopped fighting.

Murtry had just started to turn toward him, frowning at the sound of his approaching steps, when Holden yanked the terminal out of his hand and shoved him to the muddy ground.

“Stay down there or I’ll beat you unconscious,” he told the RCE man. Holding the terminal to his ear he said, “Who’s on the other end of this?”

“Who the fuck is *this*? Where’s Murtry?”

“I’m standing on him right now,” Holden said. “So if you’re part of the team that’s chasing Naomi Nagata, you should stop.”

The man on the other end said, "Comms is compromised, switch to two-alpha," and the connection dropped. Someone who'd spent some time training on tactical comms, it seemed.

"Alex," Holden said. "I've disrupted their command channel. Go get our people."

"Not a problem, boss. The situation has clarified some. I've got three comin' aboard."

"Who's the third?"

"About to go find out. Alex out."

Murtry pushed himself to his knees with a grunt, frowning at a spot just over Holden's left shoulder. "Tough guy when your opponent is blind."

"We're working on fixing that," Holden replied, tossing the man's hand terminal to the ground next to him. "You feel free to come look me up after."

"I will," Murtry said. The RCE security chief picked himself up and began carefully walking toward the alien tower's entrance.

When he was far enough away he wouldn't hear, Holden said, "Looking forward to it." He was surprised to find that was true. When Murtry disappeared around the corner of the tower, Holden began his slow trudge the other direction.

His earbud crackled to life and Amos said, "Cap? That doctor is looking for you."

"Lucia or Elvi?"

"The cute one."

"Lucia or Elvi?"

"The one not married to our prisoner."

"Tell Elvi I'll be there after this pass around the tower," Holden said and killed the connection.

A few minutes later he rounded the last corner, bringing the tower entrance into sight. Elvi was waiting for him there, her face set in a deep frown.

"It didn't work," Holden said.

"What?"

"The oncocidals. My medicine. It's not working."

"What?" Elvi replied, "Why do you say that? What happened?"

"You're frowning."

“Oh. No. I was just thinking that the membrane-bound proteins in our cells must have some sort of functional sites in common with the local life, even though as far as I can tell, they’re totally different proteins. The oncocidals are having a similar effect on mitotic division even though our amino acid groups barely overlap. It’ll take decades to figure that one out.”

“So let’s pretend I have no idea what you’re talking about,” Holden said.

“It’s working,” Elvi said, and her frown shifted into a brilliant smile. “The microorganism’s cell replication is failing. The colonies are breaking down and the light-scattering effect is going too. I can almost read again, if the font’s big enough.”

Holden felt a rush of relief that immediately turned into a wave of dizziness. He collapsed against the wall of the tower, taking long slow breaths to keep from passing out. A few meters away, a slug crawled along the wall toward him. He started to poke it off the wall with his shovel, then realized he’d lost it somewhere and he couldn’t feel his hands.

“Are you okay?” Elvi asked, reaching out tentatively with one hand to find him. “Your respiration sounds funny.”

“Passing out,” Holden said between long breaths. “How long until everyone can see again?”

“We need to get you inside,” Elvi replied, throwing his left arm around her shoulders and guiding him to the door. “I think you’ve been awake for something like four days.”

“It’s okay,” Holden said. “I took a *lot* of speed. How long?”

Elvi stopped, throwing her other arm around his waist to hold him up. It was both a relief and, if he were being honest, a little unflattering how quickly every bit of sexual tension had been drained from their interactions. He was giddy and sleep-deprived enough he almost asked her what had changed. Fortunately, she spoke first.

“Not sure. The dead organism isn’t refracting light like the live ones do. Most of the loss of vision came from that, not from actual blockages. We’ll still have some floaties in our eyes for a while, but...”

“So, that means soon?”

Elvi got him in the doorway and over to a pile of blankets. She gently lowered him until he was lying flat on his back. “Yes, soon I should think. Hours, maybe. Days at the most.”

“How did you know these blankets were here?”

“We laid this out as a sleeping location for you three days ago,” Elvi said with a smile and patted his cheek. “You were just too stubborn to use it.”

“Thank you.”

“We have a small privacy tent too,” she replied, pulling on something by his feet. A thin sleeve of material sprang up and along the length of his body, completely covering him.

“Thank you,” Holden said again, his eyes closing against his will. He could already feel the impending sleep as a tingling in his extremities. “Wake me up in about a year. Oh, and make sure Murtry doesn’t kill me until then.”

“Why would he do that?” Elvi asked.

“We’re kind of at war,” Holden said. Unconsciousness washed into him, sleep pulling him down into the endless void.

“So,” a voice said right next to his ear, “we really need to get a move on.”

“Miller,” Holden said, not opening his eyes, “if you make me get up, I swear I will find a way to murder you.”

“You did your bit here,” Miller continued, undeterred. “Now you need to come with me and do the other thing. And I’m not sure how much time we’ve got. So, upsy daisy.”

Holden forced his eyes open and looked to his side. Miller was inside the tent with him, but also too large to be in the tent with him. The overlapping images sent a spike of pain through his head so he closed them again. “Where are we going?”

“Got a train to catch. Find the back room with the weird pillar in the middle. You guys are using the space for storage. I’ll meet you there.”

“I hate you so, so much,” Holden said, but there was no reply. He risked opening one eye, and saw Miller was gone. When he opened the tent, Elvi was sitting next to it looking worried.

“Who were you talking to?”

“Ghost of Christmas past,” Holden said, forcing himself to sit up. “Where’s Amos?”

“He’s been spending a lot of time with Wei. I think they’re both in the next room.”

“Help me up,” Holden said, holding out one arm. Elvi climbed to her

feet and pulled on it, and he somehow managed to stand without falling over. "My heart is racing. It's not supposed to do that."

"You're full of fatigue toxins and amphetamines. I'm not surprised you're having hallucinations."

"My hallucinations are of the alien mind control variety," Holden said, and took a few unsteady steps toward the next room.

"Can you hear what you're saying?" Elvi asked, coming with him and keeping one hand under his elbow. "You're really starting to worry me."

Holden turned, straightened up, and took one long breath. Then he removed Elvi's hand from his arm and said in as steady a voice as he could manage, "I need to go somewhere and turn off the defense network so our friends don't fall out of space and die. I need you to go back to work on the sight problem. Thank you for your help."

Elvi looked unconvinced, but Holden waited her out and she eventually headed off toward the area of the tower given over to lab work.

In the next room, Amos and Wei were sitting next to a low plastic table, eating ration bars and drinking distilled water out of an old whiskey bottle.

"Got a minute?" Holden asked him, and when Amos nodded he added, "Alone?"

Wei said nothing, but hopped to her feet and left the room, hands in the air in front of her to keep from running into a wall.

"What's the word, Cap?" Amos asked. He took another bite of the protein bar and grimaced. It smelled like oil and paper.

"We got Naomi back," Holden said in a whisper, not sure how far away Wei might have gone. "She's on the *Roci*."

"Yeah, I heard," Amos said with a grin. "Chandra was telling me."

"Chandra?"

"Wei," Amos said. "She's working for the wrong people, but she's all right."

"Okay. Murtry's pissed about the rescue."

"Yeah, but fuck him."

"I also," Holden continued, "may have shoved him down and stolen his hand terminal."

"Stop making me fall in love with you, Cap, we both know it can't go anywhere."

"The point," Holden said, "is that he might try to take it out on people

here. I need you looking after everyone. Especially Lucia and Elvi. They've been the two most helpful to us, so he may try to punish us through them."

"Not so afraid of the blind guy," Amos said. "Even when I'm one too."

"That's about to end. Elvi says the drugs are working. People will be getting their sight back in hours or days."

"Cap, is this a problem you'd like me to *solve*?" Amos asked, cocking thumb and forefinger like a gun. "Because that can just happen."

"No. No escalations. I already did enough damage knocking Murtry around. I'll pay for that when the time comes, but you only do what you have to in order to protect these people when I'm gone."

"Okay," Amos said. "You got it. And what do you mean, when you're gone?"

Holden sat down on the plastic table with a thump and rubbed at eyes that were as dry as steel bearings. The planet was one big ball of humidity, yet he somehow managed to have dry itchy eyes. "I have to go with Miller. He says there's a thing that might turn off the alien artifacts, which would get the *Roci* flying again and pretty much solve all of our problems."

Amos frowned. Holden could see the big mechanic's face twitching as he formulated questions and then abandoned them without speaking. Finally he just said, "Okay. I'll keep an eye out here."

"Be here when I get back, big man," Holden said and clapped Amos on the shoulder.

"Last man standing," Amos replied with another grin. "It's in my job description."

It took Holden a few minutes to find the storage room with the oddly shaped pillar in the middle, but when he did the only person in it was Miller. The detective frowned out a what-took-you-so-long look and Holden flipped him off.

Miller turned away and walked toward the pillar, disappearing into it like a ghost walking through a wall. A few seconds later, the pillar split down the middle without a sound and opened up into a steep ramp heading down into darkness.

"Was this always here?" Holden asked. "Because if it was, and you'd told us about it, it might have saved a few lives when the storm came."

"If you'd been where I could talk to you, I might have," Miller said with a Belter shrug of the hands. "You did pretty well without me. Now get

down the ramp. We're late as it is."

The ramp dropped nearly fifty meters into the ground and ended at a metallic wall. Miller touched it and the wall, in spite of having no visible seams or joints, irised open.

"All aboard," Miller said. "This is our ride."

Holden crouched to enter through the small round opening, and found himself in a metallic cube two meters to a side. He sat on the floor, then slid down the wall until he was lying on his back.

"This is a part of the old material transfer system," Miller was saying, but Holden was already asleep.

Interlude: The Investigator

—it reaches out it reaches out it reaches out it reaches out—

One hundred and thirteen times a second, it reaches out, and the investigator reaches with it. Follows. Watches. It reaches for a signal it will never find. It is not frustrated, it is not angry. It reaches out because it reaches out. What it finds, it uses to reach out, and so finds more, and reaches farther. It will never be far enough. It is unaware of this fact.

The investigator knows, and knows that it knows. An awareness in an unaware context. Consciousness within an unconscious system. So, nothing particularly new there. The investigator sighs, wishes it had a beer, knows that these are artifacts of the template. Once there was a seed crystal that had a name. It had loved and despaired. It had fought and failed and won at great sacrifice. None of that mattered. It had looked for things that were missing. For people that were missing. Everything about it is drawn along by that fact. Something is supposed to be here, and isn't.

And instead, there is a dead place. A place where nothing is. Where everything pulls back. The investigator reaches out, and what reaches out dies. The investigator ceases to reach out. It waits. It considers.

Something was here once. Something built all this, and left its meal half eaten on the table. The designers and engineers that spanned a thousand worlds had lived here and died here and left behind the everyday wonders like bones in the desert. The investigator knows this. The world is a crime scene, and the one thing that stands out—the one thing that doesn't belong—is the place that nothing goes. It's an artifact in a world of artifacts, but it doesn't fit. What would they put in a place they couldn't reach? Is it a prison, a treasure chest, a question that isn't supposed to be asked?

A bullet. A bomb still ticking under the kitchen table after the blitz was

over.

Did He who made the lamb make thee? Or was there someone else? Whoever killed you fuckers left something behind. Something made for your death, and it's right there.

One hundred thirteen times a second, it reaches out, unaware of the investigator, unaware of the scars and artifacts, the echoes of the dead, the consciousness bound within it. It reaches out because it reaches out. It knows that people are dying in some more physical place, but it is not aware that it knows. It knows that it is constructed from the death of thousands, but it is not aware that it knows. The investigator knows and is aware that it knows.

The investigator reaches out, but not at random. It looks for a path, and doesn't find one. It looks for a path, and doesn't find one. It looks for a path and finds one. Not there, not quite, but close. Two points define a line. One point is alive, and one point is death. Neither came from here. Bang those rocks together and see what sparks. See what burns.

The investigator is the tool for finding what is missing, and so it exists. All the rest is artifact. The craving for beer. The hat. The memory, and the humor, and the weird half-fondness half-contempt for something named James Holden. The love for a woman who is dead. The longing for a home that will never be. Extraneous. Meaningless.

The investigator reaches out, finds Holden. It smiles. There was a man once, and his name was Miller. And he found things, but he doesn't anymore. He saved people if he could. He avenged them if he couldn't. He sacrificed when he had to. He found the things that were missing. He knew who'd done it, and he did the obvious things because they were obvious. The investigator had grown through his bones, repopulated his eyes with new and unfamiliar life, taken his shape.

It found the murder weapon. It knew what happened, at least in broad strokes. The fine work was for the prosecutors anyway, assuming it went to trial. But it wouldn't. There were other things the tool was good for. The investigator knew how to kill when it needed to.

More than that, it knew how to die.

Chapter Forty-Five: Havelock

Havelock still wasn't convinced that Naomi Nagata was the best engineer in the system, but after watching her work, he had to concede there probably wasn't a better one. If some of the people on the *Israel* had more degrees or specialties in which they outpaced her, Naomi could make it up in sheer, bloody-minded wildness.

Okay, we can't wait any longer," she said to the muscle-bound bald man on the screen. "If he shows back up, tell him where we stand up here."

"Pretty sure the cap'n trusts your judgment," Amos said. "But yeah. I'll tell him. Anything else I should pass on?"

"Tell him he's got about a billion messages from Fred and Avasarala." Alex's voice came across the comm and also through the hatchway to the cockpit. "They're talkin' about building a mass driver, sending us relief supplies."

"Yeah?" Amos said. "How long's that gonna take?"

"About seven months," Naomi said. "But at the outside, we'll only have been dead for three of them."

Amos grinned. "Well, you kids don't have too much fun without me."

"No danger," Naomi said and broke the connection.

"Are you sure this is a good idea?" Havelock asked.

"Nope," Naomi replied. She pulled herself closer to the command console. "How's it going out there, Basia?"

The comm channel clicked and the Belter's voice hissed into the operations deck. The sound reverberated without giving any sense of spaciousness. A whisper in a coffin. "We're getting close out here. This is a lot of ugly."

“Good thing we’ve got a great welder,” she said. “Keep me in the loop.”

The screens on the ops deck showed the operation in all its stages: what they’d managed so far, what they still hoped. And the countdown timer that marked the hours that remained before the *Barbapiccola* started to scrape against Ilus’ exosphere and changed from a fast-moving complex of ceramic and metal into a firework.

Not days. Hours.

The tether itself looked like two webs connected by a single, hair-thin strand. All along the belly of the *Rocinante*, a dozen ceramic-and-steel foot supports made for a broad base, the black lines meeting at a hard ceramic juncture a few hundred meters out. The *Barbapiccola* underneath them almost had all of the answering structures in place. Once the Belter had the foot supports installed there too, it would be time for the Martian corvette to use its battery power to tug the Belter ship into a more stable orbit, along with its cargo of lithium ore. The complexity of the situation made Havelock a little lightheaded. As he watched, the display showing the surface of the *Barbapiccola* stuttered, and one of the red-flagged foot supports changed to green.

“Okay,” Naomi said over the open channel. “We’re reading solid on that one. Let’s move on.”

“Yeah, give me one more minute here,” Basia’s compressed voice said. “There’s a seam here I don’t like. I’m just going to...” The words trailed off. The readout stuttered red and then green again. “Okay. That’s got it. Moving on.”

“Be careful,” Alex broke in. “Keep the torch cold when you’re moving. These lines’ve got great tensile strength, but they’re crap for heat resistance.”

“Done this before,” Basia said.

“Partner,” Alex said. “I don’t think anyone’s done *this* before.”

The tether lines were standard filament design, built for retrieving dropped Martian marines. Using them to haul a full-sized spaceship was like using a thread to pull a bowling ball: possible with enough patience and skill, and easy as hell to get wrong. Naomi had spent three long hours strapped into her crash couch before she’d decided it was plausible, and even then, Havelock half thought she’d talked herself into believing it because she knew that nothing else was.

Havelock had spent the time having his connections to Murtry's terminal refused and reflecting on the fact that he'd just spectacularly quit his job. It was odd that it weighed on him as much as it did. He was eighteen months from home and probably days at the most from death, and his mind kept turning back to the uneasy surprise with himself that came from walking out on a contract. He'd never done that before. And, since he'd gone with Naomi, he wasn't even sure what his legal status was. Somewhere, he guessed, between former employee and accomplice to criminal conspiracy. It was a wider range than he knew what to do with. If he was really the face of what was happening on New Terra back home, they were all going to be at least as confused as he was.

The truth was that none of the standards of corporate law or governmental authority seemed to apply out here. He could follow the feeds, read the letters, even exchange recorded video with RCE's home office, but those were only words and pictures. The models based on experience in human space—even in the attenuated civilization of the Belt—failed here.

Mostly what he felt, though, was relief. He was very aware of how inappropriate it was, given the context, but he couldn't deny it. It didn't leave him regretting his choices. Except maybe to have taken the job. All the tragedy and pain of Ilus would have been merely sad and distressing to see from a bar on Ceres Station. From where he was, the fear had stopped being an emotion and turned into an environment.

The last foot support indicator went green.

"Okay," Naomi said. "That's looking good from here. What's it like out there, Basia?"

"Ugly as shit, but solid."

"How's your air?"

"I'm all right," the Belter said. "Thought I'd stay here, in case anything breaks that I'd be able to fix."

"No," Naomi said. "If this fails, those lines will snap fast enough to cut you in half. Come back to the barn."

Basia's percussive snort was more eloquent than words, but the small yellow dot began to move from the surface of the *Barbapiccola* up through the vacuum toward the *Rocinante*. Havelock watched, his fingers laced tightly together.

“Alex,” Naomi said, “can you check the release?”

“It’s good,” Alex said, his voice coming from the cockpit and the radio link both. “We start going pear-shaped, we can let go.”

“All right,” Naomi said. And then, softly to herself, “All right.”

“If this doesn’t work,” Alex said though the deck hatch between ops and the cockpit, “our man Basia’s going to watch his baby girl burn to death. I sort of promised him that wouldn’t happen.”

“I know,” Naomi said. Havelock had hoped she’d say, *She won’t*.

It took Basia eighteen minutes to get back to the *Roci* and another five to negotiate the airlock. Naomi spent most of that time on the radio to the captain and engineer of the *Barbapiccola*. Half the conversation was in Belter patois—*ji-ral sabe sa* and *richtig ane-nobu*—that might as well have been in code for all he could follow it. Havelock requested a connection to Murtry’s hand terminal and was refused again. He wondered whether he should write some sort of press release or letter of resignation to the company.

“All right,” Basia said, sloping up into the ops deck. His face still had the thin, watery layer of sweat adhering to it. “I’m here.”

The readout counting down to the *Barbapiccola*’s atmospheric impact was down under an hour. It was hard for Havelock to remember that the stillness of the deck was an illusion. The velocities and forces involved in anything at orbital altitudes were enough to kill a human with just the rounding error. At their speeds, the friction from air too thin to breathe would set them on fire.

“Strap in,” Naomi said, nodding to the crash couches. Then, to the radio, “*Rocinante* bei here. Dangsineun junbiga?”

“Ready con son immer, sa sa?”

Naomi smiled. “Counting down,” she said. “Ten. Nine. Eight...”

At four, the displays on the consoles began to shift color, mapping the two ships, the tether lines, the engines in psychedelic false color. Basia was muttering under his breath, and it sounded like prayer. Naomi reached *one*.

The *Rocinante* moaned. The sound was deep as a gong, but it didn’t fade like one. Instead the overtones seemed to grow, one layering over another. On the displays, the tethers shimmered, the internal forces racing along the spider-web lines in crimson and orange and silver.

“Come on, baby,” Naomi said, petting the console before her. “You can

do this. You can do it.”

“Getting pretty close to tolerance up here,” Alex said.

“I see it. Keep it gentle and steady.”

The *Rocinante* shrieked, a high scraping scream like metal being ripped apart. Havelock grabbed the sides of his crash couch, squeezing until his hands ached.

“Alex?” Naomi said.

“Just passing through a resonance window. Nothing to worry about.”

“I’m trusting you here,” Naomi said.

“Always can,” Alex said, and Havelock could hear the grin he couldn’t see. “I’m the pilot.”

Basia gasped. Havelock turned, but it took a few seconds to see what the Belter was reacting to. The countdown timer—the death timer—had changed. The *Barbapiccola* was slated to burn in three hours and fifteen minutes. Four hours and forty-three minutes. Six hours and six minutes. It was working. As Havelock watched, the life span of everyone on the ship below him ballooned out. Havelock felt like shouting. It was working. It had no right at all to have worked, and it was working.

The alarm Klaxon cut through the other noise. Naomi snapped back to her console.

“What am I lookin’ at, XO?” Alex said. The sound of the grin was gone. “Why am I seeing a bogie?”

“Checking it out,” Naomi shouted, not bothering with the radio. Havelock turned his own console to the sensor arrays. The new dot was approaching from the horizon, speeding above them in its own arc above cloud-choked Ilus.

“Where’s the *Israel*?” Havelock shouted.

“Occluded,” Naomi said. “We should be passing each other in an hour. Is that—”

“That’s the shuttle.”

The death timer showed seventeen hours and ten minutes.

“The shuttle you turned into a fucking torpedo?” Basia asked. His voice was surprisingly calm.

“Yeah,” Havelock said. “But the payload was the reactor overload, and there aren’t any reactors working, so—”

“It’s running on battery, then. That’s still going to be a hell of a lot of

kinetic energy,” Naomi said.

“Is it going to hit us?” Havelock asked, and felt stupid as soon as the words were out of his mouth. Of course it was going to hit them.

“Alex?” Naomi said. “Give me options here.”

“PDCs are online, XO,” Alex said. “All I’ve got to do is put a little battery power to ’em, set ’em to automatic, and point defense can slag that thing before it comes close.”

Twenty hours and eighteen minutes.

“Power to the PDCs,” Naomi said. “Watch the tethers.”

“Sorry,” Alex said. “Just trying to do a few too many things at once here. Powering up the PDCs.”

That won’t work, Havelock thought. *We’re forgetting something.*

The red dot drew closer. The *Israel* itself hauled up over the edge of the horizon, visual contact still blocked by the curve of the atmosphere. The shuttle sped toward them. The firing of the point defense cannons was hardly more than a brief vibration in the overwhelming strain of dragging up the *Barbapiccola*. If he hadn’t known to expect it, he’d have missed it entirely. The red dot blinked out, and then back in.

“Oh,” Alex said. “Huh.”

“Alex?” Naomi shouted. “What’s going on? Why aren’t we shooting it?”

“Oh, we shot the hell out of it,” Alex said. “Busted that shit right on up. But this right now is when I’d normally be dodging out the debris path? That’s not really an option.”

“I don’t understand,” Havelock said. And then he did. The shuttle had been a great big hunk of metal when the point defense cannons hit it. Now it was almost certainly a great number of relatively small pieces of metal with pretty close to the same mass moving at very nearly the same speed. They just traded being hit with a shuttle-sized slug for being hit with a shuttle’s mass of shrapnel.

Naomi pressed her hand to her lips. “How long before—”

The ship shuddered. For a second, Havelock thought it was the PDCs kicking in again. Something was hissing and his crash couch had a sharp edge that he didn’t remember. The death clock had gone black. A growing mass of blood around his elbow was the first concrete sign he had that he’d been hurt, but as soon as he saw it, the pain detonated.

“Ops is holed!” Naomi shouted into the radio.

“Cockpit’s sealed,” Alex said. “I’m good.”

“I’m hurt,” Havelock said, trying to move his bleeding arm. The muscles still functioned. Whatever had hit him—shuttle debris or shrapnel from the crash couch—it hadn’t crippled the limb. The crimson globe inching its way along his arm was getting fairly impressive, though. Someone was tugging at him. Basia, the Belter.

“Get off the couch,” the Belter said. “We’ve got to get off the deck.”

“Yes,” Havelock said. “Of course.”

Naomi was moving through the compartment. Bits of anti-spalling foam swirled in the thinning air like snowflakes.

“Are you gettin’ anything over those holes?” Alex asked, his voice disconcertingly calm.

“I’m counting ten down here,” Naomi said as Havelock hauled himself out of the crash couch and kicked off toward the hatch leading deeper into the ship. “I didn’t bring that many beer coasters. I’m taking the civilians down to the airlock, putting them in suits. Havelock’s hit.”

“Dead?”

“Not dead,” Havelock said.

Naomi finished keying in the override and the deck hatch opened with a little puff of incoming air. Havelock’s ears popped as he pulled himself down into the airlock deck.

“How’s the tether?” Basia asked, following close behind.

“No damage to the main line,” Alex said. “We lost one of the foot supports, but I can try to adjust.”

“Do it,” Naomi said, and grabbed Havelock by the shoulder. The emergency aid station by the airlock door had a roll of elastic bandage and a small wound vacuum. Naomi pulled his arm out straight and pressed that vacuum’s clear plastic nozzle into the center of the globe of blood. “What am I looking at, Alex?”

“Checking, XO. All right. We’ve got a slow leak in the machine shop. The port side’s pretty messed up. Sensor arrays and PDCs on that side. Maneuvering thrusters aren’t responding. They may not even be there. There’s a lot of power conduits right around there too, but with the reactor off-line, I don’t know if they’re hit or not.”

The gouge in Havelock’s arm was as long as his thumb in a sharp V shape. Where the flesh had peeled back, his skin looked fish-belly white.

The margin of the wound was nearly black with pooling blood. Naomi put absorbent bandage on it and started wrapping it down with an wide elastic band. She had tiny dots of his blood in her hair.

“How are we for moving?” she asked.

“I can go anyplace you want, so long as it’s counter-clockwise,” Alex said. “If there were a dock anywhere within a year of here and we had a reactor, I’d have a vote where to go next.”

“We’ll work on a plan B. How’s the *Barb*?”

Basia almost had his welding rig back on. Naomi patted Havelock’s wounded arm, a small physical statement. *You’re good to go*. She turned to the lockers and started pulling out an environment suit of her own.

“She’s still coming up,” Alex said. “But I’m starting to get worried about that missing foot support.”

“All right,” Naomi said. “Back the thrust down for now. We’ll see if we can get it stuck back on.”

Havelock pulled the thick leggings on, shrugged into the suit. He checked the seals automatically, long years of living in vacuum making it all as quick and automatic as reflex. The suit’s medical array kicked on and immediately injected him with a cocktail of anti-shock medicines. His heart raced and his face flushed.

“Well, the good news is they’re out of shuttles,” Basia said. “They won’t be doing that again.”

“What *are* they going to do,” Naomi said. It took Havelock a long moment to realize she was talking to him.

These were his people. Marwick and Murtry. The militia of engineers. The RCE team had launched the shuttle at the *Rocinante* and tried to break up a civilian rescue operation. It was a strangely dislocating thought. He’d spent a countable fraction of his life protecting these people, keeping the shipboard politics that always rose up on a long voyage to a minimum, protecting them from outside threats and internal ones. They’d tried to kill not only him, but the crew of the *Rocinante* and the *Barbapiccola* too. And the worst of it was that he wasn’t actually surprised.

“XO? I think we’ve got a hole in the port torpedo rails too. Might want to see if everything’s still in place down there. Failsafes are pretty good, but we’ll want to check them all if we ever plan to fire one. It’d be a real pity for our own ordnance to blow us up.”

“Roger that,” Naomi said. “I’m on my way. Basia, can you coordinate with Alex and get that foot support back where it’s supposed to be?”

“Sure can,” the Belter said. The one who’d been part of that first conspiracy to have the RCE people killed. Who had Governor Trying’s blood on his hands. For a moment, their eyes met through the doubled windows of their helmets. Basia’s eyes were hard, and then Havelock thought there was something else. A flicker of shame, maybe. Havelock watched as he cycled the airlock open, and then he watched it close.

“Havelock,” Naomi said. “I need you to answer the question.”

“Which question?”

“What are they going to do next?”

He shook his head. His arm throbbed. There was no point to the attack except spite and the kind of violence that passed for meaning in the face of despair. If Murtry was behind it, all he’d care was that the *Barbapiccola* went down before the *Israel*. If it was the engineering militia, they’d done it to show that they hadn’t lost.

The reasons behind it didn’t matter.

“I don’t know,” Havelock said, then sighed. “But it will probably be bad for everyone.”

Chapter Forty-Six: Elvi

Elvi thought her eyesight's return was like coming out of a fog. The green that had enveloped the world was just as vivid at first. It lasted long enough that she was afraid she'd been wrong, or that the long-term use of the oncocidals had made some other change to Holden's physiology that short-term use wasn't having. And then the shadows had lines around them again, little zones of definition. And then within hours, she could see the doorway arch and the shape of the chemistry deck. By the time she'd been able to see clearly enough that she could tell Holden for certain that they'd solved the problem, the man had been in what looked like a sleep-deprivation psychosis. It made her feel a little guilty that she hadn't figured it out earlier. But he'd gone off to talk to Amos, and she was fairly sure that the big man would be able to take care of his captain. And Elvi had too many other things to do.

The chemistry deck's slowed water purification turned out to be a bigger issue than she'd expected. The distillation filters were exhausted; material that had gone in as white, puffy pads of spun glass embedded with ionic scrubbers came out slick and green. But the other people from the science team and the survivors of First Landing were all starting to get function back too. It took almost four hours, but Elvi and Fayeze and two of the mining technicians had rigged a still just outside the ruins that was converting the fallen rainwater to something potable at nearly three gallons an hour. It tasted like fake spearmint flavoring and alfalfa, but it would sustain life.

When Elvi found Lucia, the doctor looked as bad as Holden had sounded. Her skin had an ashy tone and the whites of her eyes were so pink

Elvi was surprised they weren't bleeding. Jacek was following his mother around, carrying her medical scanner and a little sack of bandages. Elvi watched them check on the patients. Everyone was covered in mud and grit. The differences between RCE and squatters were buried under the layers of filth and the shared joy in their returning sight. When Jacek caught her gaze, she smiled. He hesitated, then nodded almost shyly and smiled back.

"Clouds are starting to thin," Lucia said. "I saw a patch that was actually white."

"Really?" Elvi asked.

"Still looked greenish to me, of course, but it was actually white," the doctor said. When she shook her head, it seemed to take her a fraction of a second to start. "You did good work. I've only got three people the treatment's not working on."

"Why isn't it working for them? Maybe we should—"

"This isn't science," Lucia said. "It's medicine. A success rate this high on a new treatment for a novel illness? We're doing brilliantly. None of us are back to baseline yet, though. If it happens at all, it will take time."

"Time," Elvi said. "Strange to think we've got any of that."

"We've traded up from dying in the storm to dying from the slugs to dying of hunger in a few weeks."

"We're pushing the crisis point back. If it's not winning, at least it's a way not to lose."

"If we can keep pushing it back."

But we can't. The words hadn't been said, but they didn't need to be. With the ships fighting each other and falling out of orbit and the native ecology basically inedible, extending the group's horizon past a few weeks of starvation was going to be difficult. Maybe impossible. The stress was showing in the people, RCE and First Landers both. Elvi saw it, the segregation into tribes again now that the immediate danger had passed. She wondered whether it would come back when the food ran out.

"You need rest," Elvi said, and a hand touched her shoulder. Wei and Murtry were behind her. Wei's expression was bleak. Murtry, on the other hand, was smiling his customary smile. Of all of them, the coating of mud on his skin and in his hair looked almost natural. Like he was in his native element.

"Doctor Okoye," Murtry said, "I was hoping we could have a private

word.”

“Of course,” Elvi said. Lucia nodded curtly and turned away. Elvi felt a little pang of disappointment. After all the trials of the storm and the blindness, the political divisions between the RCE and First Landing were still there, just below the surface. Murtry was still the man who’d burned a building full of terrorists. Lucia was still the wife of a man who’d conspired to destroy the heavy shuttle. It seemed like it should have mattered less now, like the rains should have washed something clean. Anything.

“I was wondering what you could tell me about the last conversation you had with Captain Holden,” Murtry said. His voice sounded perfectly calm and reasonable. It was like they were back on the *Israel* and he was asking her to think back to the last time she’d used some tool she couldn’t find.

“Well, he was very, very tired. Exhausted. It seemed to be having some real cognitive effects.”

“Cognitive effects like what, please?” Murtry asked.

“He was babbling,” Elvi said. “Bounding from jokes about mind-controlling aliens to Charles Dickens to insisting that he had some way to shut down the defense network. He was really all over the place. I tried to get him to rest, but—”

“Do I understand you that he intended to disable the alien technology presently functioning on this planet?”

“Yes. I mean, why wouldn’t he?”

“Doesn’t belong to him. Did he say how he intended to accomplish this?”

“He didn’t. But I don’t think there really was anything. It was just his brainstem attaching to his vocal cords. I’m pretty sure he was only half aware that he was talking at all.”

“Did he mention going north?”

Elvi blinked, scowled, shook her head.

Murtry pulled up his hand terminal, tapped it three times, and held it out to her. A rough map of Ilus’ only continent showed on the screen with two dots. One, she knew, was the location of First Landing, or where the place had been, anyway. She assumed it indicated where they were. A second dot was almost an inch and a half away.

“I took the liberty of tracking the captain’s hand terminal signal,”

Murtry said. "Signal's patchy and intermittent, but it seems he's been traveling north at an average of two hundred clicks an hour. I find that very interesting."

Elvi handed the terminal back to him. "He didn't say anything about it. Just that he had something to do. He talked to Amos afterward. I thought that was probably what he meant. Honestly, I'm surprised he can even drive a cart."

"He isn't driving a cart," Murtry said. "We've only got two carts, they're both right outside, and one of them doesn't even have a power cell."

"I don't understand," Elvi said. "Then how is he..."

"Going two hundred kilometers an hour?" Murtry said. "That would be one of many, many questions I'd like to have answered. Thank you for your time, Doctor."

Murtry nodded, turned, and walked toward the archway that led outside. Elvi watched him go, scowling. Had Holden said anything else? She couldn't think of anything. But maybe he'd said something to Amos.

She found the big man standing in the mud outside the work tent where the carts were parked, arms folded across his bare, mud-streaked chest. He had a nasty scar across his belly and a tattoo of a woman over his heart. She wanted to ask about them both, but didn't. The one working cart was rolling out, Murtry and Wei at the controls. The big silica-gel wheels made wet smacking sounds in the mud, but the cart picked up speed quickly, bouncing along the ruined landscape in the soft rain.

"Was there a drop?" Elvi asked.

"Nope," Amos said.

"Is there going to be a drop?"

"If there is, they'd better get it in walking range. Unless I can get another fuel cell up, that right there was our one working set of wheels."

"Oh," she said. And then, "Did Holden say anything to you before he, ah, left?"

"Yep," Amos said, still scowling after the cart.

"Was it about going north?"

"Not in particular, but I knew he was going someplace in case he could get Miller to turn the fusion reactors back on for us."

"Miller?" Elvi said with a shake of her head.

"Yeah, that's a long story. Pretty much all the cap had for me was to

make sure that one”—Amos nodded at the retreating cart—“didn’t get uppity and start killing folks again.”

“He’s going after Holden.”

“Hmm. Don’t know if that makes my job harder or easier.”

The big man shrugged and walked into the repair tent. The remains of half a dozen fuel cells were laid out on a thin plastic tarp. Amos squatted beside them, then started arranging the cells by size and the extent of their obvious damage.

“This’d be a lot easier if the *Roci* could just drop me down a fresh cell,” he said.

“You’re going after Holden too?”

“Well, the way I figure it, I’m supposed to make sure Murtry doesn’t hurt anyone. He ain’t here, so all these folks are looking pretty safe. Might as well go where he is, make sure he don’t hurt no one there either.”

Elvi nodded and looked north. The cart was a small dot near the horizon throwing up a plume of spattered mud. She couldn’t judge how quickly they were going, but she was sure they’d be beyond the horizon soon.

“If you get that working, can I come too?”

“Nope.”

“Seriously, let me come with you,” Elvi said, kneeling beside him. “You’ll need backup out there. If anything goes wrong. What if you go blind again? Or if something stings you? I know the ecology out here better than anyone. I can help.”

Amos picked up a fuel cell, squeezing the casing until the metal bowed out a degree, and slid the internal cell out into his hand. A slurry of green-yellow mud came with it.

“Holden was talking about aliens. Like living, thinking, communicating, mind-controlling aliens,” Elvi said. “If that’s true, I could talk with them. *Document* them.”

Amos wiped the mud from the cell with his palm and squinted at it, sighing. He put it down and picked up the next one.

“We’re going to die here,” Elvi said, her voice soft, gentle, pleading. “The food’s going to run out. You go out there, and you’ll be passing through a whole biosphere no one’s ever seen before. There are going to be things you and I haven’t even imagined. I want to see those before I die.”

The next cell opened. There was no mud, but the acrid stink of melted

plastic filled the air, stinging her nose and eyes. Amos closed it again.

“You need to get electricity to drive that cart,” she said. “If I tell you how to do that, will you take me with you?”

Amos turned his head to her, his gaze fastening on her like he was noticing her for the first time. His smile came slowly.

“You got something you want to tell me, doc?”

Elvi shrugged. “The alien moon defense grid thing shot down the shuttle with the fusion drive and the drop with batteries and fuel cells in it, but it let the food and medicine come through. It also isn’t busy shooting the clouds, even though there are a bunch of organisms living in them that are made of complex organic compounds. It doesn’t care about chemical energy inside compounds. You could have the *Rocinante* drop you a chemical fuel source. Acetylene, maybe. You’ve got acetylene tanks up there, don’t you?”

“Hell, I got acetylene right here. But these here don’t run on fire,” Amos said.

“They don’t have to,” Elvi said. “The chemistry deck has a combustion chamber that runs assays by converting exothermic reactions into current and then measuring the output. It’s not much of a chamber, but if you take that out and build a decent-sized combustion chamber—maybe a ten-centimeter surface—you could probably capture enough of the chemical energy from the burn to make the same current coming out of one of those things. We might need to build a transformer to get the amps and volts just right, but that’s not actually hard.”

Amos scratched his neck and rocked back on his heels. His eyes were narrow.

“You just come up with that on the spot?”

Elvi shrugged. “Does that mean I can come with you?”

Amos turned his head and spat on the ground. “Sure,” he said.

“I just want to know why,” Fayez said.

“Why what?” Elvi asked, walking through the main chamber of the ruins. She had two thick plastic sacks of fresh-ish water. Potable, at least. And a box the size of her hand with protein rations in it. It was supposed to be enough for one person for one day, and it was all they were going to

have until they came back to the camp in the ruins. She'd also found a satchel with a wide fake-leather belt to strap it closed.

"Why you're chasing after Holden again," Fayez said, ducking around a passing woman.

"I'm not chasing after Holden," Elvi said, then stopped and turned, putting her palm against Fayez's chest. She could feel his heartbeat against her fingertips. "You know I'm not chasing after Holden, don't you? Because that's... I mean, *no*."

"Then why?" he said.

The organisms still dying in Elvi's eyes had lost all their green tinge, but they left the world a little blurry. She felt like she was seeing Fayez through a filter that softened his features, smoothed his skin. He looked like a media star in some particularly unflattering role that involved a lot of mud and not many showers.

"Because I want to *see*," she said. "It's why I came out here. It's why I've been spending all my time taking samples and running assays. I love what I do, and what I do is go look at things. Holden said he was talking to aliens, and that he might be able to turn off the defense grid, and it means we're going to drive through the wilderness—"

"What's left of it," Fayez said.

"And because I'm going to die," Elvi said.

Fayez looked away.

"We're all going to die," Elvi said. "And we're all very probably going to die very, very soon. And my choices are to go out and look at this amazing, strange, beautiful, ruined world or else stay in the camp and watch everyone around me die by centimeters. And I'm a coward and a hedonist and I'm sometimes very, very selfish."

"You know. Between the two of us, I always thought of myself as more along those lines."

"I know."

Outside, Amos' kludged cart was roaring, the constant burn of the combustion chamber was like a synthesizer stuck on a particularly ragged and unpleasant G under middle C. Amos was in the cab, sitting at the controls. Fayez walked with her to the side of the cart and then helped her scramble up into the cab. When he stepped back, he had his hands shoved deep in his pockets. She couldn't see quite well enough to know if there

were tears in his eyes too.

“Those the supplies, doc?” Amos asked.

“They’re what we’ve got to work with.”

“All right then. I got the signal from the captain’s hand terminal locked in. We got maybe a week’s worth of gas, and the guy I’m after’s got a day’s head start.”

“I wish we had sunglasses,” she said. “Or a pizza.”

“Fallen fucking world, doc.”

“Let’s go.”

The cart lurched once, the tires spinning in the mud for a moment, then catching and lurching again. The rain made tiny dots on the windshield, and a wide, smeary wiper cleared them away. The world before her was a vast plain of mud. She checked Amos’ hand terminal. The path toward James Holden would take them through territory that had been forestlike, past the shoulder of a massive freshwater lake, through a maze of canyons that defied any standard geological explanation. She was going to see a world in the aftermath of utter disaster, but she would still see it. And the state of nature was always recovering from the last disaster.

“Stop,” she said. “Could you please stop. Just for a minute?”

“You need a potty break, you should have thought of that before we started,” Amos said, but he stopped the drive. She couldn’t even hear the electrical motors winding down over the roar of the acetylene-powered generator. She opened the door of the cab and leaned out. They’d only gone a hundred meters. She could still see Fayeze, even though he was mostly a dark, fuzzy blot. She waved, and he waved back. She gestured that he should come toward her, and he did. She watched him trot across the mud field, looking down and watchful for slugs.

When he reached the cab, he looked up at her. She was sure there were tears in his eyes now.

“Chances are I’m not coming back,” she said.

“I know.”

“Kind of need to get a move on, doc,” Amos said. “Don’t mean to be a buzz-kill or nothing.”

“I understand,” Elvi said. She looked down again. Her gaze met his dark eyes. “Are you getting up here?”

“Is he what?” Amos asked at the same moment Fayeze said, “Of course I

am.”

Elvi scooted across the seat, making room for him. Fayez climbed up beside her and slammed closed the door. Amos looked at them both, his eyebrow lifted. Elvi smiled at him and pulled Fayez’s arm over her shoulder.

“Don’t remember this was part of the deal, doc,” Amos said.

“It’s kind of like our honeymoon,” Elvi said. She felt Fayez stiffen for a moment, and then almost melt against her.

Amos considered that for a moment, then shrugged. “Whatever floats your boat.”

Chapter Forty-Seven: Basia

How's it look in there?" Naomi said in Basia's helmet. She had a nice voice, a singer's voice. It sounded good even over the tiny suit speakers. Basia recognized that his cognition was drifting and shook his head once, sharply. A glance at his HUD told him his O2 levels were low, and he pulled out a replacement bottle.

I've found the other five holes," he said while he worked at the air intake nipple. "You were right. Two were behind a console. Tough to see from that side. But I think this is all of them in ops."

"Machine shop is next," she replied. "Got one slow leaker there. It's cramped. We've got some after-market equipment using up a lot of the space between hulls."

"I'll squeeze," Basia said, then pulled out a small metal disk and started welding it over one of the five holes.

"She is over the horizon... *now*," Alex said over the channel. Naomi was sitting in her vacuum suit on the ops deck coordinating the work, so the only way anyone could talk to her was on her suit radio. Basia wanted to ask who *she* was, but started welding a second patch instead. A tiny red glob of molten metal spun off the bead and stuck to his faceplate, cooling to a black dot over his left eye. There wasn't much danger of it hurting his suit, but it was a rookie mistake anyway. A sign he was tired. The gentle rotation of the *Rocinante* at the end of the tether made free-floating objects drift toward the walls. He'd need to remember that.

"Didn't leave any presents for us?" Naomi asked, still talking about the mysterious *she*.

"Nope," Alex said. "I keep hitting her with our targeting laser when she

goes by. A warning.”

“The PDCs are totally shut down, and plasma torpedoes don’t work now,” Naomi said.

“Yeah, but *they* don’t know that. Last they saw, I chopped their shuttle into sushi with a PDC burst.”

“Kinda wish we hadn’t done that.”

“Well, do you like one big hole or lots of little ones?”

“Fair point,” Naomi said. “Almost done down there?”

It took Basia a second to realize she’d started talking to him again. “Yeah, last one going up now.”

“I’ll guide you to the machine shop exterior bulkhead.”

Naomi hadn’t been kidding about cramped. There was some kind of large, blocky device taking up almost all of the space between the inner and outer hull. A long metal tube projected from one side of it, and seemed to run the entire length of the ship’s hull like a sewer pipe. On the opposite side of the device, a complex-looking feed mechanism sat. Flanking the central mechanism, and also down almost the entire length of the tube, sat twin rows of powerful-looking industrial batteries.

“Sixty-two percent, XO,” Alex said. “Droppin’ fast. And the clock’s down to about twelve hours for the *Barb*. If I had thrusters that worked, I’d be wantin’ to do a burn about now.”

“I’ve shut down everything I can think to shut down,” Naomi replied. “So our power is what it is. I’m trying to come up with a plan for moving working thrusters to replace broken ones, and wind up with some semblance of maneuverability. But it’s not a trivial problem. We’re pretty beat up.”

Basia played his suit’s light around the space until he found the faintest trace of frozen vapor. It led him to the tiny hole in the machine shop’s bulkhead, and seconds later he was patching it with another metal disk. The actinic blue of his torch threw the space into bright relief, the shadows of conduits and thruster housings dancing madly in the glare.

“Alex?” Basia said as he worked.

“Yo.”

“What is this thing I’m next to? It looks high-powered. Should I avoid getting any hot residue on it?”

“Uh, yeah,” Alex said, then gave a humorless laugh. “Please avoid that.”

“It’s a rail gun,” Naomi said. “We had it added to the ship. You might damage it, but it won’t blow up or anything. It fires solid metal slugs, not explosives.”

“Okay,” Basia replied. “Just about done here.”

“It cost about three hundred thousand Ceres new yen,” Alex said. “So don’t break it, or you bought it.”

By the time Basia had returned through the airlock, stripped off his welding rig and vacuum suit, then put everything away, Naomi had replaced the lost atmosphere on the ops deck and everyone was gathered there. She floated near the command console, still wearing her lightweight atmosphere suit, but with the helmet off. Havelock and Alex were across the deck from her, clinging to the combat operations crash couch. The three of them were floating in the sort of intense silence that only follows a heated conversation.

“There a problem?” Basia asked when the deck hatch had closed behind him.

Alex and Havelock both looked away from him, something like embarrassment on their faces. Naomi did not look away. She said, “We’re going to lose the *Barbapiccola*.”

“What?”

“I have a plan for moving five maneuvering thrusters from the starboard side of the ship to port. This will give us close to sixty percent maneuverability. It’ll be enough to keep us in the sky until the power runs out. But we can’t do it fast enough to tug the *Barb* out of her descent. She’ll start scraping atmo before we’re even halfway done. We have to cut her loose.”

“No,” Basia said.

“We tried,” Naomi continued as though he hadn’t spoken. “But the damage caused by the shuttle was just too serious. I’m going to call the captain of the *Barb* and ask that your daughter be transferred to this ship. The price is there will be a few others that come with her. Just a few, though.”

Basia felt an almost overwhelming sense of relief, followed by an

equally powerful rush of shame. “There are a hundred-some people on the *Barbapiccola*. We just let them all die?”

“Not all of them, but even if we wanted to bring them all here, they wouldn’t fit. A full company on the *Roci* would be twenty-two. Our other choice is to die with them,” Naomi said. Her voice trembled, but her gaze was steady. She knew exactly how awful her words were, but she wasn’t backing away from them. Basia found himself suddenly very afraid of the *Rocinante*’s executive officer. “But we’re not buying ourselves much in the process. With our power failing and running on a little over half thrust, we’re getting very close to the point that we won’t be able to get to a stable orbit where we can die slowly when the environment systems shut down. And, of course, we’ll have moved as many of the *Barb*’s crew as we can to this ship. Which just means we’ll burn through our power that much faster. This is lose, lose, lose, Basia. There aren’t any good choices anymore.”

Basia nodded, accepting her statements without argument. She was the expert. But he felt like there was something missing. It itched at the back of his mind. To distract himself, he traced with his finger in the condensation building up on the nearest wall panel. That shouldn’t be happening. The atmosphere system shouldn’t be allowing humidity to build up like that. But now that he thought about it, he realized that the air did feel thick, and too hot. Naomi, running the environmental systems at minimum power. She wasn’t lying. They’d run to the very edge of their ability to keep themselves in the sky.

“When do they come, and how do they get here?” Havelock asked, talking about refugees from the *Barbapiccola*.

“Three hours. I want you to go down and escort them. I don’t know how good their suits are, but I don’t expect much. We may have to haul some EVA suits of our own down to them.”

“Roger that,” Havelock said with a nod. An Earthman’s nod. Tipping the head back and forth. A move totally invisible in a space suit. Without thinking about it, Basia tipped his fist back and forth to show him how to do it right. Havelock ignored him.

But thinking about something else for a moment broke the logjam in his brain, and the idea he’d been fumbling toward popped fully formed into his head.

“Why don’t we use the batteries for the rail gun?”

“The what?” Havelock said.

“Huh,” Naomi said. “Not a terrible idea. They’re topped off, right?”

“They pull power to keep themselves full when the reactor’s on, and we haven’t fired the gun and they discharge really slow when not in use,” Alex replied. “But they’re on a separate system. No way to pull power the other direction without some work.”

“I can work,” Basia said. “I’ll do it. Tell me what to do. I’ll recharge my suit and the welding rig right now.”

“Wait,” Naomi said. Her face had gone strangely blank, except for her eyes moving rapidly back and forth like she was reading something in the air. “Wait a minute...”

Havelock started to say something, but Alex grabbed his arm and silently shook his head.

“We’ll pull power off the rail gun grid, transfer it over to the main grid, and use it to heat propellant mass for thrust,” she finally said.

“Yep,” Alex agreed.

“With loss at every step. That’s really inefficient.”

“Yep,” Alex repeated.

“When we have propellant mass already in the system without moving the power,” she continued. “Alex, how much acceleration does a two-kilo slug traveling at five thousand meters per second give the ship?”

“Enough,” Alex replied with a sly grin, “that we’re supposed to only fire it with the main drive on.”

“Sounds like a thruster to me,” Naomi said, grinning back at him.

“Uh,” Havelock cut in, “the ship is spinning a little after that shuttle strike and all? Won’t that make it tough to, you know, aim?”

“It’s not a trivial problem,” Naomi admitted. “We’d need to make sure we fire at the exact millisecond the two ships and the cable are aligned. No way a human could judge it. But the *Roci* can if I tell her what we need.”

“Isn’t the *Barb* in the flight path?” Havelock asked.

“Right,” Naomi said, her voice soft and uninflected. “So the sequence will have to be tipping the *Roci* nose down as we spin past the firing point, launching a round, then tipping her back nose up to keep from spinning out of control on that new axis. Fortunately, *those* thrusters work.”

“This sounds,” Basia said, “pretty hard.”

“Well,” Naomi said with a smile and a wink. “It’s only the most

complicated nav program I'll have ever written, but I have a couple hours to do it in."

"I don't know about you folks, but I'm excited to be part of this plan," Alex said. "Let's get going."

Basia watched the clock tick away the hours and minutes to his daughter's death.

Naomi sat at her console rapidly typing. The symbolic language she used to program the *Rocinante*'s navigation systems meant nothing to him. Watching her work was like listening to someone speak in a foreign language: the awareness of information without actual meaning. But he watched her anyway, knowing that she was building a program that might add precious minutes back to the clock. Maybe hours. Not days.

Alex was back up in his cockpit, out of sight. But periodically he called down on the ship's comm to talk to Naomi about her work, so he was apparently following along from his own station. He would ask for clarifications or make suggestions, but his words were as empty of content to Basia as the symbols on Naomi's screen.

Havelock had gone belowdecks to move the emergency escape bubbles out of the cargo hold and up to the main airlock. The rail gun plan might not work, and the next step was to evacuate as many people from the *Barbapiccola* as the *Rocinante* could handle.

It was all just delaying games. Try to save the *Barb* a little longer with their rail gun heroics. If not, save a few people by moving them to the *Roci* before she fell out of the sky or turned into a killing jar with twenty more people breathing her air and overloading her life support.

But they all did it without question. They fought and worked and devised intricate plans to buy more time. Basia had no doubt that they'd work just as hard to keep each other alive for even a few more minutes. It wasn't something he'd ever had to think about before. But it did seem to be a microcosm of everything in life. No one lived forever. But you fought for every minute you could get. Bought a little more with a lot of hard work. It made Basia proud and sad at the same time. Maybe that was how a warrior felt, standing on ground he knew he'd never leave alive. Making the choice

to fight as long and hard as he could. Basia couldn't think why *I went out, but I didn't go out easy* was such an appealing and romantic notion, but it was.

Looking at the angry brown ball of Ilus, rotating past on his screen, Basia thought, *You'll kill us, but you won't kill us easy*. He took a deep breath and worked hard not to thump himself on the chest.

"You okay over there?" Naomi asked, not looking up from her work.

"Fine, fine. How are you?"

"Almost there," she said. "The trick is that we'll have a lot of thrust coming from one vector and not along our center of mass with the cable attached, and we only have maneuvering thrusters on three sides of the ship. So, we have to minimize rotation to port. *But*, we can't use the starboard fore thruster to counteract that rotation because the cable changes where our center of mass is. It's actually a fun problem to figure out."

"I have no idea what any of that means," Basia said. "Is it working?"

"I think it will. Alex agrees. We'll fire in a couple of minutes on the next rotation. Then we'll know."

"Great," Basia said.

The deck hatch clanged open and then closed again as Havelock pulled himself up into the ops deck. He'd changed out of his RCE jumpsuit and armor into loose-fitting gray sweats with the name ROCINANTE across the chest. The security officer was bigger than Holden, so if the clothes hung loose on him, they must belong to Amos. Basia thought maybe he wouldn't wear Amos' clothes without asking.

"The emergency stuff is in the airlock," Havelock said to Naomi's back. She hadn't looked up from her work when he came in. "I also threw a couple of EVA packs, some extra air bottles, and Basia's welding rig in there. I can't think of anything else we might need."

"Thank you, Dimitri," Naomi said.

"Dimitri?" Basia asked with a raised eyebrow.

"You've got a problem with that? Isn't Basia a girl's name?" Havelock shot back.

"It was my grandmother's name, and she was a solar-system-wide famous physicist, so it's a great honor to be named after her. I was the first grandchild."

“You two can shut up or leave the deck,” Naomi said. Then she hit the wall comm and added, “Alex, you ready up there?”

“Think so,” Alex replied with his heavy drawl. “Just a sec, lemme tweak one thing here...”

“Can we throw this up on the big screen?” Basia asked. “I’d like to see what happens.”

Naomi didn’t answer, but the main screen on the deck shifted from a tactical map to a forward telescopic view. The image rotated slowly past the brown-and-gray ball of Ilus, and then past the distant gray hulk of the *Barbapiccola*, and then on to the starry black.

“Missed our window,” Naomi said. “You almost ready?”

“Yeah,” Alex replied, dragging the word out to three syllables. “Now. Good to go.”

“Executing,” Naomi said and tapped a button on her screen, but nothing happened. The view on the big screen continued to slowly pan until Ilus came back into view. Then the *Barbapiccola*. Then, without warning, the *Rocinante* tipped violently forward and something very loud happened in the belly of the ship. A bright dot of fire and a curve of flame appeared in the planet’s atmosphere. Basia found that the far bulkhead was now traveling toward him at a slow but noticeable speed. The ship pitched again, the various maneuvering thrusters firing in staccato bursts. When the noise and movement was over, the view on the main screen was steady, locked onto the *Barbapiccola*.

“Huh,” Alex said. “I’m seeing activity from the moons.”

“Are they shooting at us?” Havelock said.

“Nope. Looks like they’re trying to knock down the gauss round,” Alex said. “Full points for optimism.”

“We’re not rotating anymore,” Basia said.

“No,” Naomi replied. “Give me any three directions of thrust and I can find a way to stop us. Now we just keep it here firing and adjusting, and we should be adding some speed to our orbit.”

Basia looked down at the timer counting away the *Barbapiccola*’s remaining life. It had added a little over four minutes. “How often can you fire?”

“About every five minutes or so, if we don’t want to overheat the rails and burn the batteries out. At least, every five minutes until the batteries are

dead.”

“But—”

“We’ve just stopped the degrading orbit, but not much more,” Naomi said.

“*Israel’s* coming back around,” Alex said. “She dumped something off.”

“Goddammit,” Naomi muttered. “Give us a fucking break, will you guys? What are they dropping?”

“Men in suits,” Alex said.

“It’s the militia,” Havelock said. He’d pulled himself over to a tactical display and was zooming it in and out. “Twelve of them, in vacuum armor with EVA packs. Plus an equal number of metallic objects of about human size. Not sure what those are.”

“Any speculation on what they’re doing?” Naomi said, switching her view to match his.

“They’re engineers. They know how crippled we are. How vulnerable. So my guess is they’re going to try to kill us.”

Chapter Forty-Eight: Holden

Life at the naval academy had been so stressful for Holden that at the end of his first term he'd celebrated by going to a party and drinking until he passed out for twenty hours. It had been his first lesson on the difference between unconsciousness and sleep. They might seem the same, but they weren't. After twenty hours, he'd woken feeling totally unrested, and the morning PT the next day had almost killed him.

Riding on Miller's material transfer network, it was difficult to get any sense of the passage of time. The first time Holden came to, his hand terminal told him ten hours had passed. He could tell he'd spent it unconscious rather than sleeping because he felt exhausted and sick. His throat hurt, his eyes burned like they'd been sandpapered, and all of his muscles ached. It almost felt like a flu, except that the antivirals he took every three months made that pretty much impossible. He turned on his armor's diagnostic system, and it gave him a series of shots. He had no idea what. He drank half the water in his canteen and closed his eyes.

It was nine hours later when he woke again, and this time he was almost rested, the soreness in his throat gone. At some point he'd passed the threshold from unconsciousness to sleep, and his body was rewarding him for it. He stretched out on the metal floor until his joints popped, then drank the rest of his water.

"Wakey wakey," Miller said. He slowly appeared in the darkness, surrounded by a halo of blue light, as if someone were turning up his dimmer switch.

"I'm awake," Holden replied, then rattled his empty canteen at Miller. "But you stuffed me into this cattle car so fast I wasn't able to get supplies.

Gonna get pretty thirsty if there isn't, you know, an alien drinking fountain for something."

"We'll see. But that's actually the least of our problems right now."

"Says the guy who doesn't drink."

"There's a damaged piece of the system ahead," Miller continued, "and I'd hoped we'd be able to get around it. No such luck. We're on foot from here."

"Your fancy alien train is broken?"

"My fancy alien material transfer system has been sitting unused for over a billion years and half the planet just exploded. Your ship was built less than a decade ago and you can barely keep the coffee pot running."

"You are a sad, bitter little man," Holden said as he climbed to his feet and pushed against the train door. It didn't open.

"Hold on," Miller said and vanished.

Holden turned the brightness up on his terminal and spent a few minutes checking over his equipment while he waited. Miller had grabbed him right after his final patrol around the settlement, which meant he had his armor, his pistol, and quite a few magazines of ammunition, all of which was pretty likely to be useless. He also had one empty canteen, no food, and a suit medical pack that was running low on almost everything, all of which would have been much handier to have fully stocked. When his body finally woke up enough to be hungry, he expected to be quite willing to trade his gun in for a sandwich. He didn't think the alien structures would have many vending machines.

Ten minutes passed, and his anxiety shifted to impatience. He sat down again and tried to call the *Rocinante* on his hand terminal, but got a failed connection message. He tried Elvi, Lucia, and Amos. All failed. Whatever the alien subway was made out of, it was blocking his signals to the hub on the *Roci*. It had to be that. The alternative was that the *Roci* wasn't working, and that opened up too many bad scenarios. He pulled up a mindless pattern-matching game and played that for a while, until the terminal gave him a low-battery warning and he turned it off.

After an hour passed, he started to get nervous. He wasn't claustrophobic, and he'd spent most of his adult life in tiny cabins on space ships, but that didn't mean he relished the idea of dying alone in a small metal box deep under the earth. He kicked the container's door a few times

and shouted to Miller, but got no reply.

Which was, in its own way, fairly alarming.

The container he'd been sleeping in during the long trip north was empty. The only tools he had with him were used for repairing his armor and weapons. There was nothing that could cut through the metal or bend it. He kicked the door again, this time putting enough effort into it that it hurt his shins. It didn't move at all.

"Huh," he said out loud. If Miller had brought him all this way just to let him die in an abandoned train car, it was the longest prank setup in history.

Holden was doing a mental inventory of everything he was carrying, trying to figure out if any combination of things might make an explosive powerful enough to blow the door off, and carefully ignoring the fact that any such explosion would probably liquefy any biology inside the small metal compartment, when a loud metallic groan came from outside the cart that rose in pitch to a shriek. The compartment shuddered and rocked. A long series of powerful hammering sounds assaulted him. Then another metallic scream that grew to deafening levels.

The door to the compartment vanished, torn from the container in one massive blow. On the other side stood a nightmare.

At first glance, it looked like a massive collection of appendages and cutting tools. It stood on six of its limbs, and waved four others in the air like a crustacean made of steel and knives. Whipping through the air around the heavier cutting arms were a dozen or more tentacles of what looked like black rubber. As he watched, two of the tentacles gripped the inside edges of the doorway and bent them out with fearsome strength.

He pulled his pistol, but didn't point it at the thing. It felt very small and inadequate in his hand.

"Put that away," the monster said in Miller's voice. "You'll put your eye out."

Holden hadn't thought much about the fact that every time he heard Miller's voice over the last year, it had been a protomolecule-induced hallucination. But at the sound of the detective's voice in the air, actual vibrations moving through the atmosphere and hitting his eardrums, the strangeness of it made him feel a little lightheaded.

"Is that you?" Holden asked in what he was pretty sure was the new universal winner for stupid questions.

“Depends what you mean,” the Miller-bot said and backed away from the opening. It was surprisingly quiet for such a huge metallic monster. “I’m able to get into the local hardware, and this thing was in pretty good shape for having missed its three-month warranty check by a thousand million years or so.”

Miller did something, and suddenly Holden could see the detective in his rumpled suit standing where the monster had been. He shrugged and smiled apologetically. But even as Holden saw a projection of Miller, superimposed over it he saw the robot. It was doing the same shrug, though instead of hands it used two massive serrated crab claws. It would have been comic if it hadn’t come with a splitting headache.

“One or the other,” Holden said, squeezing his eyes shut. “I can’t see both things. It breaks my brain.”

“Sorry. No problem,” Miller replied, and when Holden opened his eyes again only the robot was there. “Come on, we have a lot of ground to cover.”

Holden hopped out of the material transfer container and onto a flat metal floor. Various sections of the Miller-bot’s carapace glowed with a faint light, and unlike the blue light that had always accompanied the Miller ghost, it actually illuminated the space around it.

Pointing at one glowing limb, Holden said, “Can you make that brighter?”

In answer, all of the glowing sections of the robot intensified until the tunnel was as bright as noon. The reason for the material transfer cart’s stoppage became apparent. A couple dozen meters ahead, the metal tunnel was blown apart and filled with rocks and debris.

Reading his mind, Miller said, “Yeah. Not everything is handling the reboot well. Power node for the mag-lev woke up bad and blew itself up. Only it’s not exactly mag-lev. Close enough, though, you can get the picture.”

“Can we get past it?”

“Well, we can’t repair the track, but I can get you out. Making passages,” the Miller-bot said, waving one massive claw in the air, “is what this thing’s for. He used to dig and maintain these tunnels. Hop on.”

“You’re fucking kidding me.”

“No, seriously, climb on. This guy can move faster than you can on

foot.”

“Miller,” Holden said. “You are made entirely out of cutting edges and pinch points.”

One of the black tentacles twisted around, looking over the robot’s carapace carefully. “Hold on,” Miller said, and with a hum and a few metallic clanks, the torso of the robot twisted into a new configuration, leaving a wide flat spot on its back. “There you go.”

Holden hesitated for a moment, then climbed up one of the robot’s legs and onto its back. The Miller-bot trundled forward to the damaged section of tunnel and the four big forward limbs went to work, tearing out the twisted metal of the tunnel walls and clearing the earth and stone that had filled the space. The machine worked with speed, precision, and a terrifying casual strength.

“Hey Miller,” Holden said, watching the robot peel up a two-meter section of the tunnel’s metal flooring and rapidly cut it into tiny pieces. “We’re still friends, right?”

“What? Ah, I see. When I’m a ghost, you yell at me, tell me to get lost, say you’ll find a way to kill me. Now I’m wearing the shell of an invincible wrecking machine and you want to be buddies again?”

“Yeah, pretty much,” Holden replied.

“Nah, we’re good.”

He punctuated the words with one last massive blow that shattered a two-ton boulder into rubble. By hunching down on his six legs, Miller was able to squeeze through a small opening in the tunnel blockage. Holden lay down flat on the robot’s back, a jagged piece of the tunnel roof passing less than three centimeters from his face.

“Clear sailing from here,” Miller said, “but the mag-lev’s dead after this. No more trains.”

“We have any better idea what we’re looking for?”

“Only in general terms. About the time one-celled organisms on Earth were starting to think about maybe trying photosynthesis, something turned this whole damned planet off. Took it off the grid, and killed everything high enough up the food chain to have an opinion. If I’m right, the thing that did that’s not entirely gone. Every time something reaches into this one particular place, it dies.”

“Sorry to hear that,” Holden said.

“Don’t be,” Miller said. “It’s what we’re hoping for. Now buckle up. We’re going to try and make up some lost time.”

The robot bolted off down the tunnel, its six legs a blur of motion. Even moving at fairly high speed, the ride on its back was very smooth.

Holden surprised himself by falling asleep again.

He woke to something cold and rubbery touching his cheek.

“Stop it,” he said, waving one arm at the thing.

“Wake up,” Miller said, the detective’s voice rumbling though the robot’s carapace.

“Shit,” Holden said, sitting up suddenly and wiping saliva off the side of his face. “I’d forgotten I was here.”

“Yeah, I’d say a week of no sleep and too many amphetamines broke you a little,” Miller said. “You went on quite the bender.”

“Only without the fun.”

“I’ve been on a few myself,” Miller said and added a strange metallic laugh. “None of them are fun. But we’re about to hit the processing station, so get awake.”

“What should we be expecting?”

“I’ll tell you when I see it,” Miller said.

Holden pulled out his pistol and checked the magazine and chamber. It was ready to go. It felt a little like playing grown-up. Anything that the Miller-bot monstrosity couldn’t handle wasn’t going to be stopped by a few shots from his sidearm. But, like so many things in life, when you come to the spot where you’re supposed to do the rituals, you do them. Holden slid the pistol back into its holster but kept one hand on it.

It took him a minute to see it, but a point of light appeared ahead in the tunnel and then grew. Not reflected light from the robot, but something glowing. Holden felt a rush of relief. He’d traveled longer and farther than he knew in the small metal tunnels of the transfer system. He was ready to go outside.

The tunnel ended in a complex maze of new passages. A routing station, Holden guessed, where the arriving material was sent off to its various destinations. The walls were all of the same dull alloy as the tunnel. What

machinery was visible in the cramped space was inset into the walls and flush with them.

The Miller-bot paused for a moment, its tentacles waving at the tunnel choices. Holden could picture Miller standing still at the junction, tapping one finger on his chin while he decided which path to take. And then, suddenly, he actually *could* see Miller overlapping the robot. The headache returned with a vengeance.

“That one was kind of your fault,” Miller said. “It’s an interactive system.”

“Do we have any idea where we’re going?”

Miller answered by trundling off down one of the many new tunnels. A few seconds later, they’d exited into a cavernous new space. It took Holden a few moments to realize that it was all still artificial. The room they entered felt too big to be a construct. It was like standing at the core of the world and looking up for the crust.

All around stood vast silent machines. Some were moving, twitching. They were recognizably designs that the protomolecule favored. They had the same half-mechanism, half-organic look of everything else he’d seen them build. Here, a massive system of tubes and pistons rising from a gantry twisting into whorls like a nautilus shell. There, an appendage coming from the ceiling, half again as long as the *Rocinante*, and ending in a nine-fingered manipulating hand the size of Miller’s robot. Light poured into the space seemingly from everywhere at once, giving the air a gentle golden hue. The ground was vibrating. Holden could feel the soft pulses through the robot’s shell.

“We’re in a lot of trouble, aren’t we?” Holden asked, breathless.

“Nah,” Miller said, rotating the robot to test the air in every direction with its tentacles. “This is just initial material sorting and reclamation. Not even to the processing center.”

“You could park a battleship in this room.”

“It’s not for show,” Miller said, then the robot began scuttling toward a distant wall. “This is the point of this planet.”

“Huh,” Holden said. He found he was missing all of his other words. “Huh.”

“Yeah. So, as far I can figure it, there are minerals native to this system that are fairly rare, galactically speaking.”

“Lithium.”

“That’s one,” Miller agreed. “This planet is a gas station. Process the ore, refine it, send it down to the power plants, then beam the collected energy out.”

“To where?”

“To wherever. There are lots of worlds like this one, and they all fed the grid. Not the rings, though. I still don’t know how they powered those.”

The robot moved with machine speed toward a distant wall, and a section of the structure slid away. It left an opening the size of a repair shuttle, and more lighted machinery beyond. Some of the giant devices were moving with articulations more biological than mechanical. They pulsed, contracted, rippled. Nothing so prosaic and common as a gear or a wheel in sight.

“Are we moving through a fusion reactor right now?” Holden asked, Naomi’s question about radiation exposure on his mind.

“Nope. This is just ore processing. The reactors are all in that chain of islands on the other side of the world. These guys built for flexibility and redundancy.”

“You know,” Holden said, “one of the geologists told me this planet has been heavily modified. All of that was done just to turn it into a power station?”

“Why not? They didn’t need it for anything else. Not a particularly good planet, rare metals aside. And be glad they did. You think you can have an underground rail system last two billion years on any planet with tectonic action?”

Holden was quiet for a moment, riding the Miller-bot through the material refining plant as it throbbed around him. “It’s too much,” he finally said. “That level of control over your environment is too much. I can’t get my brain around it. What could kill these guys?”

“Something worse.”

The Miller-bot ducked under what looked like a conveyor system made of metal mesh wrapped around a pulsing musculature. It was clicking and groaning as part of the mechanism tried to move while the rest of it remained frozen. Holden had a sudden, vivid memory of a goat he’d found as a child. It’d had one broken leg wrapped in a barbed-wire fence, the other three feebly pushing at the ground to free it.

“So there’s the thing,” the Miller-bot said, waiving its claws around at the machinery, “this right here was the point of this place. It’s why this planet *exists*. And right around here somewhere is a blank spot in the planetary network. A place we can’t touch.”

“So?”

“So, whatever’s in that blank spot, it’s not from around here. And if it’s a bullet, then whoever did this knew to shoot for the heart.”

OceanofPDF.com

Chapter Forty-Nine: Havelock

Havelock moved across the surface of the *Rocinante*, magnetic boots clicking to the exterior plating, then lifting free again. To his right, the sun—a sun, anyway—shone brighter than a welding torch. To his left, the great, clouded curve of New Terra filled his personal sky, the planet looming in. The upper boundary of the exosphere was invisible if he looked down, the gases too thin for an imperfect human eye to make out. The vast, sweeping curve of it before and behind the ship was hardly more than a grayness against the void. It felt too close. It *was* too close. He could already imagine the vicious friction tearing away his suit, the ship, the thin air burning him worse than a belt sander. The angry hot slag that had been one of the defense moons glowed high above, dull red against the pure white stars. His feet grabbed on to the plating, held, released.

“How’s it looking out there?” Naomi asked in his ear.

“As well as could be expected. Kind of wish that planet wasn’t quite so up in my face. I keep feeling like it’s trying to pick a fight.”

“Yeah, I was thinking that too.”

The point defense cannon was a single thick barrel on a hemispheric swivel joint, the metal smooth as a mirror. The hole at the end was a black dot small enough that Havelock could have blocked it with the tip of his ungloved pinky finger. The little tungsten slugs it spat out would have been small enough to hold in the palm of his hand, and the feed would have spat them out by the hundreds every second. It was a machine of inhuman power and sophistication, built to react faster than a human brain and with enough force to shoot down anything that threatened the ship.

Without power, he could use it to hide behind.

He lay flat against the decking, just the toes of the mag boots engaged. He took the rifle off his back, synced it to the suit's HUD, and a handful of new stars appeared. Red for the militiamen, green for whatever the other things were they were hauling with them. The *Rocinante* bucked under him, the horizon of the ship shifting as the rail gun fired. A half dozen streaks of blue danced from the defense moons above, marking the path of the rail gun's round with the instantaneous violence of lightning. He shifted a few centimeters, correcting for the movement of the ship, reacquired his targets, and opened the general frequency.

"Gentlemen," he said. "This really isn't something we need to be doing."

He saw them respond. Their bodies stiffening, their heads craning while they tried to look for him. No one came on the channel. He zoomed in on them. Their faceplates were darkened against the sun, making them anonymous. But he knew all of them.

"Honestly, why? What's this for? That ship down there and everyone on her is going to die. We're doing everything we can to put that off, but you guys have done the math, right? You have the same numbers we do. You don't gain anything from this. It's just being mean. You don't need to do that."

One of the dots flinched. At a guess, the chief engineer was shouting on whatever frequency they were all using now. Drowning him out. Havelock let his sight drift to one of the other dots. The angle made it hard to parse exactly what he was seeing. A gas storage tube of some kind, with complications of wire and circuit board on either end. Some kind of improvised missile, he guessed. They would have been pointless if the PDC he was hiding behind had been working. He wondered whether the engineers knew the *Roci's* defenses were down, or if they only guessed. Or if the prospect of their own deaths and their hatred of the Belters had taken them far enough that the risk of being killed in order to deny the *Barbapiccola* a little more life seemed worth it to them. No matter what, it was disappointing.

"Walters? Is this how you want to go down? Don't listen to them for a second. Seriously, just turn off the radio. We don't have to hurry here. Do you think you're doing the right thing?"

They were visibly closer now than they had been. They weren't

accelerating toward him, but they weren't braking either. Havelock's HUD made the calculation. They'd be at the *Roci* or the *Barb* or the tether between them in about twenty minutes.

"You guys need to slow down now," Havelock said. "You're still my people, and I don't want to hurt any of you."

The radio clicked to life. The chief engineer's voice was thick with anger and contempt. "Don't try to play that on us, you traitorous bastard. Your little friend's PDCs are powered down. We saw that before we dropped. Do you think we're stupid? We have orders to bring you and the Belter bitch back to the *Israel* and put you both in the brig."

"Orders?"

"Straight from Murtry."

Because, Havelock figured, it was precedent. RCE would be able to assert that it had protected its claim down to the last minute. Murtry's legacy would be that he hadn't given up a centimeter. Not on the ground, not in space, not on the abstract legal battlefield. Nowhere.

There was a time not that long ago when Havelock would have thought there was a kind of hard purity in that. Now it just seemed weird and kind of pathetic.

"Okay," he said. "You're right. The PDCs are down, but you haven't thought the rest of this through. I am outside the ship. I'm armored. I have an integrated HUD and a weapon that can reach any of you right now. None of you have any cover. The reason you guys are alive right now is because you're my guys, and I don't want any of you hurt."

He watched them react. It was less than he'd hoped. The *Roci* bucked again. The bolt of the rail gun and the attacking streaks of energy from the moons. Havelock reacquired the targets. It took a fraction of a second for the HUD's alert to make sense to him. Four of the targets were moving. Fast. Four of the gas tanks, accelerating hard, a cloud of thin mist flowing out behind them as whatever residual vapor had been trapped in it froze into snow.

"You've got incoming," Alex snapped in his ear, and Havelock lifted his gun. One of the missiles was clearly flying off course, a vicious spiral wobble leading it down toward the planet. He took aim at one of the three remaining and blew holes on both sides of the tube. The improvised missile wobbled as whatever steering device the *Israel*'s engineers had put on the

back struggled to use the last of the escaping ejection mass to correct the course, but the venting gases were too destabilizing. It drifted up and began to turn. He shifted to the two remaining targets. He wasn't going to have time to get them both, but he managed to sink two rounds in the one that was heading straight toward him, trying to knock out the payload.

The one remaining tube hit the *Roci's* skin eight meters to Havelock's right, and the world went white. Something pushed him, and something hurt, and the sound of his suit radio was still there, but it was faintly distant. His body seemed very large, like it had expanded to fill the universe or the universe had shrunk down until it fit in his skin. His hands seemed a very long way away. Someone was shouting his name.

"I'm here," he said, and it felt like hearing a recording of himself. The pain started ramping up. His HUD was flashing red medical warnings, and his left leg was frozen stiff and unbending. The stars spun around him, New Terra coming up from below him and then spinning up past his head. For a moment, he couldn't find the *Rocinante* or the *Barbapiccola*. Maybe they were gone. He caught a passing glimpse of the *Israel*, though, far off to his right, and so small he could almost have mistaken it for a tightly packed constellation of dim stars. His HUD spooled up a fresh warning, and he felt a needle fire into his right leg. A cold shudder passed through him but his mind seemed to clear a little.

"Havelock?" Alex said.

"I'm here," Havelock said. "I'm not dead. I think I've been knocked off the ship, though. I seem to be floating."

"Can you stabilize?"

"I don't think so. The suit may be malfunctioning. Also I seem to have taken a lot of shrapnel in my left leg and hip. I may be bleeding."

"Do you have containment? Havelock? Are you losing air?"

It was a good question, but his gorge was rising. The spinning was making him sick. If he puked in the helmet, things would go from bad to worse very, very quickly. He closed his eyes and focused on his breath until he thought he could stand to look again. When he did, he kept his gaze on the unshifting images of the HUD readout.

"I have containment. I can breathe."

He heard Naomi sigh. It sounded like relief. He was flattered. The red dots of the militiamen spun past in the corner of his eye. He couldn't tell if

they were still getting closer or if they'd stopped. Something bright happened in the atmosphere. The rail gun firing again. The planet rose up from below him and disappeared over his head.

"Hang on, coyo," Basia said. "I'm coming out."

"Belay that," Havelock said. "The guys from the *Israel* have more of their improvised missiles. They have guns. Stay inside."

"Too late," Basia said. "Already cycled out the lock. I just need too... Shit, that's bright."

Havelock twisted to the left, finding the *Rocinante* at last. The explosion hadn't thrown him as far as he'd thought, but he was on the drift now. Every breath took him farther from the metal-and-ceramic bubble of air. He wondered if he stayed out here whether his body would outlast the ships. His air supply wouldn't. The improvised missile had left a bright scar on the *Roci*'s outer hull, but didn't look like it had made any holes. Tough little ship.

"Huh," Basia said. "Well, they're shooting at me."

"Get back in the ship," Havelock said.

"I will. In a minute. Now where did you... Ah! There you are."

The grapnel struck his left arm, the gel splashing out and hardening in almost the same moment. At the first tug, his right leg shrieked in pain. But the vectors were such that his uncontrolled spinning slowed. The red dots of the militia were much closer now. Basia was in real danger of being shot. And there were still eight more improvised missiles.

The *Rocinante* jumped. The rail gun path through the high atmosphere glowed. Had it really only been five minutes? He had to have missed a couple of rounds. Or maybe getting blown out into space just changed how he experienced time. Or maybe he'd seen them and then forgotten.

"Don't pull me too fast," Havelock said. "You're going to have to put just as much energy into stopping me once I'm there. I could knock you off." Or *smash against the hull*, he didn't say.

"I've been in low g more than I haven't," Basia said, a real amusement in his voice. "Don't worry yourself."

The slow-spinning *Rocinante* came closer, Havelock's own spin making it seem like the universe and the ship and his own body were all in slightly different realities. Basia was a darker blot against gray ceramic and metal. Havelock's HUD cheerfully informed him that his blood pressure had been

stabilized. He hadn't realized that it was unstable. The suit's attitude jets were still off-line, but Basia jumped up to meet him before he touched the deck, wrapping arms around his shoulders in a bear hug while Basia's suit slowed them.

"You need to get inside," Havelock said as his left mag boot locked against the hull.

"I was about to say the same to you," Basia said. "How much shrapnel did you take?"

Havelock looked at his leg for the first time. The suit was dotted with emergency sealant, the result of a dozen holes at least. "All of it, apparently."

"I've got fast movers," Alex said.

Havelock turned, rifle up, ready to shoot the missiles down before they reached him or die trying. It took a few seconds to find them. The green dots weren't heading for him. They were tracking down toward the planet. Toward the *Barb*.

"Okay," he said. "Hold on."

"I think they're still shooting at you," Naomi said. He moved forward, his leg not painful now so much as eerily numb. The shifting of the *Rocinante* was throwing off his aim. His HUD showed a lock and he pulled the trigger. One of the missiles exploded. Basia was hunched down, hands and legs against the decking, a stream of obscenity coming from him sounding like a chant. Havelock tried to move his mag boots, but he couldn't get them to respond. The *Roci* bucked.

"The crew of the *Barb*'s braced," Alex said. "First impact in—"

A new brightness bloomed below them. Havelock felt it, the impact traveling through the tether to the *Roci* to his boots almost instantaneously. Through the radio, he could hear Alex groan.

"Okay," Naomi said. "This is a problem."

Below them, the *Barbapiccola* was starting to tilt. The force of the explosions just enough to give it a little velocity, a tumble so slow, he could almost pretend it wasn't there. Almost. Not quite. The webwork of the tether was shredded. Two strands still held, but the others were drifting. One was cut in two, the others might have broken free of their foot supports or pulled the supports off the skin of the ship. He wasn't sure. New Terra was so large below, it filled his field of vision. A wave of vertigo washed

over him, and he had the near-hallucinatory sense that the planet was a monster rising up through a vast ocean to swallow them all.

“Alex,” Naomi said, “drop the cable.”

“No!” Basia shouted at her.

“Not responding,” Alex said. “The release seems to be damaged.”

The *Roci* bucked, and the tether snapped taut.

“Cease firing!” Basia shouted. “Stop firing the rail gun!”

“Sorry,” Alex said. “It was on automatic. It’s shut down now.”

“I’m going to the *Barb*,” Basia said. “I’ve got my welding rig. May be something I can do.”

“That’s not going to work,” Naomi said. “Just cut it.” The *Barbapiccola* was a good ten degrees off the stable orbit she’d had. Tumbling.

“I’m not coming back in,” Basia said. “And I’m not cutting it. I gotta go look.”

“You remember they’re still shooting at you, right?” Naomi said.

“I don’t care,” Basia said.

“I’ll cover him,” Havelock said. “I can do that.”

“Can you move?”

Havelock consulted his HUD. His shredded leg was immobilized and under pressure to contain the bleeding. One of his attitude jets had been holed. The air in his suit smelled sharp, like melting plastic. That couldn’t be a good sign.

“Not really, no,” he said. “But Basia can get me to cover. The outer airlock hatch on the *Roci*, maybe. I can stay there and snipe.”

“Hurry, then,” Naomi said. “They’re still getting closer, and eventually they’ll get to a range they might hit something.”

Havelock disengaged his mag boots and turned toward the Belter. “All right. If we’re going to do this, let’s go.”

Basia clapped a hand on Havelock’s arm and started dead hauling him down the ruined side of the ship. The pockmarks and bright spots where the debris of the shuttle had struck were everywhere, now joined by the scar of the improvised missile. A soft white plume curved into the void where something was venting. Time seemed to skip, and he was at the airlock’s outer door. It was open, waiting for him. The red dots showed that his men were still ten minutes away. The *Barb* was above him now, and the planet above that. Not a beast rising to devour him, but a whole clouded sky

falling down to crush him.

“Are you all right?” Basia said. “You can do this?”

“I’ll live,” Havelock said, and immediately realized how completely inappropriate that had been to say. “I’m all right. Lightheaded, but my blood pressure’s solid.”

“Okay, then. I’ll be right back. Don’t let those sons of bitches screw this up any worse.”

“I’ll do my best,” he said, but Basia had already launched himself up along the tether. Havelock checked his rifle, his HUD. He still had to adjust for the *Roci*’s spin, but he found the little red dots quickly.

“All right, guys,” he said. “You’ve made your point. Now let’s just dial this back. There’s still time. I don’t want to hurt anybody.” The words were surreal. Like a poem from some other century. A litany for deescalating conflict. No one really appreciated how much of security work was just trying to keep things under control for a few more minutes, giving everyone involved in the crisis a little time to think it all through. The threat of violence was just one tool among many, and the point was not making things worse. If there was any way at all, just not making things worse. It occurred to him that Murtry was actually really bad at that part of the job.

His HUD marked a fast-moving object. A bullet or a slow meteor. From the angle, probably a bullet. Another one was moving on a track to pass Basia. It was going to miss too, but not for much longer.

“All right,” Havelock said, raising his rifle. “I’m counting to ten, and anyone that’s still on approach, I’m going to have to put a hole in you. I’ll try to just disable your suits, but I’m not making any promises.”

The red dots didn’t change their vectors.

It was strange. He’d come all this way, faced all these dangers. He was falling by centimeters into a planet and struggling for a few more minutes or hours of life. And the thing that worried him most was still that he was going to have to shoot somebody.

Chapter Fifty: Elvi

The cart had been designed for use on rough terrain and shipped out to a planet without roads. It wasn't smooth, but it was fast, and the roar of the generator and the whirring of the motors had made a kind of white noise that Elvi's brain tuned out after the first few hours, leaving her in something like silence. And all around them, the ruins of New Terra rose up and then passed away. The storm that had scoured First Landing into scraps and mud hadn't been local. All of the landscapes they passed through were shattered and drowned, but they were still fascinating. Still beautiful.

A forest of thin red bodies halfway between trees and gigantic fungi lay on their sides, the cart's wheels leaving tire tracks across their flesh. Flying creatures no larger than her splay-fingered hand fell into line behind the cart for hours, attracted by the noise or the movement of the spray of atmospheric hydrocarbons. She wondered how the frail creatures had survived the planetary disaster. When night fell, three vast columns of luminous dots rose up into the sky like skyscrapers built from fireflies. She didn't know if they were organisms like the mimic lizards or artifacts like her butterflies. A huge animal, as tall and wide across as an elephant but segmented like a caterpillar, lay dead and rotting along the crest of a low hill, structures like two interlocking sets of ribs crossing its massive sides and gnat-small carrion eaters flying around it like a fog. A silver-and-blue structure rose from a pool of grayish rainwater, collapsed, and rose again. It could have been anything, but she could only see its behaviors as play. Splashing in puddles. It was all she could do to keep from stopping and looking at it all.

A whole biosphere—or two or three—passed by her, teasing and

hinting. She wished she could have seen it all before the storm. At best now, they would be able to guess at what had come before and see what came after. She took consolation by reminding herself that was always true. All of nature was a record of crisis and destruction and adaptation and flourishing and being knocked back down again. What had happened on New Terra was singular and concrete, but the pattern it was part of seemed to apply everywhere and maybe always. Even the aliens that had made the artifacts, the protomolecule, the rings, had suffered some vast and cosmic collapse.

At dawn the three of them shared the last of their food. There was still enough water to last a few days, but they would be hungry ones, and after that, she guessed they'd try to find something on the planet that they could stomach. They would fail and die. Unless Holden really could turn the reactors back on and drop something from the ships. A steep-walled canyon blocked their way, the erosion of centuries exposing strata of rock as even and unvarying as the pages of a book. It took the cart's expert system half an hour to find a path down and back up.

When she had mentioned how lucky they were that they hadn't hit anything like a mountain range, Faye had laughed.

"You'd need tectonic plates first," he'd said. "This planet doesn't have mountains, it has hemlines."

None of them talked much, the noise of the cart drowning out anything short of shouting, but even if they'd been driving in silence, she didn't have the sense that Amos Burton would have spoken. He spent the day and a half of travel sitting at the cart's front edge, legs folded, his eyes on his hand terminal or the horizon. She thought there was a growing anxiety in the man's broad face, fear for Holden and for the ships above them and the planet all around, but she could also have been projecting her own feelings on him. He had that kind of face.

In some places, the tracks of the other cart—Murtry and Wei's cart—had wandered off on a different heading from their own. Sometimes the tracks got lost in the soft mud or vanished as they crossed wide, wet expanses of stone. But it always returned, the doubled track of their tires leading the way north into with wilderness. The headlights showed a swath of gravel and pale yellow snail-like organisms that were crushed under the cart's wheels. The air was colder, either because they were heading north or because the permanent cloud cover was keeping the energy of the sun up

away from the planet's surface. Elvi had dozed as much as the emptiness in her belly permitted, her head on Fayez's lap, then they traded and he dozed in hers. Her dreams had been of Earth and trying to guide a pizza delivery service through the hallways of her university lab. She woke knowing that something had changed, but it took her a long moment to realize what. The cart was silent. She sat up, rubbing her eyes.

The other cart was in the headlights, spattered with mud and scarred along the side where it had scraped against something harder than its alloy siding. Amos dropped down and walked slowly around it twice, once looking at the cart and once looking out into the darkness.

"What is it?" she asked. "Is everything okay?"

"Their motors burned out," Amos said as he hauled himself back up to the cart bed. "Got mud in the axles and didn't clean it out. Wherever they went from here, it was on foot."

"Are we close to Holden?"

"Oh yeah," Amos said, holding up his hand terminal. "This was the last blip we saw. It was short, but it gave us a pretty good lock on his position. We'll move toward it and hope he pops up again soon." The map didn't give her a sense of scale, but there were two indicators on it—one for them and the other for the captain. "If I'm right, we're getting right toward the end of this. And we're still the ones with the wheels. You two'd better lie down on the deck from here on in."

"Why?" Fayez asked.

"Case they decide to shoot someone," Amos said, restarting the generator.

Over the roar, she didn't think Amos heard Fayez say, "All right. That makes sense." But she did.

It was still the small hours of the morning—the long stretch between midnight and dawn—when they came to the structure. At first it was only a glittering in the darkness, like a bit of starfield. For a time, she thought it might be a break in the clouds. But the closer they came, the more obvious it became that it was something else.

In the darkness, the details were hard to make out, but it seemed to share the same almost organic architecture with the ruins back in First Landing, but a couple orders of magnitude larger. She had the sense of being at the edge of one of the huge industrial ruins of the European west coast, a place

where something world-shatteringly huge had once made its power felt, and now had left its carapace behind. When the first pale flakes of snow filtered down through the headlights, she thought at first they were ashes.

“Is that where we’re going?” Fayez asked.

“Think so,” Amos said. “We haven’t had a solid update on the captain in a couple hours, and that up there’s about where the last reading came. Figure once you get inside, the signal don’t penetrate.”

“Or it ate him,” Fayez said. “It could have just eaten him.”

“Captain’d be a tough meal to swallow,” Amos said.

The cart rolled on, moving toward Holden’s last known position. Huge black spikes rose out of the ground, some of them swiveling to track their passage. The snow thickened, sticking to the ground and the cart. The structure remained clean, though, the white melting away. *It’s warm*, Elvi thought, and couldn’t explain why she found the idea so unnerving.

The cart passed under an archway ten meters high and into the structure itself. The snowfall stopped. All around them, the walls glowed, filling the space with a soft, shadowless light. The air was warmer and smelled of something sharp and acrid, like alcohol fumes, but harsher. The cart shifted one way and then another, hunting for the last, fading traces of Holden’s electrical scent before giving up and stopping. Amos flipped it over to manual and took direct control. The pathways moved in swirls and loops for a time, then broadened, opening. The roof of the place was lost in darkness, and long tubes of what could have been conduits or vasculature rose up out of the earth and flowed together, inward, forward, toward whatever the functional heart of the place had been. The cart slowed. Amos took his shotgun from the deck and fired it. The report echoed.

“What are you shooting at?” Elvi asked.

Amos shrugged. “Nothing in particular. Just thought, you know, *loud*.” He cupped his hands around his mouth and shouted. “Captain! You out there? *Holden!*”

“Are we sure he’s in here?” Fayez said.

“Nope,” Amos said, then went back to shouting. “Captain!”

A figure stepped from behind a massive machine, fifty meters in front of them. It was the size and shape of a human, and Elvi felt a moment’s disorientation at how utterly out of place it seemed. Amos took a fresh grip on the shotgun and angled toward it. The figure stood, feet shoulder width

apart, hands at its sides, as the cart approached. When they were within ten meters, Amos shut the generator down.

“Hey there,” he said, his voice open and friendly and insincere.

“Hey yourself,” Wei answered, lifting her chin.

Amos dropped from the side of the cart, his shotgun in his hand almost as if he’d forgotten it was there. Elvi looked at Fayez, who shrugged. She slid down to the ground, moving forward slowly. She kept her hand against the front tire, the tread warm against her palm, but cooling.

“What’re you up to?” Amos asked.

“Work,” Wei said, nodding to the vast structure all around them. “RCE’s got a claim on all of this. I’m just making sure no one infringes on it.”

“Meaning the cap’n.”

“Meaning anyone,” Wei said. Her voice was harder now.

“Well, it’s a fucking ugly place if you ask me.”

“It is.”

“We really going to do this? Because I think it’d be a hell of a lot more fun for me to get Holden and you to get Murtry and we all see if there’s not some way for the doc back there to find something with alcohol in it on this mudball.”

“Yeah, that does sound like fun,” Wei said. “But I’m on duty.”

Fayez came up from behind Elvi, his arms crossed over his chest. His eyebrows were pulled together in distress.

“So thing is?” Amos said. “Yeah, Holden’s in there someplace, and I’m figuring Murtry’s in there looking for him.”

“Could be.”

“So when I get back up there and drive on by—”

“You don’t want to do that, Amos. My orders are no one goes in. Hop back on and head the other way, you and me have no problems. Try to infringe further on RCE property, and I’m going to have to shoot you.”

Amos rubbed his scalp with his left hand. The shotgun in his right seemed larger somehow. Like the threat of violence gave it significance and the significance gave it weight. Elvi found herself breathing in quick, short gasps and thought for a moment that something had changed about the air itself. But it was only fear.

“Captain’s in there trying to get the reactors back on,” Amos said.

“Then he’s trespassing and he’ll need to leave.” Wei’s stance softened

for a moment, and when she spoke there was something like sorrow in her voice. Not the thing itself, but like it. “When it’s time to go, there’s worse ways than dying at your post.”

Amos sighed, and Elvi could see his shoulders slump. “Your call,” he said, raising the shotgun.

The report came from behind them, and Amos pitched forward.

“Down!” Murtry shouted at their backs, and Elvi hunched as automatically as a reflex. Fayeze was pressed against her on one side, the massive tire on the other. The shotgun boomed at the same time as a sharp crack of a pistol sounded. Elvi looked out, and Wei was on the ground, her arms thrown out at her sides. Amos was struggling to his knees. His back was to her, and there was blood on the back of his neck, but she couldn’t see where it was coming from. Murtry strode past her, firing his pistol, two, three, four times. She could see Amos’ armored back quiver with every shot. Murtry wasn’t missing. Her own scream sounded high and oddly undignified.

Murtry rounded the cart as Amos turned with a roar, the shotgun fired three times, the concussions beating at the air. Murtry stumbled back, but didn’t fall. His next shot drew a small fountain of blood from Amos’ thigh, and the big man collapsed. Murtry lowered his gun and coughed.

“Doctor Okoye. Doctor Sarkis,” he said. The armor over his chest was shredded. If he hadn’t been wearing it, Amos’ blast would have blown the man’s heart back out through his spine. “I have to say I’m disappointed by your decision to come here. And your choice of company.”

Amos was gasping, his breath ragged. Murtry stepped delicately across to him and shoved the shotgun away. The metal hissed against the strange chitinous flooring.

“You shot him,” Fayeze said.

“Of course I did. He was threatening the life of one of my team,” Murtry said, walking over to Wei. He sighed. “My only regret is that I was unable to save Sergeant Wei.”

Tears filled Elvi’s eyes. She felt sobs shaking her. Amos lifted a hand. The thumb and forefinger were missing, and bright pink bone showed through the blood. She looked away.

“What are you talking about?” Fayeze said. His voice was shaking.

“Doctor Sarkis? You have something you’d like to add?” Murtry said,

slipping a fresh magazine into his pistol.

“You set this up. You set *all* of this up. You put her there to distract Amos and you shot him from behind. This isn’t just something that happened and you did the best you could and poor fucking Wei. You *did* this!”

“If Mister Burton here had done as he was asked and left the site—”

“He was trying to save us!” Fayez shouted. His face was red and he stepped forward. His hands were in fists at his sides. Murtry looked up, something a little less than polite interest in his eyes. “He and Holden are trying to save us! You and me and Elvi and everyone. What the hell are *you* doing?”

“I’m protecting the assets, rights, and claims of Royal Charter Energy,” Murtry said. “What I’m *not* doing, and I hope you understand this, is running around in a circle with my dick in my hand whining about how nothing matters because we’re all going to die. We all knew when we got on the *Edward Israel* that we might not make it back. That was a risk you were willing to take because it meant you could do your job. I’m no different.”

“You got Wei killed!” Fayez shouted. Elvi put her hand on his shoulder and he shrugged it off. “She’s dead because of you!”

“Her turn now, my turn later,” Murtry said. “But there are some things I need to get done before that.”

The security chief checked his gun and looked down at Amos Burton staring raw hatred up at him. Murtry leveled the barrel at the bleeding man’s face. *Look away, Elvi thought. Don’t watch this happen. Look away.*

Fayez hit Murtry in the nose. The movement was so fast and awkward and artless that at first Elvi wasn’t sure it had really happened. She watched the expression in Fayez’s widening eyes as he understood what he’d done, and then when he committed to doing it again. Murtry turned his pistol away from Amos, swinging it toward Fayez, and the geologist ran into him with a shout. Murtry stumbled back but didn’t fall.

“Elvi!” Fayez shouted. “Run!”

She took a step forward. Amos was writhing on the ground, blood pouring from somewhere in his suit. His teeth were bared and crimson. He was grinning.

“Run!” Fayez screamed.

The great gray walls rose around them. False stars glittering. She couldn't breathe. She took one tentative step forward. Then another. She felt like she was moving through a gel, forcing every motion. *Shock*, she thought. *I'm in shock. People die from shock, don't they?* In her memory, Fayez shook his head and said, *Oh look, another excuse to go talk to Holden.*

Holden. She had to find Holden. She took another step, then another. And then she was sprinting, her legs and arms pumping, small animal grunts forcing their way out of her throat. Somewhere behind her, a pistol fired twice, and then a third time. She didn't look back. Everything in her, everything she was, focused only forward, along the wide, dark veins of the structure, forward to where they converged.

Elvi ran.

Chapter Fifty-One: Basia

Basia reached out to touch the tether, and it vibrated under his gloved fingers like a living thing.

Alex,” Naomi didn’t quite yell over the general comm channel, “I’m sending you a burn program. We have to keep that cable taut until Basia cuts it or the *Barb* is going to rip us both apart.”

“I’m not cutting it,” Basia repeated, but no one replied. He checked to see if his microphone was on.

“One,” Havelock said, ending his countdown. “Out of time guys.”

If the security man’s threats had any effect, Basia couldn’t tell. His HUD was still displaying the red lines of incoming gunfire. He ignored them.

Above him, the *Rocinante* began shifting and firing its remaining maneuvering thrusters in response to the slow rotation of the *Barbapiccola*, desperately trying to keep slack out of the cable. Two massive ships, each rotating in different axes, the cable could go from slack to thousands of tons of tension fast enough to tear the mounts out of the ships, and a chunk of the ship’s structure along with it.

“Basia,” Naomi said, her voice gentle. “I can’t give you much time. And you know this ends the same way no matter what.”

“I’m checking the connection to the *Barb*,” he said instead of answering her.

The mount was a mess of twisted metal and frayed cable. Pieces of the hull had been torn free by dislodged footings, and the ones that were still connected stretched and flexed with each gyration of the ship. Basia tried to calculate how much tension must be on the rigging and cable and failed. If it snapped free, it would probably cut him in half. If he did cut it, he’d need

Alex to put slack on it first.

"I'm not cutting it," he said again, more to himself than anyone else. Cutting it meant letting the *Barb* drift away, down into the upper atmosphere to rip apart and burn. To let Felcia burn. Alex had promised not to let that happen.

A pair of red lines drew themselves across his HUD and the words DANGER CLOSE flashed there briefly. He wasn't up on all his military jargon, but he could guess what that phrase meant. He pulled himself around the cable footing and took cover. Out in the blackness between the *Israel* and the *Barb*, twelve men in suits floated toward him on puffs of gas. They still had a few of their improvised missiles.

"Guys," Havelock said, real sadness in his voice.

"Havelock," Naomi yelled, "if you let those assholes shoot Basia you don't get to come back on my ship."

"Roger that," Havelock said sorrowfully. One of the twelve attackers spun sideways as a puff of white mist shot out of his EVA pack. The man continued to rotate wildly as he flew at high speed away from the others.

"One of you should go get him," Havelock said. "His EVA pack is toast."

Almost before he finished saying it, two of the remaining attackers jetted toward the disabled man, bringing their grapnel guns to bear.

"Havelock, you asshole," Koenen said on the open frequency where everyone could hear him. "I'm going to enjoy stomping a mudhole in you." He and his team opened fire on Havelock's position in the airlock, driving him back into cover.

Now that everyone wasn't looking at him, Basia took a moment to look over the mangled footing. "Naomi, I'm having the suit send you pictures of the damage."

"Basia, I—" she started.

"Help me fix this," he said, cutting her off. "If the *Barb* has more cable, I can reattach it here while Alex keeps us from totally losing our remaining connection."

"Basia," Naomi said, her voice gentle and sad. "This can't be fixed. The *Barbapiccola* is going down. Nothing is gained by her taking us with her."

"I do not accept that!" Basia shouted back at her, loud enough that his

own suit's speakers distorted. "There has to be a way!"

His suit flashed a warning at him, and he pulled back into cover just in time to avoid a fusillade of shots that bounced off the hull, leaving shiny streaks in the dull metal. One of the remaining nine attackers threw his arms up like he was surrendering, then went motionless, spinning slowly toward the *Barbapiccola*.

"Williams is flatlined," the chief engineer said. "You just killed an RCE employee. You'll burn for that, Havelock."

"You know what, chief? Fuck you," Havelock replied, his tone low, but real anger in his voice for the first time. "You are the one who escalated this. I didn't ask for any of it. Pull out. Marwick, get your men out of here! Don't let him force this anymore!"

Another voice, older, sadder, replied on the radio. "Those aren't my men, Mister Havelock. You know as well as I do that I have no authority over the expeditionary team."

"That's right, motherfucker," the chief said. "We're acting on orders from Chief of Security Murtry."

While Havelock, Marwick, and the chief engineer argued, Basia tuned them out. They'd either agree or they wouldn't. Havelock would kill more of them or he wouldn't. The captain would assert authority or he wouldn't. None of that changed Basia's real problem. His daughter was on board a ship that was slowly spinning out of control and losing altitude. At some point, it would hit enough atmosphere to get noticeable drag, which would slow it and let it fall deeper into the killing air, and shortly after that, it would burn up. The *Rocinante* couldn't save it. Helplessness and grief washed over him, but he willed himself not to weep. He wouldn't be able to see with the water sheeting across his eyes. There had to be another way.

"Basia," Naomi said on a private channel to him. He could tell she'd switched him to a private channel because the argument between Havelock and the RCE people stopped suddenly mid-word. "Basia, I'm getting your daughter out."

"What?"

"I'm on the line with the captain of the *Barbapiccola*. I've explained the situation. He's... well, he's not happy. But he understands. Alex promised you that if the ships went down, Felcia would be on the *Rocinante* when it happened. We're keeping that promise."

“How?” Basia asked. The way the ships were tumbling, he couldn’t imagine how dangerous a docking attempt would be. The ship-to-ship docking tubes were flexible, but not that flexible.

“They’re bringing her to the airlock now. They’ll put her in a suit and send her out to you. You’ll need to get her back to this ship and then... you need to cut the cable.”

Something about the docking tube stuck in his mind. The *Rocinante* couldn’t dock with the *Barbapiccola* to pull the doomed crew off, but a space suit was, at heart, just a bubble of air to keep its wearer alive.

“The docking tube,” he said. “Is there a way to seal it on both ends? We could put it on the *Barb*, seal it around some people, then move them across to the *Roci*.”

“We’d have to cut it free from the airlock housing,” Naomi said. A spray of bullets hit the cable footing as she spoke, like visual punctuation for her words. Another of the engineers spun away, his EVA pack holed in two places. Naomi continued talking but Basia wasn’t listening.

“What about emergency airlocks,” he said. “The plastic blister kind, you know? They’re made to hold atmosphere and supply oxygen.”

“You have to attach them to something,” Naomi said.

“What if,” Basia answered, “we attach them to each other? Seal to seal?”

Naomi was silent for a long moment. When she spoke again, her words were slow, measured. Like she was thinking them through as she spoke. “A life-support bubble.” Basia could tell she’d switched them back to the general channel because Havelock’s argument came thundering back. “Gentlemen, we have an idea. We’ll pull the crew off the *Barbapiccola* on escape pods made of two emergency airlocks sealed together. The *Roci* only carries one, but if the *Barb* has one—”

“You kidding me?” a new voice said. Basia recognized it. The captain of the Belter ship. “I think somebody turned ours into parts for a still back before we shot the pinche ring.”

“We have plenty of them,” Havelock said. “The *Israel* came out here with too much of everything. I’d bet we have twenty in storage.”

“That’s ten bubbles,” Basia said. “That’s plenty to hold the whole crew for a short trip.”

“Captain Marwick,” Koenen said, “you cannot give these people vital

RCE supplies.”

“Marwick,” Havelock said. “Do not let over a hundred innocent people die over this bullshit. Do not do that.”

“Ah fuck. What are they going to do? Cancel my contract?” Marwick replied, followed by a long sigh. “The *Israel* is moving in to transfer the escape bubbles. I’ll have the materials team start sealing them right now.”

“Captain,” the chief engineer growled, “we are acting out here on Security Chief Murtry’s direct orders to disable the squatters’ ship. You will not render them aid.”

“You,” Havelock said, “are such an asshole. Have you gone completely insane?”

“I will shoot down *any* attempt to—” the chief started, then stopped suddenly. The cable next to Basia snapped taut, almost tearing the few remaining attachments out of the *Barb*’s skin. Below, a rail gun shot streaked across Ilus, the fire from the defense moons stabbing at it as it fell. One of the red enemy dots on Basia’s HUD disappeared.

“Sorry,” Alex said, his accent as slow and heavy as Basia had ever heard it. “That was me. But that guy was pissin’ me off and I had the shot. Am I in trouble?”

There was a long moment of silence, and then Captain Marwick said, “*Israel*’s on her way.”

It took them nearly three hours to fabricate and then transfer the makeshift escape bubbles from the *Israel*. Basia kept track of the time by counting oxygen recharges for his suit. He flatly refused to return to the *Rocinante* until his daughter was off the dying Belter freighter. Alex had put some slack on the tether with carefully calculated bursts of thrust, and Basia had cut the line. No reason to keep the ships connected.

One by one the *Israel*’s expeditionary engineering team turned amateur militia contacted Havelock and apologized for how dramatically out of control the situation had gotten. Most of them blamed the chief engineer. Whether or not he was entirely responsible for the escalations that had occurred, Basia felt certain that history wouldn’t remember him kindly. One of the engineers admitted to being the person who’d fired the missile at the *Barbapiccola* and offered to help Basia fix the damage. Basia had offered to kill him if he tried. They agreed to disagree on it.

Even after the reconfigured emergency airlocks had been delivered, it

had taken the crew of the *Barbapiccola* and the colonists still on board two more hours to charge the air tanks and get everyone sealed inside. By that point, the computers on the *Rocinante* were saying the freighter should already be scraping upper atmosphere. The clock had run out.

But now Basia floated above the massive cargo bay doors of the *Barbapiccola*, waiting for them to open and set his daughter free.

It began as a line of white light cutting through the side of the massive freighter. Then, slowly, as the doors slid farther and farther apart, the ship's enormous cargo hold came into view. Against the backdrop of thousands of tons of raw lithium ore floated ten faintly translucent bubbles. Someone toggled a remote to open the cargo bay's airlock, and the air of the *Barbapiccola* rushed out, gently pushing the bubbles out the cargo bay door ahead of it.

The bubbles floated up away from the planet, the vacuum around them making them puff all the way up, little plump pockets of air for a dozen or more people to hide in, surrounded by the frozen mist of what had once been their ship's atmosphere. Ilus' star peeked around the limb of the planet, backlighting the bubbles and turning the floating people inside into black silhouettes, amazingly sharp against the blurry plastic walls. Like cardboard cutouts with a floodlight behind them.

Basia had a sudden memory of bathing Jacek in the kitchen sink when he was a baby, and his little boy farting in the water, a burst of small bubbles drifting up and then popping at the surface. The thought made him laugh until his stomach hurt. He recognized this was more about the relief that his daughter might live than it was about the flatulence of a small boy, but he laughed anyway.

"You okay out there?" Naomi asked.

"You ever bathed a kid in a sink?"

"Yeah," she said, "I have."

"They ever have gas?"

"I don't—" she started, then got it and laughed along with him.

Ten tow lines looped down from the open airlock of the *Israel*, and one by one Basia caught them and attached them to the bubbles. Felcia's bubble was last. As he pulled the strip at the end of the tether to activate the adhesive, he saw her look out of the airlock door's tiny transparent window. The sun had moved behind the planet, so Basia's visor had lost its opacity.

He activated the light inside the helmet so she'd be able to see him. Her face lit up, and the word *Papa* was so obvious on her lips that he would have sworn he could hear it.

"Hi, baby," he said, and put his gloved hand against the window. She put hers on the other side, small clever fingers against his big clumsy ones.

She smiled and pointed past him, mouthing the word "wow."

He turned to look. The *Israel* had started reeling the bubbles in one by one. A dozen humans being pulled through the vacuum of space inside an envelope of air barely larger than they were. When Felcia's line started to reel in, Basia kept his hand against it until it pulled gently, *gently* away from him. His little girl going up to safety. Temporary, sure, but all safety was.

In that moment, Basia felt something like a hammer blow to his chest. Everyone in those little pockets of air was a Felcia to someone. Every life saved there filled someone somewhere else with relief and joy. Every life snuffed out before its time was another Katoa. Someone, somewhere, having their heart torn out.

Basia could feel the detonator in his hands, the horrible click transferring to his palm as the button depressed. He could feel that terrible shock wave again as the landing pad vanished in fire. He could feel the horror replaced by fear as some unlucky combination of events put the shuttle too close to the blast and knocked it from the sky.

He could feel all of it so clearly it was as if it were happening right then. But more than that, he felt sorrow. Someone had just tried to do the same thing to his baby girl. Had tried to kill her, not because he hated her, but because she was standing in the path of his political statement. Everyone who died on that shuttle had been a Felcia to someone. And with the click of a button he'd killed them.

He hadn't meant to. He'd been trying to save them. That was the little lie he'd kept close to his heart for months now. But the truth was much worse. Some secret part of him *had* wanted the shuttle to die. Had reveled in watching it fall from the sky in flames. Had wanted to punish the people who were trying to take his world away.

Except that was a lie too.

The real truth, the truth beneath it all, was he'd wanted to spread his pain around. To punish the universe for being a place where his little boy

had been killed. To punish other people for being alive when his Katoa wasn't. That part of him had watched the shuttle burn and thought, *Now you know how it feels. Now you know how I feel.*

But the people he'd hurt had just saved his daughter because they were the kind of people who couldn't let even their enemies die helpless.

The first sob took him by surprise, nearly bending him double with its power. Then he was blind, his eyes filled with water, his throat closed like someone was choking him. He gasped for air and every gasp turned into another loud sob.

"Basia!" Naomi said in alarm. He'd just been cackling manically, and now he was sobbing. He must sound insane to her. "Basia, come back in!"

He tried to answer her, to reassure her, but when he spoke the only words he could say were, "I killed them."

"No," she said. "You saved them. You saved all of them."

"I killed them," he said again, and he meant the governor and Coop and Cate and the RCE security team, but most of all Katoa. He'd killed his little boy over and over again every time he'd let someone else die to punish them for his son's death. "I killed them," he said again.

"This time you saved them," Naomi repeated, as though she could read his mind. "These ones, you saved."

Havelock was waiting for him in the airlock. Basia knew the RCE man must have heard the breakdown he'd had. When Havelock looked at him, he felt nothing but shame. But while Havelock's face was tight with pain, there was no mockery in it when he gripped Basia's arm and said, "You did good out there."

Basia nodded back at him, not trusting himself to speak.

"Look," Havelock said, and pointed out the airlock door.

Basia turned around and saw the *Barbapiccola* leaving long thin streamers in its wake. It was entering Ilus' atmosphere. The front of the ship began to glow.

Havelock closed the hatch, but while the airlock cycled and they removed their gear, they watched the freighter's death on the wall monitor. Alex kept the *Roci's* scopes trained on it the entire time. It drifted for a

while, the streamers in the upper atmosphere eventually turning into white smoke with a black heart as the hull burned.

When the end came, it was sudden and shocking. The hull seemed to go from a solid object to many small fiery pieces in the blink of an eye, with no transition. Basia switched the monitor to the death clock to see how much time he'd bought Felcia.

Four days. The *Israel* had four days.

Chapter Fifty-Two: Elvi

Elvi sat in the darkness, her hand terminal in her lap. She was trembling, and the fear and the anger and the sorrow were like she'd walked back into the worst of the storm. She couldn't feel that now. She didn't have time. She needed to think.

The screen didn't have maps, of course. There wasn't a survey of any of this to draw from, and even if there was, she didn't have a connection to the *Israel*, if the *Israel* was still in orbit and hadn't fallen into the atmosphere and burned and killed everyone to death and—

She couldn't feel that now. She needed to think. The structure, ruins, whatever they were had to be at least seven or eight square kilometers. They'd entered the ruins near Holden's last live signal, but there was still a lot of territory to cover. The locator on the hand terminal screen showed only the local nodes. The other two were Fayez and Murtry, and they were grayed out. No line of sight, which was good because it meant that wherever Murtry was, he couldn't see her, and bad because she didn't know where he was. It was a low-level diagnostic. The kind that built ad hoc routing networks on the fly. She'd set it to ask for a renewed route anytime it made a connection and alert her when it did. It wasn't much, but it would give her a little warning when Murtry was close. When he had line of sight. When he could shoot her the way he had Amos and probably Fayez and they were dead now and she couldn't feel that. She had to think. How to find Holden. She had to find him. Warn him. Keep Murtry from stopping him. She took a deep breath and looked up. Line of sight was a hard thing to manage on the ground, but the space above her was vast and open. If she could find a vantage point, the hand terminal would point Murtry out to her.

And if she couldn't find her friend, at least she could locate her enemy. Basic problem solving. If you don't have the data you need, play with the data you have, see if something comes out of it. She'd made it through three semesters of combinatorics that way. All right.

Her body was still shaking. Still weak. Her mind felt fuzzy. Adrenaline and hunger and Faye was probably dead and she couldn't feel that. She stuffed the hand terminal in her pocket and looked around for a way up. Nothing here was built for a human form. There weren't any ladders or walkways, no catwalks with convenient handrails. It was like a vast body. Or a vast body that had turned halfway into a machine. She ran quietly, making as little noise as she could with every footfall. An upwelling of conduits rose from the floor to her right, and she clambered up them, wedging her feet and fists into the narrow spaces between the tubes and hauling up and up and up. There were so many other people who would have done better. Faye was stronger than she was. Sudyam used to climb mountains back on Earth. Elvi didn't particularly enjoy climbing trees, much less strange alien webworks. She went up, not looking back, not looking down.

The structure was vast, and the soft glow that permeated everything made the space seem strange. Dreamlike. She perched in the crevice where two conduits or arteries met, wedging her leg into the gap. She pulled out her hand terminal. Twice on her way up, the ad hoc network alert had sounded and she hadn't noticed. Twice, Murtry had been in line of sight. The thought made her throat feel tight. She looked at the reply times. Two thousandths of a second? That couldn't be right. Radio waves moved at light speed, but they were in air, so that made it... what? Three times ten to the eighth? Something like that. Close enough as to make no difference. That'd put him something like half a million meters away. There had to be some kind of processing lag in the terminals that was swamping...

A new entry popped into the log, and her heart lept to her throat. Connection refused. She blinked at it. Why would Murtry's terminal accept connections when she was climbing up and reject them when she'd paused? That didn't make sense. Another line. Connection refused. Something like hope bloomed in her. It wasn't Murtry. It was someone else. Someone who wasn't in the charmed circle of RCE trusted networks.

It was Holden.

She craned her neck, as if by just looking she could find him. The structure was too big. She thought of calling out, but there was no reason to think he'd hear. And even if he did, Murtry would be closer.

Murtry. There was a thought. She opened the hand terminal's routing interface again. It had been years since she'd played with network protocols. Most of what she did was about signaling proteins in cells and protein regulation. Her leg was starting to tingle where her weight pressed it into the tube. There was a way to get a copy of Murtry's logs too. She just had to remember how to set up distributed logging.

Something in the structure clanged, the echoes reverberating through the space like a scream in a cathedral. She wondered if Murtry looked up whether he would see the light of her screen, up here in her crow's nest. She waited. Waited. The alert sounded. Murtry connected. She closed her eyes. *Okay, she thought. Go away now. Just go away.*

The alert dropped, and she pulled up the logs, and Murtry's records were there now too, and one—one—line of them was a refused connection. It was like being in maths again. Posit a frightened exobiologist four meters off the ground and a violent, predatory security man in a direct line from her at points a, b, and c. At point d, the predator had a refused connection with a lag time just under two-tenths of a second because the goddam *fucking* processing lag was swamping the signal time and making the whole thing...

Only it would be the same lag, wouldn't it? So if she could pull out the difference...

The world fell away. Her fingers tapped the screen, shifting to the calculation displays, pulling numbers from the logs, setting up the diagrams. The fear and sorrow and raw, animal terror were all still there, but they were just messages and she could ignore them. Her leg started to hurt and then go numb. She shifted a few centimeters until it hurt again.

Holden had been a hundred and ten meters from her. He'd been a hundred and fifty meters from Murtry. She could estimate where Murtry had been based on the contacts he'd made with her. It was like basic trigonometry where a wrong answer meant death. Holden was—approximately, roughly, assuming she hadn't biffed the equations and that the hand terminal's processing lags were identical—in the complex junctions at the center right of the structure where the conduits joined

together into something like a massive black wing. Elvi turned off her hand terminal and started back down. When she reached a surface she could walk on, her leg screamed. Pins and needles. She ignored it and started limping as quickly as she could toward the landmark she'd found. She didn't care about Murtry now. She had something to focus on.

It was less like making her way through an industrial complex than tramping through a vast forest without a machete. She squeezed through the cracks between dark structures as much growth as machine, ducked and climbed and once got down on her belly and crawled. She was sure she was making progress, sure that she would get there and find out at least whether her figures had been right, when she stepped out across a flat ledge and almost fell into a chasm.

A rumbling came from below, maybe a hundred meters deep. A tiny band of lights shifted down there, swirling one way and then the other and then moving on. It cut through the floor of the structure to both sides, all the way to the distant walls. A network of conduits branched above it, and wide, tendonlike connections bridged it far below. She started off along the rim, stepping over white, lumpy growths that seemed to sprout up out of the depths. It only took a few minutes to find a structure that crossed it, but it wasn't a bridge.

It was mostly flat, though the edges sloped down into the void; its surface was a wire mesh over what looked like an endless length of tongue. There was nothing like guardrails, and when she stepped out onto it, the tongue reacted to her, twitching and undulating like it was trying to drag her along. She put her arms out for balance and trotted across the gap. Two meters, four meters, five, and she was on the other side. She leaned against the wall, her head between her hands until the dizziness faded. The vast winglike structure was almost directly above her now, only close up she could see that it was more complex. Thousands of interweaving growths with deep, interlocking spirals and a shifting movement whose source she couldn't identify.

She slipped down the far side of the ledge and into something more like a passageway than she'd seen since she fled into the dark. The passage shifted left and then right. She followed it, picking her way by guesswork and hope. The ratio of floor to wall to ceiling unnerved her for reasons she couldn't quite say. Tiny flickers of blue light like fireflies glowed and went

dark all around her. She followed a broad turn and it opened into a chamber. She screamed.

Holden was there not three meters away, a huge, insectile thing looming above him. Cruel claws reached out and spikes like daggers caught the dim and eerie light. She pressed her knuckles to her mouth, unable to look away from Holden's last moments.

The artifact shifted toward her, paused, and lifted a claw like it was waving. Holden followed the gesture.

"Elvi?" he said. "What are you doing here?"

"I was... We were..." She sank down to her knees, relief running through her like water. She took a deep breath and tried again. "Murtry took one of the carts when you disappeared. He followed the signal from your hand terminal. He knows you're trying to shut down all the artifacts." A stab of panic took her and she glanced at the clawed thing.

"That's all right, kid," the robot-thing said in a tinny Belter accent. "It ain't news to me."

"Amos and Fayez and I got another cart going, and we came after them. To warn you."

"Okay," Holden said. "You did great. We're going to be fine now. How did you find us?"

Elvi held up her hand terminal, took a breath, let it out. "It was complicated."

"Fair enough. What about Amos? Where's he?"

"Murtry shot him. I think he's dead."

Holden's face went pale and then flushed. He shook his head, and when he spoke, his voice was low and careful. "Amos isn't dead."

"How do you know?"

"If Amos goes down, it's because literally everyone else there has already died. We're still alive, so Amos is too."

"Don't pay too much attention to him," the robot monster said. "He gets a little romantic about these things. If you say the bald guy's dead, I believe you."

"Thank you," Elvi said by reflex.

"I am sorry about it, though. I liked him."

"I did too," Elvi said. "And Fayez. I heard gunshots when I was running. I think Fayez—"

“How about Murtry?” Holden asked.

“He’s coming. He’s behind me. I don’t know how far. But he’s coming to find you. To stop you.”

“Why the fuck would he stop me?” Holden asked, biting the words.

“He wants RCE to have the artifacts still working.”

“That man’s kind of an asshole,” the alien said. “We’ve got a pretty full plate, though. We’re close.”

“Close to what?” Elvi said.

“That would be the question,” the alien answered, but Holden’s gaze was fixed over her shoulder. His jaw was tight and angry.

“All right,” he said. “We’ve got two things we need to do.”

“We do?” the alien said. It occurred to Elvi that they were talking to an alien. She thought that was remarkable, and she was a little confused that Holden hadn’t remarked on it.

“Someone has to find this whatever-it-is and shut off the planetary defenses, and someone has to shoot Murtry.”

“Not to disagree with you,” the alien said, shifting its weight on six articulated legs. “One of those seems a little more important to me.”

“Me too,” Holden said, “but I don’t think it’s the same one. Elvi, I’m going to need you to go save everyone, okay?”

“Um,” she said. “All right?”

“Good. This is Detective Miller. He died when Eros hit Venus and now he’s a puppet of the protomolecule.”

“Semi-autonomous,” the alien said.

“Pleased to meet you.”

“Likewise.”

“Okay,” Holden said. “I’m going to go take care of this.”

To Elvi’s surprise and unease, Holden walked away, following the passage she’d taken. The alien thing cleared its throat apologetically, only she was fairly sure it didn’t have a throat. So the sound was just a kind of conversational inflection.

“Sorry about that,” the alien—Miller—said. “He gets an idea in his head sometimes and there’s no talking to him.”

“It’s all right,” Elvi said. “So... um.”

“Right, saving everyone in the world. Follow me, kid. I’ll get you up to speed.”

“So it’s a distributed consciousness,” she said, following Miller through a low archway. She felt lightheaded, and not just from hunger. Faye was dead. Amos was dead. She was going to die. She was on an alien world. She was talking to a dead man wearing an alien robot. The part of her that could feel things was done, shut off. Her heart was a numbness behind her ribs, and when—if—it came back, she couldn’t guess who or what she would be.

“Except it’s not exactly conscious,” Miller said. “There’s nodes in it that are, but they don’t run the joint. I’m not actually one of them. I’m a construct based on the dead guy, only I’m based really closely on him, and he was kind of a bulldog about this kind of thing. At least by the end he was.”

“So are *you* conscious?”

The alien robot—the skin the Miller construct was using—shrugged. It was strange how well the gesture translated. “Don’t know. Seems like I’m acing my Turing test, though.”

Elvi thought about it and nodded. “Fair enough.”

“So I sort of... well, triangulated where the dead spot was in space. If you see what I mean.”

“Sure, yes. Triangulation. I totally understand that,” Elvi said. “So. Four now.”

“Four?”

“Our biosphere, the local organisms, the things that made the gates, and the things that killed them. Four.”

Miller stopped at a seam in the wall and placed his claws on it, ready to push. “In through here? It used to be one of the major control centers for the planet. Like a... like a nerve cluster or something. As near as I can figure it, the dead spot’s in here.”

He pushed. The wall retracted, not sliding back so much as changing conformation. Beyond it, a wide, tall space opened. Hundreds of niches rose, level after level, one above the other, with mechanisms like Miller in each of them. Dots of bright blue light like fireflies swirled spiral patterns in the air, riding currents of air that Elvi couldn’t feel. And in the center,

floating a meter above the floor, was...

She looked away, putting her hand on Miller's side to steady herself, then forced her gaze back up. It was hard to look at directly. The margins of the space were bright without illuminating anything or casting shadows, sharp and terrible. It reminded her of the way schizophrenics and people suffering migraines would describe light as assaulting and dangerous. And within that boundary, darkness swirled. It was more than an absence. She could sense a structure within it, layers interpenetrating, like shadows casting shadows. It throbbed with an inhuman power, tidal and deep and painful. *Look at this too long*, Elvi thought, *and I will lose my mind in it*. She took a step toward it, feeling the structures in the blackness respond to her. She felt as if she could see the spaces between molecules in the air, like atoms themselves had become a thin fog, and for the first time she could see the true shape of reality looming up just beyond her reach.

Once, there had been a civilization here beyond anything Elvi had ever imagined. Beings that could design tools like the protomolecule, like the rings. They had peopled a thousand worlds, and more, spread through time and through space, and they were gone now. And this—she had no doubt at all—this was the footprint of the thing that had killed them.

"So," Miller said, moving his claws in a wide, spreading gesture, "you need to look for anything, you know, odd. Something that doesn't seem like it fits."

She turned to him, confused, and pointed at the uncanny thing in the center of the room. "You mean like that?"

Miller shifted, alien eyes moving their lenses in the complexity of the mechanism. "Like what?"

"That. In the middle of the room. That."

"I don't see anything," Miller said. "What's it look like?"

"The eye of an angry God?" Elvi said.

"Oh," Miller said. The heavy plates of his robotic body clicked and hissed against each other as he shifted. "Yeah, well that's probably it, then. Good work."

Chapter Fifty-Three: Holden

When Murtry pulled himself through a gap in the machinery and walked across the ledge to the narrow bridge, Holden was waiting for him on the other side. His hand was draped casually on the butt of his gun. The RCE security chief gave Holden a vague nod, then carefully examined his surroundings. He looked down into the hundred-meter chasm, and tapped the narrow tonguelike bridge with the tip of one boot. He spun once slowly, peering carefully into the crevices created by the cramped machines. When he was through, he looked at Holden again and gave him a flat, meaningless smile. Holden noticed his hand wasn't far from his own weapon.

You came by yourself," Murtry said. "The better plan is to put one person in the open with a second hidden behind the target."

"That the one you use?" Holden asked. He tried to match Murtry's casual nonchalance and felt like he mostly succeeded.

"It works," Murtry replied with a nod. "So how does this go down?"

"I've been wondering that myself."

"Well," Murtry said with an almost imperceptible shrug, "I need to get over there and stop whatever you people are cooking up. Doctor Okoye seems to think you are going to break the defense network down."

"Yeah," Holden replied. "Pretty much am. Call it saving people."

Murtry nodded but didn't speak for a moment. Holden waited for him to reach for his gun. The distance between them, the width of the chasm, was just over five meters. An easy shot at the range. Harder when you were rushing because the other guy was shooting back. The lighting was good and Murtry wasn't wearing a helmet. Risk the head shot? The RCE man's armor looked pretty chewed up. The blast patterns on it made Holden

suspect that was the work of Amos' autoshotgun. The chest shot was easier, but it was possible the damage to the armor was mostly cosmetic, in which case his sidearm wasn't going to do much.

Murtry winked at him, and Holden suddenly felt like the man was reading his mind as he calculated the best way to kill him. "I can't let that happen," Murtry said. His shrug was almost apologetic. "By charter, this all belongs to RCE. You don't get to break it."

Holden shook his head in disbelief. "You really are crazy. If I don't break it, our ships fall out of the sky and we all die."

"Maybe. Maybe we die. Maybe we find some other way to stay alive. Either way, the RCE claim remains in force." Murtry waved one hand, not his gun hand, around the room. "All this is worth trillions intact. We've made incredible advances in materials science just by *looking* at the rings. How much will working technology do for us? This is what we came here for, Captain. You don't get to decide what we do with it."

"Trillions," Holden said, unable to keep the disbelief out of his voice. "I've never seen a dead person spend money."

"Sure you have. They call it a foundation or a bequest. Happens all the time."

"This is all so you can make a bequest?"

Murtry's smile widened a millimeter.

"No," he said. "I came to conquer a new world. *This* is how you do that. I understand what I'm doing seems cruel and inflexible to you, but it's what this situation requires. The tools you're using here are the ones that let you get along once civilization takes over. They're the wrong shape for this work. I have no illusions about what it will take to carve out a place in this new frontier. It will take sacrifices, and it will take blood, and things we wouldn't do back where everything's regulated and controlled will have to happen here. You think we can do it with committee meetings and press releases."

"I wonder if this will sound like a compelling argument to the people dying in orbit right now."

"I'm sorry for them. I truly am. But they knew the risks when they got on board. And their deaths will have meaning," Murtry said.

"Meaning?"

"They are the sign that we didn't give up a centimeter. What we came

for, we held to the last gasp. This isn't something humanity can do halfway, Captain. It never has been. Even Cortez burned his ships."

Holden's laugh was half disbelief and half contempt. "What is it with you guys and worshipping mass murderers?"

Murtry frowned. A swirl of bright blue lights rose and fell between them like dust blowing down a desert street.

"How do you mean?" Murtry asked.

"A guy I once knew tried to justify his life choices to me by comparing himself to Genghis Khan."

"I take it you didn't find his argument compelling?" Murtry asked with a smirk.

"No," Holden said. "And then a friend of mine shot him in the face."

"An ironic rebuttal to an argument about necessary violence."

"I thought so too, at the time."

Murtry reached up and scratched his head with his left hand, his short greasy hair shifting into a configuration vaguely resembling Miller's carapace. A sculpture of curves and spikes. He looked at his fingertips in disgust and wiped them on his armor. Holden waited. Somewhere far behind them, a strange chittering sound rose like cicadas on a summer afternoon.

"So," Murtry finally said. "I'm going to need to come over there." He gestured at Holden's side of the chasm with his chin. His right hand still hovered over his gun.

"Nope," Holden replied.

Murtry nodded, as if expecting this. "You going to arrest me, Sheriff?"

"Actually, I was kind of thinking I'd shoot you."

"In the face, no doubt."

"If that's what I can hit."

"Seems like a radical shift," Murtry said, "for a man who wants to tame the frontier with mediation and committee meetings."

"Oh, no, this isn't about that. Elvi says you killed Amos. I wouldn't kill a single person for your fucking frontier, but for my crew? Yeah, I'll kill you for that."

"They say revenge is empty."

"This is my first try at it," Holden said. "Forgive me if my opinions on it are fairly unformed."

“Will it change things if your boy isn’t dead? He was still shooting when I left him.”

The wave of relief that hit Holden at this almost doubled him over. If Murtry had pulled his pistol and shot at that moment the fight would have been over. But he managed to keep his face blank and his knees from buckling.

“Is he hurt?”

“Oh my, yes. Pretty badly. He killed one of mine before he went down. For a guy who wants to solve problems without violence, you travel in dangerous company.”

“Yeah,” Holden said, unable to keep the smile off his face. “But he’s a great mechanic. What about the other one? Fayez?”

“Down, not dead. I didn’t get to finish him before your boy started blazing away. Neither one was walking, so I just left.”

The matter-of-fact discussion of why Murtry hadn’t just killed Fayez chilled Holden’s blood.

“So here’s a deal,” Murtry said. “I let you cross to this side and you can go check on your man Amos. Save the egghead from bleeding out, too. You have my word I won’t interfere.”

“But,” Holden replied, “you head over to my side and stop Elvi from doing what I need her to do.”

“Seems a fair trade.”

Holden stopped just resting his hand on the butt of his pistol and wrapped it around the grip. He turned his body, getting his feet in position. Murtry gave him just the hint of a frown.

“No,” Holden said, and waited for the shooting to start.

“So,” Murtry said, not moving at all. “You know what people always forget about the new world?”

Holden didn’t answer.

“Civilization has a built-in lag time. Just like light delay. We fly out here to this new place, and because we’re civilized, we think civilization comes with us. It doesn’t. We build it. And while we’re building it, a whole lot of people die. You think the American west came with railroads and post offices and jails? Those things were built, and at the cost of thousands of lives. They were built on the corpses of everyone who was there before the Spanish came. You don’t get one without the other. And it’s people like me

that do it. People like you come later. All of this?" Murtry waved his left hand at himself and Holden. "This is because you showed up too early. Come back after I've built a post office and we'll talk."

"You done?" Holden asked.

"So this is our day, I take it," Murtry said. "No way but this way? Even if I didn't kill your man?"

"Maybe you killed Amos and Fayez and maybe you didn't. Maybe you're right about the frontier and I'm just a naïve idiot. Maybe every single person you killed on this world had it coming and you were always in the right."

"But you have people in orbit and saving them is all that counts?"

"I was going to say, 'But you're a flaming asshole,' " Holden said. "But the other works too. You don't cross this bridge."

"Well then," Murtry said. He shifted his stance and his eyes narrowed. The chittering grew louder. Below them, the protomolecule fireflies swirled and shuddered. "Well then."

Holden smiled at him. Mimicking Alex's drawl he said, "Come on, Black Bart, you always knew it would end this way."

Murtry laughed. "You're a funny—"

Holden shot him.

Murtry staggered, clutching at his chest and fumbling for his gun. Holden put his second shot into the man's right arm. He tried for the elbow and only managed to get the bicep. Just as good. Murtry dropped the gun onto the bridge in front of him. When the RCE man went to one knee to try and pick it up with his left hand, Holden shot him in the leg. Murtry pitched forward onto the bridge, sending the gun tumbling away into the abyss. Murtry slid to the side, going over the edge, but managed to throw his left arm onto the metal mesh and stop his fall.

The whole thing had taken about three seconds.

As the last echoing report of the gunshot faded, Holden walked out onto the bridge. The uncanny musculature pressed at the soles of his feet. Murtry clung to the mesh with his one good hand, his face tight with pain, but still managing a mocking grin.

"You got the balls to finish this, boy?" he said. "Or are you going to let gravity do it?"

"Oh, no," Holden said, then knelt down to grab Murtry's left wrist and

haul him toward the ledge. "I'm not killing you. At least not until I'm sure about Amos."

Holden stepped off the bridge onto Murtry's side of the chasm and pulled the RCE man until his torso was up over the edge. Murtry scrambled the rest of the way up with his one good arm.

"Then what?" he gasped out, lying on his back next to the pit and trying to catch his breath. A small pool of blood was forming under his right arm and left leg.

"I take you back," Holden said, sitting down next to Murtry and patting him companionably on the head. "And I burn you down in public, with news coverage of the entire thing. Then we throw you in a hole so deep everyone forgets you ever existed. No fame and glory for you, Cortez. Montezuma wasn't impressed by your fire stick this time."

"Everything I did was within the bounds of the UN charter," Murtry said. "I acted responsibly to protect the employees and investments of Royal Charter Energy."

"Okay," Holden said, then pulled out his medkit and sprayed bandages onto Murtry's two bleeding injuries. "So you've got your defense strategy mapped out. That's proactive thinking. Lawyers'll be happy to hear it. Wanna hear mine?"

"Sure," Murtry said, and probed at the wound on his arm. He grimaced, but no blood squirted out.

"The most powerful person on earth owes me a favor, and I'm going to tell her you're an asshole who tried his best to make her look bad. It's just a sketch of a plan at this point, but I think it has potential."

"That's what passes for justice with you?"

"Apparently so."

Murtry opened his mouth, but whatever he was about to say was lost when the factory exploded into chaos. A wall of blue fireflies shot up from the chasm next to them, and then streaked across the cavernous factory space to disappear into small vents in the walls. All around, the cacophony of massive machines coming to life filled the air. Something flew out of the shadows by the ceiling and swooped low over Holden's head. He threw himself across Murtry, not unaware of the irony in using his own body to shield a man he'd just shot three times.

"What is it?" Murtry said.

“Elvi,” Holden replied. “It’s Elvi.”

OceanofPDF.com

Chapter Fifty-Four: Elvi

Yeah,” Miller said, sounding satisfied. “I’ve got a plan, but I’m going to need your help. I need to get as close to that whatever-the-hell-it-is as I can. You can see it, I can’t. So this one’s on you.”

All right,” she said. “What... what are you going to do?”

The robot shrugged. “Every time we... I... well, you get it. Every time anything reaches into this, it dies. This thing takes down networks like the one I am. I’m going to get connected to as much of the crap on this planet as I can and escort it all into, y’know. That. Take it down. Break the system.”

“Won’t that shut you down too?”

“I think so. That’s the thing about using complicated tools. Sometimes the features you’re looking for come with a whole lot of baggage.”

“I don’t understand,” Elvi said.

“It built me to find something that’s missing,” Miller said. “Turns out I’m also a good tool for dying when that’s the right solve. Seriously, I’ve got practice with this. So come over here and get me as close as you can to the whatever-it-is. I don’t want to touch it, though. I slip in before I’m hooked up to everything else, and I’m pretty sure you’re just boned.”

“All right,” Elvi said, shifting until she could see the robot and the darkness both. “Turn about thirty degrees to your left.”

The robot shifted with the speed and sharpness of a startled insect.

“The boundary’s about half a meter in front of you. Why do you need to be close to it?”

“Well, the thing I’m part of? It may not be conscious, but it’s not stupid. When I do this, pretty much all the tools its got are going to know what I

know, and they may not take a forced shutdown well. Whatever else this thing was designed to do, it likes still existing until it finishes its job. It's a survivor. I'm pretty much the opposite of that."

She thought she heard a smile in the thing's voice. Where had that come from? The patterns and habits in a dead man's brain? Or was that fatalism another good move in design space? Did the universe evolve eyes and wings and sense organs and bitter amusement at the prospect of death all the same way?

"Okay," Miller said. The robot shifted, hunkered down, prepared to spring forward. "We're going in three. Two. *One*."

The impact was like being in the heavy shuttle again as it crashed. Elvi's world contracted to a small space inside her own skull, and then slowly bloomed out again in pain. She struggled to sit up, trying to see straight. Trying to think. Had Miller exploded? Was she dead? The cacophony of shrieking metal and violence made it hard to get her bearings.

She was against the wall. All around her, mechanisms were crawling down from their niches. Many of them were failing—legs scraping at the walls without the strength to pull themselves forward or landing on the ground only to crawl in a panicked, spasmodic circle like insects dying from poison. The air was thick with the mindless chittering of their joints. Three massive machines had pinned the Miller-robot and were pounding it while Miller's voice shouted *shitshitshitshit*. One of the attackers caught Miller's claw and pulled, ripping the appendage off in a shower of sparks and bright fluids. He wasn't going to make it. There was no way.

A small winged machine with a bright blue margin on the knifelike edge where a beak would be swooped down from above, passed through the darkness, and fell clattering and rolling to the ground. Elvi ran to it, picked it up. It was light enough to carry, as long as her forearm, and sharp at the front. With a howl, she charged the machines that were piling on Miller. The impact stung her fingers. Something struck her across the back, and the world narrowed again, but she lashed out with what strength she still had.

One of the huge machines turned from Miller toward her, its claws splaying out three meters to either side. She jumped back, fell, scuttled. The pulsing, malefic blackness of the dead spot was on her left, and she crawled around it, trying to keep it between her and the massive attacker.

The robot skittered toward her, its claws swinging like scythes until it

reached the margin of the blackness and crumpled down dead. Inertia rolled its corpse across the floor, legs and claws flopping and limp. The chittering in the room paused. The attention of the artifacts turned toward her. She put her foot on the fallen monster, lifted her fists, and howled. Miller twisted, driving his remaining claw up and through the body of one of the two machines that were still at his side. The chittering began again, even more overwhelming than before. The sound itself felt like an attack, battering at her ears, robbing her of her balance.

She was in the center of an invisible waterfall, a thunderstorm, a tempest. Adrenaline more than conscious will lifted her up over the body of her fallen enemy, and she skirted around the dead spot. Another machine fell from a higher niche, smashing itself on the ground before her. She stepped over it as it writhed. The last remaining fully functional attacker swung at Miller, the blades of its claws plunging deep into Miller's carapace. As Elvi came close, it tried to turn toward her. The claw still inside Miller bound with a deep creaking sound. Miller's remaining claw fastened on the other robot's wrist, holding the attacker's claw close, pulling it in, deeper. A viscous fluid poured out of Miller, filling the air with the stink of petroleum and acid. Elvi scooped a length of fallen robot's leg and slammed it into Miller's assailant, striking sparks. The blows had no effect other than to confuse the thing. She could no more have injured it than she could will herself to fly up into the air and lift the falling ships by force of will. But the moment's hesitation was enough.

Miller pulled himself under the remaining attacker, on his back. Four of the six articulated legs started digging at the robot's undercarriage. Belly. She didn't have a good model for this. The unencumbered claw smashed down, knocking shards of metal from Miller's side, but with Miller mostly underneath the attacker, it couldn't get an angle that would let it deliver a killing blow.

A thin-limbed, spindly robot skittered through the opened wall, sprinting toward the battle. Elvi grabbed it as it passed and knocked it into the dead spot. Bits of plating began to peel off the attacking thing's belly, and Miller burrowed up into it. The filthy and stinking ichor started pouring out in a flood. It was an ugly death, slow and violent and unpoetic. When the attacker had stopped moving, Elvi came close. The dead robot was on top of Miller. The pool of thin liquid all around stung her eyes with its fumes.

“Well, that could have gone better,” Miller said.

“Did it work? Are you connected?”

“Yeah,” Miller said. “Not sure how much good that’s going to do. There’s another wave of these things coming, and I’m not seeing how I get from here to there.”

Elvi put her shoulder under the dead robot, pushing as hard as she could. The tendons in her neck ached. She imagined she could hear them creaking. She put everything she had into the effort. There was nothing to hold back for. No later that mattered. Keeping anything in reserve was a waste of resources because there was no future left. She screamed with the sheer physical effort.

The robot didn’t even shift.

She fell to her knees. With a groan, Miller put his claw out, resting it gently on her arm. When he spoke, his voice sounded distant, muffled. Words from a grave.

“Okay, this is going to be tricky,” he said. “I’m going to need one more favor from you, kid. And we don’t have much time before they get here.”

“Yes,” she said. “Whatever.”

“Okay, stand back a little. I’m popping the seals on this thing.”

She slid backward, the slime on the floor flowing up to the ankles of her pants. There was a hiss like steam escaping from a holed line, a deep, meaty click, and Miller came apart, the plating and scales of his body collapsing. The thing on top of him rolled away and lay dead on its side.

Elvi stood over Miller’s corpse. It looked like nothing so much as a huge insect smashed under a giant’s heel. The chittering all around her rose to a shriek.

“What do I do?” Elvi shouted. “What am I supposed to do?”

Miller’s voice came from deep inside the mess. “There’s a unit in here. It’s about a meter long, bright blue, and there’s a row of seven... no, eight dots along the side. I need you to dig it out.”

Elvi stepped forward. The plating was all knifepoints and sharp edges. She felt the sting where it cut her palms, and the burning where the robotic fluids flowed into the wounds.

“I don’t mean to be that guy,” Miller said. “But you also need to hurry.”

“Trying,” she said.

“Just saying there are more bad guys and they’re getting a little closer

than I like.”

“All right. I have it,” Elvi said. “It’s right here.”

“Good. Nice work. Now I need you to pick that up and walk it into the dead spot.”

The blue thing was the shape of a huge elongated almond. The surface was slick and soft. She put her hands around it, strained, grunted, and slid forward, panting. “You have got to be kidding me,” she said.

“It may be a little heavy,” Miller said.

“It’s like ninety kilos.”

“And I’m really sorry about that, but we need to get it into that dead spot now. Try sliding your arms under it and lifting with your back and legs. Just like it was a baby.”

“Baby made from fucking tungsten,” Elvi muttered.

“You’re exaggerating,” he said as she shoved her hands under the thing.

“I can’t throw this,” she said. “I have to walk it in.”

“All right.”

“Is that thing going to kill me if I go into it?”

A new sound rose behind the chittering. A deep booming sound like a massive drum. She didn’t want to think of what might be making it.

“If I say yes, does that mean you won’t do it?”

Elvi braced herself, straining her back. The blue thing shifted up into her lap. She bent her head, trying to catch her breath.

“No,” she said, surprised at the answer even as she spoke it. “I’ll still do it.”

“Maybe, then. I don’t know.”

Elvi rocked back, keeping the thing—Miller—on her thighs and still getting her feet under her. She felt it start to slide to her left. If she dropped it now, she didn’t think she’d be able to get it up again. The booming came closer. Elvi pushed with her legs. Her knees ached. Her back was a single, vast sheet of burning. She pressed the blue thing to her chest, crying out from the pain.

“You’re doing great, kid. You’re doing great. You can do this. Just a little more. But do it *now*.”

She didn’t step forward. Just slid one foot a little ahead, shifted her weight, pulled the other foot in. The floor was slick as ice. Not quite frictionless, but close. The booming came again, near enough that she felt

the room vibrate with it. She set her gaze on the blackness of the dead spot and moved forward. Another step. Another. Another. She was close now. Her back was on fire. Her arms were numb. Her fists something that belonged to someone else, and only happened to be connected to her.

A swarm of silver and blue gushed in the doorway, flowing in at her like a cloud of flies. Elvi pushed, slipped, fell forward—

The closest analogy, the one her brain reached for and rejected and reached for again, was splashing into a lake. It was cold, but not cold. There was a smell, rich and loamy. The smell of growth and decay. She was aware of her body, the skin, the sinew, the curl of her gut. She was aware of the nerves that were firing in her brain as she became aware of the nerves firing in her brain. She unmade herself and watched herself being unmade. All the bacteria on her skin and in her blood, the virii in her tissues. The woman who had been Elvi Okoye became a landscape. A world. She fell farther in.

Cells became molecules—countless and complex and varied. The demarcation of one thing and another failed. There was only a community of molecules, shifting in a vast dance. And then the atoms that made the molecules gave up their space, and she was a breath. A mist. A tiny play of fields and interactions in a vacuum as perfect as space. She was a vibration in nothingness.

She rolled onto her side. Something hurt. Everything hurt, and the pain was interesting. A subject of curiosity more than distress. She was breathing. She could feel the air moving through her throat and into the complex network of soft caverns behind her ribs. It was a strange and beautiful sensation. She stayed with it until she began to realize that time existed. That moments were passing. That meant basal ganglia and cerebellum and cerebral cortex were all actually starting to work. She felt distantly surprised about that. She opened her eyes to nothing.

She was holding something pressed to her like it was precious. The blue thing. Miller. Only it wasn't blue anymore. It was the closed-eyes blackness of everything else. She let it go and sat up. The world was silent. No booming. No chittering. Her breath. The hush of her blood. After a few moments, she drew her hand terminal out of her pocket and turned up the screen brightness, using it like a lamp.

All around her, the artifacts of New Terra lay dead. Knife-sharp legs were still. Vast, inhuman claws that could have been carved from stone. A

spray of silver flecks on the ground showed where the cloud of tiny mechanisms had fallen, a million tiny bodies turned off at once. The light was too dim for colors. Everything was only gray.

She sat up and turned reluctantly to the side. It was there. Black and bright at the margins. She felt a stab of almost supernatural fear. She'd thought—hoped—it would be gone. Whatever it was, she had passed through it, been ripped apart by it, and still been simple enough to reassemble herself on the other side. It had saved her, and she had never seen anything in her life that filled her with a deeper dread than that complex darkness.

She moved back, her legs aching. She stood. She was aware that she was weeping without knowing why exactly she was doing it. Hunger and fear and relief and exultation and mortal fear. It was too much. That was fine.

The voice that came to her was human and distant. Was Holden.

“Elvi? Elvi! Are you there?”

“I’m here,” she shouted.

“Did we win?”

She took one long breath. Then another.

“Yes,” she called. “We won.”

Interlude: The Investigator

—it reaches out it reaches out it reaches out it reaches out—

One hundred and thirteen times a second, it reaches out to report that the work is done. If something accepted the report, it could stop. It will never stop. It feels no frustration and no fear. It feels the investigator moving within it and around it. The investigator exceeds its boundary conditions. It tries to kill the investigator. It fails. It feels no distress at the failure, and it reaches out, it reaches out, it reaches out—

The investigator looks into the eye of death, and can't see it. It knows, and that is enough. It feels pleasure and regret because they are part of the template. It says a name—Julie. It remembers taking a woman's hand in its own.

The investigator reaches out, reaches down. It broadens like an eternal, endless inhalation, and spreads to fill all the places that it can reach, that have been reached. That are. It reaches out it reaches out it reaches out, the ticking on an insectile leg, a spark closing a gap, endlessly, and the investigator feels it, encompasses it. The scars reach out, the other minds. Some are frightened, some are lost in dreams that have been going on for years, some are grateful. They sing to the investigator, or they accuse it, or they plead with it, or they scream. They are aware, and powerless as they have ever been. The investigator touches them as it touches everything. It tells them not to worry. That it's driving this bus.

Don't worry, it says. We're gonna be fine.

The investigator pushes his hat back, wishes he had a beer. He likes this woman. This Elvi. He wishes he'd had a little more time to know her. He wishes he had a little more time. He doesn't care. He has died a million times since he died. The void has no mysteries for him now.

He connects, and the investigator becomes the world. He feels it everywhere. The orbital bases, the power cores in the crushing depth of the ocean, the library vaults where the old ones had lived, the signaling stations high in the mountains, the cities deep beneath the ground. He is the world.

There is a struggle at the end. There's always a struggle at the end. He's not scared, and so all through the world, the others aren't either. *You're like Peter Pan*, she says. *When a child died, Peter Pan would fall halfway with them. So they wouldn't be scared.*

Weird. And that's a kid's story? Anyway, it's not me, the investigator says, smiles at her. Holds her hand. *I don't go for half.*

—it reaches out and it reaches out and it reaches out and then it stops.

Chapter Fifty-Five: Havelock

Blue. That was what he forgot every time. He knew it intellectually, sure. Sky-blue sky, after all, but spend a few years on a station or a ship and it was one of those details that slipped away. He didn't even know he'd forgotten it until he had a moment like this. He leaned on his cane and lifted a hand to shade his eyes and looked up past the green-gray clouds to the wider blue sky.

It's pretty, isn't it?" the woman asked. Lucia, her name was. First Landing's physician, Basia's wife, Felcia and Jacek's mother. "Makes you want to stay."

"No," he said. "Makes me want to be home already."

"If you lived here..." she said.

"Not a chance," he replied, and chuckled.

The *Rocinante* sat on the muddy ground behind him, more or less where the landing pad had been back when there had been a landing pad. All of that was gone now. The scientific huts, the buildings of First Landing, even most of the mining operation. Everything had been scraped flat and clean. Only the erosion ditches showed where the flood had been now that the waters had gone.

The *Roci*'s cargo bays were open. Men and women were hauling formed plastic boxes of supplies and equipment out and stacking them on the soft ground. He saw Naomi in a lift suit directing them, calling out information, coordinating the responses. Alex and Basia stood on a thin scaffold they'd erected against the side of the ship with the other one—Amos Burton, he thought the name was—surveying the damage and planning out what repairs they could manage in humanity's most primitive and ill-equipped

dry dock. The big bald man's right hand was locked in a medical casing, and his frustration with it showed in the way he moved his arms and held his shoulders.

"Are you ready?" Lucia asked.

"If you'd like," Havelock said. "Sure."

They walked together to the first pile of crates. Havelock took out his hand terminal, and Lucia took out one of the ones they'd dropped before. It was hers now. They started marking off boxes from the lading bills, recording carefully what help was being delivered and being accepted.

He was supposed to have died three weeks before. His body should have been a stream of ionized atoms and complex molecules floating somewhere in Ilus' upper atmosphere. The *Israel* should have been dead before him.

He'd been in the medical bay when it happened, doped by the autodoc and having half a liter of artificial blood shoved into his veins. He could still remember the feeling of the restraints holding him to the medical couch, the soft ticking of the expert system's tool arm, the cold feeling of fluid coming into his body. His lips and tongue had felt cold and tingled, but Alex assured him that was normal. Basia had come in, eaten, and gone out again to clean up the last remnants of the tether that were still clinging to the *Rocinante*'s belly.

He'd said something about how it seemed kind of a pointless exercise.

"He's that kind of guy, I guess," Alex said. "Doesn't like to leave things half done."

"Belter."

"Yeah," Alex agreed. "They're all kind of like that."

Alex's hand terminal chimed, and the pilot frowned at it. "Cap? That you?"

The voice that came from the speaker was recognizable James Holden, but he sounded rougher. Like he'd been shouting a lot. "Alex! Turn on the reactor."

"Not sure I can do that, Cap," Alex said.

"We killed the defense grid. I think we killed everything. See if you can get the reactor on."

Alex's expression went very still, very sober. The gallows humor was gone, the brave mask that had covered the fear of death vanished. Havelock understood, because he felt the same rush of hope and also of fear that the hope would be disappointed. Without a word, Alex pulled himself to one of the medical bay's computers and shifted it to engine controls. Havelock squeezed his fists until they ached and fought not to interrupt Alex by asking if it was working.

"Is it working?"

"I think... it is," Alex said, then turned to the hand terminal. "I'm getting power, Cap. The diagnostics are throwing some errors, but I'm pretty sure that's just 'cause we got shook up a little. I'll put Naomi and Basia on it, and I'll bet we can get up to functional. It'd help a lot if we had Amos, though."

"Amos is a little shook up too," Holden said, and Havelock could hear the grin in his voice.

"He all right?"

"He's gonna need to grow some new fingers."

Alex shrugged. "We can do that. Um. Give me a couple days, I might be able to bring the *Roci* down to the surface. Get him into the med bay."

"Don't hurry," Holden said. "Take your time, make sure everything's working. We can't take another crisis."

"There's always going to be another crisis, Cap. That's just how it goes."

"Let's just put it off until we've recovered from the last one, all right? Can you get in touch with *Barbapiccola* and the *Israel*? I don't want anyone dying because they don't know to turn the engines back on. And we may need to use the *Israel*'s shuttle, if we can talk them out of it."

"We may need to do a little debrief at some point here," Alex said. "Things have been kind of dynamic. But let me go make sure everybody's reactors are ticking over first, all right?"

"Okay," Holden said. "And if you could drop us some food?"

"Soon as I get the galley powered up," Alex said.

"Right. Good. And Naomi... she's...?"

"Everybody's all right," Alex said. "We're all going to be fine."

By the time Havelock and Doctor Merton had finished the inventory, a team of builders were already fitting batteries into fabrication units and measuring out the places where walls would be going up. Real human shelters. A new First Landing. The self-selected construction crew was a mix. Some were squatters who'd come on the dead refugee ship. Some were people Havelock had shipped out with. The divide between them still existed in his mind, but didn't seem to be playing out on the ground. The death of the heavy shuttle and the burning of the terrorist cell seemed like things that had happened in some other epoch. He supposed it was something about the storm, the blindness, the death-slugs, and the constant awareness of mortality just outside the door, clearing its throat. It wasn't a model of community building that he'd recommend trying to scale up, but it had worked here. Temporarily. For now.

A dark-skinned woman with long black hair detached from the group. She looked familiar, but it still took Havelock a few seconds to place her. The time downstairs had taken all the padding out of her cheeks.

"Doctor van Altricht."

"Call me Sudyam," she said. "Everyone else does."

"Sudyam, then," he said, holding out his hand terminal. "I've got some paperwork for you."

"Excellent," she said, taking it. Her gaze flickered over the contract addendum too quickly for her to really be taking it all in. At the bottom, she signed her name with a fingernail and pressed the pads of her index and middle fingers to the screen. The hand terminal chimed, and she handed it back.

"Congratulations," Havelock said. "You are now the official field lead for the RCE research team."

"And a worse job, I can't imagine," she said, smiling. "Now that I'm official, can you tell me when we're getting replacement equipment?"

"There's an unmanned supply pod under heavy burn to Medina," Havelock said. "Assuming the OPA doesn't impound it or call it salvage, it should be here in six, maybe seven months."

"And the chance of the OPA stopping it?"

"I wouldn't make it better than three in ten," Havelock said. "But honestly, don't sniff that number. You don't know where it's been."

The biochemist shook her head in mild disgust. "Well, it'll have to do,"

she said.

For almost a week after the power came back on, the *Rocinante* and the *Israel* had been in a very delicate political state. The Belters on the *Israel* had been taken in as a gesture when it was pretty certain that the thing was symbolic because they were all going to be dead anyway. Now that they weren't going to die, the question of status—were the Belters refugees, prisoners, or paying passengers?—became a much more contentious issue. Marwick had to decide whether they were going to be on his ship for the full eighteen months back to Medina, or if he was going to try to place them all downstairs. It didn't help matters that with all the shuttles slagged, the only ways down to the surface were on board the *Rocinante* or a really long, unpleasant jump.

In the end, the break was almost even. About half of the crew of the *Barb* elected to stay with the colonists and scientists on the ground. About half of the RCE staff still in orbit, having come this far and being profoundly uninterested in just looking at the promised land from the mountaintop, elected to stay on the planet. Of the science teams that had been on the ground from the start—Vaughn, Chappel, Okoye, Cordoba, Hutton, Li, Sarkis, and a dozen others—only Cordoba elected to come back up the well and go home, and that apparently had more to do with grief over a failed romantic relationship than the fact the entire planet had been doing its best to kill them. It wasn't something Havelock understood, but it didn't need to be.

The ship repairs were under way when night fell, the scaffolding and the hull of the ship flickering brightly and then going dark as the welding torches did their work. The sunset was a massive canvas of gold and orange, green and rose, gray and indigo and blue. It reminded him of beaches on the North American west coast, except there were no vendors clogging the place and no advertising drones muttering about the joys of commerce. It was beautiful, in its way. He wouldn't have been surprised to see a bonfire burning, and a bunch of the colonists sitting around it playing guitars and getting high, except that there was nothing left in the aftermath of the flooding that would burn and if there was anything on the planet that would give you a safe buzz, they'd grown it on the *Israel*.

He hauled himself up into the *Rocinante* and limped back to the bunk Naomi had assigned him. It was the first time he'd been in the *Roci* when it

had an up and down, and because the ship didn't land along the thrust vector, he walked along walls for the most part. The shredded muscles in his thigh and calf were regrowing slowly, and his knee might need another round of repairs to swap out the cartilage. Considering everything else that had happened, it was a great set of problems to have.

In his bunk, he checked his personal messages. The message he'd been dreading was there. Williams' family was filing criminal and civil charges against him for wrongful death. His union representative was already counterfiling and RCE was being strangely cooperative. By the time the *Israel* returned to her home port, he hoped everything would be cleared up. He wished there was a way to send a message to Williams' people and apologize. Explain that he'd tried to just disable the suit, and that he was very, very sorry that it had happened the way it did. His union rep had made him promise not to, though. There would be a chance for that when the issue was settled.

There was also a message from Captain Marwick with the subject header of I BELIEVE I OWE YOU A DRINK and a pass-through to one of the major newsfeeds. Havelock followed it.

The screen filled with the banner insets of the feed, but the central image was weird to look at. As he watched, the *Barbapiccola*, tumbling slowly on its tether, bloomed and a puff of perfectly round plastic bubbles came out. It was like watching a flower releasing seeds to the wind. A man's voice, gentle, deep, and reassuring, came under the image, speaking Belter-accented English.

"New footage today from the stunning rescue operations on New Terra. What you're seeing now are images captured by the Royal Charter Energy ship *Edward Israel* of the mass evacuation of the disabled freighter *Barbapiccola*. For those of you new to this story, all three ships were reduced to working under battery power at the time this occurred, and while the *Barbapiccola* was lost to an uncontrolled atmospheric entry, all hands and passengers were transferred to the *Israel* for medical evaluation and aid under the supervision of acting security director Dimitri Havelock."

The image shifted to an image of him from his official report back to RCE. His hair stood away from his head, making him look like he was trying to be a Belter, and his voice sounded weirdly high and whiny.

“The transfer was completed in under three hours. I would specifically like to commend Captain Toulouse Marwick for his prompt and professional aid, without which we could not have managed this without considerable loss of life.”

The feed ended, and Havelock laughed. He requested a connection to Marwick, and the red-haired man appeared almost immediately.

“So I guess they aren’t firing us,” Havelock said.

“They’d be giving us a ticker-tape parade when we got home if anyone still used ticker tape,” Marwick said. “This right now is when we should all be asking for raises.”

“Hazard pay,” Havelock said, propping his head up with his arm.

“Heroes of the hour, we are,” Marwick said. “Not that they really have much clue back there what it was really like. One of those things you can explain as clearly and concretely as you want, and they still don’t get it.”

“That’s fine,” Havelock said. “They don’t need to. I’m going to have a request list from the research and survey team. Do you think there’s anything else we can give them?”

“Depends,” Marwick said. “The *Rocinante* convoying back to the Ring with us?”

“I think so,” Havelock said. “I can confirm that.”

“If we’ve got them for backup, I can strip the place down a little bit more. Not a great deal, but we could break down one of the backup generators and drop it to them. And biomass for the galleys.”

“Actually, I think we’re okay on that. Doctor Okoye was talking about a way to convert the local flora into something that could be turned into something that they could eat. It had something to do with right-handed molecules, whatever those are.”

“Well, good on her, then,” Marwick said. “Almost makes you want to stay a while, doesn’t it? See how it all plays out?”

“Oh shit no,” Havelock said. “No, you should see this place. It’s tiny, it’s filthy, and everything about it is slapped together with hot glue and prayer. Also, there are slugs that instantly kill you. If these people survive for a year, I’ll be surprised.”

“Really?”

“You know that in a month or two or eight or whatever, something’s got to happen. The hydroponics will fail out, or there’ll be another thing like

that eye-eating goop only they won't happen to have a treatment for it ready to hand, or one of the attack moons will drop out of the sky. Shit, the fucking death-slugs could grow wings. How do we know they can't do that? We *do* know there are power plants in the ocean big enough to damn near blow the planet off course. Holden says they're all dead now, but he could be wrong. Or turning everything off might mean there's some kind of reactor core sinking down into the planet. We don't know *anything*."

Marwick looked nonplussed, but he nodded. "I suppose that's true."

"No, what I want is Ceres Station or Earth or Mars. You know what they have in New York? All-night diners with greasy food and crap coffee. I want to live on a world with all-night diners. And racetracks. And instant-delivery Thai food made from something I haven't already eaten seven times in the last month."

"You make it sound like paradise indeed," Marwick said. "Still, I can't help feeling uncomfortable at the idea of leaving all these poor people if they're really going to die from staying."

"Maybe they won't," Havelock said. "Wouldn't be the first time recently I was wrong about something. And... well, they've got some things in the plus column too. I think they've got more scientists and engineers per capita than anyplace else in the universe. And we're giving them all the supplies we can manage."

"Still, seems thin."

Havelock sat up a degree, his crash couch shifting and hissing on its gimbal. "They also have each other. For now, anyway. You have to figure when we started this, everyone was ready to slit everyone else's throat, and they're down here now putting up tents together. If nothing new comes along to kill them, there will be native-born New Terran babies as soon as biology permits. And I wouldn't bet that the parents will all have come here on the same ship."

"Well," Marwick said. "It's good to recall that wherever people start, whatever they bring with them, humanity can still pull together in heavy weather."

Havelock shrugged. Koenen's voice was still fresh in his memory, and Williams drifting flatlined and dead. Naomi Nagata in her cell. The Belter engineer whose locker people had been peeing in. The shuttle he'd rigged as a weapon. Jesus, he felt bad enough about Williams. He could barely

imagine what it would have been like if he'd deployed the weaponized shuttle.

“Sometimes we do, sometimes we don’t. These people could just as easily have gone down with their teeth in each other’s throats. That happens too. It’s just the folks that go that way aren’t around to write the history books.”

“Amen,” Marwick said, chuckling. “Amen indeed.”

Chapter Fifty-Six: Holden

The *Rocinante* had really taken a beating.

The ship had a variety of puncture wounds in the outer hull all along her port side. Holden could see the bright spots where Basia and Naomi had replaced damaged thruster ports, but they hadn't had the time or materials to patch all the holes. It was a testament to Alex's skill as a pilot that he'd been able to bring them down at all without burning up. At least one PDC housing was riddled with damage, and the weapon inside was probably unsafe to use. And there was a long scar across the top of the ship where, according to Naomi, an improvised missile had hit.

Holden cheerfully noted each future repair on his itemized bill for Avasarala.

The *Rocinante* sat on a wide stretch of nothing half a kilometer from where First Landing had once stood. The frames of new construction were starting to appear. People, building on the ruins of what had come before, just like they always did. So many things had been lost, but it was the missing people that hurt the most.

Just like they always did.

Holden noted a spot of minor damage on the drive cone, then came around the stern of the ship to find a pair of Belters throwing up a temporary shelter a dozen yards away. A man in his early thirties was running cable while an older woman hammered spikes into the muddy ground. A second woman stood by with a long pole to flick away any slugs that might get too close.

"You can't put that there," Holden said, walking toward them and making a shooing gesture. "Ask Administrator Chiwewe where to put your

tent.”

“This spot hasn’t been claimed by anyone,” the man said. “We have just as much right—”

“Yes, yes. I’m not telling you where you can and can’t build. But in a few hours this ship is going to lift off, and it will flatten your little tent.”

“Oh,” the man said, sheepish. “Right. We’ll just wait for you to go.”

“Thank you. You folks have a good afternoon.” Holden gave them a wave and a smile and headed off toward New First Landing. These people were still the same ones who had been willing to fight RCE to the death to hang on to their claim. They weren’t going to put up with being bossed around by outsiders. But the catastrophe had at least taught them to respect high-speed winds.

When he returned to the rectangle of six partially built structures that would eventually become New First Landing’s town square, Carol was in a heated discussion with someone in an RCE engineering uniform and Naomi. Amos stood nearby, staring at nothing, a faint smile on his broad face. The medical apparatus on his leg and hand made him look like a cyborg. The bandage on his neck made him look like a pirate. Amos wore serious injury better than anyone else Holden knew. Fayez, by comparison, was still walking with a limp. Or maybe he was just making excuses to keep his arm around Elvi Okoye’s shoulder.

Basia, Lucia, and Jacek were clumped up a respectful distance away from the argument, gripping each other like their lives depended on unbroken contact.

“I don’t care what it says in the book,” Carol was saying. “I want all six of these structures on *one* generator. We only have two. I need the other for the rest of the town.”

“These are your highest-use buildings,” the engineer replied. “The loads will be at the limit of—”

“They build a little slack in there,” Naomi said over the top of him. “And that’s what the administrator wants, so give it to her.”

The engineer rolled his eyes and shrugged. “Yes, ma’am.”

“Everyone getting along?” Holden asked as he approached.

“Land of milk and honey, Cap’n,” Amos said. “Peaceful as a sleeping kitten.”

“How’s she looking?” Naomi asked, stepping away from the group as

their argument relaunched behind her.

“Pretty beat up.”

“We did our best.”

“You guys were amazing,” Holden said, taking her hand. “But next time don’t let the bad guys capture you.”

“Hey,” Naomi said with mock outrage, “I rescued myself.”

“Been meaning to ask about that. How exactly *did* you persuade your jailer to come over to our side?”

Naomi moved a step closer and grinned down at him. “It was prison. People do all sorts of things they wouldn’t normally do in extreme circumstances like that. You sure you want to know?”

“I don’t care even a little,” Holden said, then pulled her into a hug. She almost collapsed against him.

“God, don’t let go,” she whispered in his ear. “My knees are killing me. Another hour of walking around in this gravity and I’m going to need ligament replacements.”

“Then let’s get the hell out of here.”

Holden leaned around Naomi enough to catch Amos’ eye, then jerked his head toward the ship. The mechanic nodded and smiled and began hobbling around the square loading up the last of their gear.

“Is our prisoner on board?”

“Amos locked him in medical a couple hours ago,” Naomi said, then let her entire skeleton relax with a long groan.

“Can you walk back to the ship?” Holden asked her.

“Yep. Say your goodbyes.”

Holden let her go, watching her stagger off on unsteady legs for a few moments before he turned back to shake hands with Carol Chiwewe. She and the RCE man had moved their argument to sewage systems and water treatment. After a brief goodbye and good luck to them both, he walked over to Basia and his family.

“Doctor,” he said to Lucia, shaking her hand. “Could not have survived this without you. None of us could.” Next he shook Jacek’s hand. Finally, he shook Basia’s. “Basia. Thanks for your help with the ship. And thank you for trying to help Naomi. You’re a brave man. Farewell and fair weather.” The roiling storm clouds and gentle drizzle of rain made a joke of it, and he grinned at them.

“What?” Basia said. “But I thought you had to take me to—”

Holden was already walking away, but he stopped and said, “Work hard. Next time I come to this planet, I want to be able to get a decent cup of coffee.”

“We will,” Lucia replied. Holden could hear her tears in her voice, but the rain hid them on her face.

He wouldn’t miss the planet, but he would miss the people. Just like always.

On the *Rocinante*, liftoff pressed Holden into his crash couch like the ship was welcoming him back with a hug. As soon as they hit low orbit, he floated out of his chair and down the crew ladder to the galley. Thirty-five seconds later, the coffee pot was gurgling to itself and the rich aroma of brewing filled the air. It made him feel giddy.

Naomi floated in. “The first step is admitting that you have a problem.”

“I do,” he replied. “But I’ve just spent a couple months down on a planet that spent the entire time trying to kill me. And I have a shitty job I have to go do, so I’m going to take a moment and make a cup of coffee first.”

“Make me one too,” she said, then pulled herself over to the wall panel and started paging through status reports.

“Make it three,” Amos said, dragging himself into the room. “I got a ton of shit to fix because you guys let someone use my girl for target practice.”

“Hey, we did our best—” Naomi started, but was cut off by the comm panel squawking.

“You guys makin’ coffee down there?” Alex said from the cockpit. “Have someone bring me up a bulb.”

While Amos and Naomi began putting together a list of the repair work they could do during the long transit back to Medina Station, Holden prepared four large bulbs of coffee. He didn’t mind. It was very comforting doing something simple and domestic to make other people happy. Black for himself. Two whiteners, two sweeteners for Amos. One whitener for Alex. One sweetener for Naomi. He handed the finished bulbs out.

“Can you take this up to Alex?” he asked, handing a second bulb to Naomi. Something in his voice or his face made her frown with worry.

“Are you okay?” she said, taking the bulb but not leaving. Behind her, Amos took his coffee awkwardly in his mangled hand and headed aft with it toward his machine shop, looking at the task list on his terminal and muttering about how much work he had to do.

“Like I said, shitty job needs doing.”

“Can I help?”

“I’d like to do this one alone, if that’s okay.”

“Of course it is,” she said, then kissed him lightly on the cheek. “I’ll look you up later.”

Holden went up to the airlock and storage deck and found a self-sealing vacuum package, a trowel, and an EVA suit for doing external repairs with a portable blowtorch. He climbed into the suit, then clumped through the ship to the cargo bay.

To what he was pretty sure was Miller’s final resting place.

He waited in the cargo bay airlock while the outer doors cycled open, putting the compartment into total vacuum, then went in. If something went wrong, if what was left of the protomolecule on his ship decided to defend itself, he’d be in vacuum with an airlock blocking entry into his ship. He sealed the airlock behind him, and told Alex to lock out local control on the door until he called and asked him to open it. Alex agreed without asking why.

And then Holden began methodically tearing the cargo bay apart.

Five hours later, and one air recharge for the suit, he found it. A small blob of flesh no larger than the tip of Holden’s finger, attached to the underside of a power conduit behind a detachable panel in the cargo bay’s bulkhead. When they’d first spotted the protomolecule monster that had hitchhiked onto the *Roci* from Ganymede, it had been less than half a meter from where he found the polyp. It made his skin crawl to realize how long they’d been lugging this last remnant of that monster around on his ship.

Using the trowel, he scraped the polyp off the conduit, then put both it and the tool into the vacuum bag and activated the charge to seal it. He blowtorched the conduit for several minutes, heating the metal red to kill any residue left by the scraping. Then he dug through the supplies in the cargo area until he found a reload for the ship’s probe launcher, opened the probe up, and stuffed the bag inside the casing.

He linked his suit radio to the *Roci*’s general shipwide channel. “Naomi,

you around?”

“Here,” she said after a moment. “In ops. What do you need?”

“Can you grab manual control on probe, uh, 117A43?”

“Sure, what do you want me to do with it?”

“I’m going to chuck it out the cargo bay door. Can you give it about five minutes, then send it into Ilus’ sun?”

“Okay,” she replied, not asking the question he could hear in her voice she wanted to. He killed the radio.

The probe was a small electromagnetic and infrared sensor with a rudimentary drive system. The kind naval vessels used to see what might be hiding on the other side of a planet. It wasn’t much bigger than an old Earth fire hydrant. It had heft, though. When Holden pushed it over to the cargo bay door, it was difficult to stop it again.

Outside, Ilus spun by, the angry brown of her cloud layer starting to show some spots of white, and even the occasional flash of blue from the ocean underneath. It’d be a while, but the planet would bounce back. Mimic lizards would return and start competing for space with human children and those annoying little bugs that bit and then fell over dead. Two alien biologies fighting for space. Or three. Or four. Nothing that Ilus hadn’t already experienced a few billion years before. New fight, same as the old fight.

Holden put a gloved hand on the probe floating next to him, and pointed the other at the planet.

“That’s you, man. That’s the second world you’ve saved. And once again, we have nothing to offer you in return. I kind of wish I’d been nicer to you.”

He laughed at himself, because he could almost hear the old detective in his head saying, *You could also have my Viking funeral not be all about how you feel.*

“Right. See you on the other side,” Holden didn’t really believe in another side. Nothing after death but infinite black. Or, he hadn’t, anyway. Sure, out-of-control alien technology might be involved, but maybe, just maybe, sometimes there was something else. “Goodbye, my friend.”

He gave the probe a hard push, and it drifted slowly away from the ship. Holden watched it dwindle until it was just a tiny point of light reflected from Ilus’ star. Then it lit up for a few seconds with a short drive flare and

streaked away from the planet. Holden waited until he couldn't see it anymore, then shut the cargo bay doors.

He stripped the vacuum suit off in the airlock after it cycled. Naomi was waiting for him when the inner airlock door opened.

"Hey," he said.

"Is it done?"

"Yeah, I'm all done down here."

"Then come to my room, sailor," she said. "There's something there I want to show you."

Holden floated half a meter above his bed, his body soaked with sweat. Naomi drifted next to him, long and lean, hair wild from their lovemaking. He touched his own scalp, feeling the weird sweaty points his own hair had become.

"I must look a fright," he said.

"Hedgehogs are cute. You're fine." Naomi tapped one long toe against the bulkhead and drifted a few centimeters closer to the atmospheric controls. She aimed the airflow vent at them both, and Holden's skin tingled as the cool air dried him.

"I don't think I'll ever be able to take enough showers to wash Ilus off of me," he added after a moment.

"I was in a brig for a couple of weeks. Trade you."

"Sorry about that."

"Not your fault. Just bad luck. Did you know that the security guy Havelock was Miller's partner on Ceres?"

Holden touched the bed so he could rotate his body and look at her. "You're shitting me."

"Nope. Before we met him, of course."

"Wish I'd known."

"You think you do, but it would have been weird."

"Probably right," Holden said, then sighed and stretched until his joints popped. "I'm never doing that again."

"Which that?"

"Leaving you. When I thought I was going to die down on Ilus and you

were going to die in orbit and we wouldn't even be able to hold each other when it happened, it was the worst thing I could possibly think of."

"Yeah," she agreed with a nod. "I understand."

"I promise it won't happen again."

"Okay. Why'd you let Basia go?"

Holden frowned. The truth was, he wasn't really sure why he had. And it was something he'd been trying hard not to think about too much.

"Because... I like him. And I like Lucia. And breaking up their family wouldn't solve anything. I bought his story about blowing the landing pad early to try and save people. Plus, he's not going to be setting any more bombs. And the one thing Murtry told me that made me really think is that we're beyond the borders of civilization right now. Black-and-white legal arguments don't make a lot of sense here. Someday, maybe."

"The frontier doesn't have laws, it has cops?" Naomi said, but she smiled when she said it.

"Ouch," Holden replied and she laughed.

They drifted together in companionable silence for a few minutes. "Speaking of which, I should probably go see our prisoner," Holden finally said.

"To gloat?" Naomi said, poking him in the ribs. "You love that thing at the end where you gloat."

"It's what makes this all worth doing."

"Go," she said, putting her feet against the bulkhead and then pushing him toward the closet with her hands. "Get dressed. And comb your hair."

"I'll be back soon," he agreed, pulling clothes out of the drawers. "I have another thing I want you to show me."

"Making up for lost time."

"Damn straight."

Holden stopped off at the head to brush his teeth and wash his face before visiting Murtry in the med bay. While he worked to get the knots and tangles out of his hair, Amos drifted in and then just waited.

"Am I in the way or something?" Holden asked. "Do you need privacy?" Amos had never been shy with his toilet usage before.

“Naomi says you’re going to see Murtry,” Amos said, keeping his tone carefully neutral.

“Yep.”

“You told me I wasn’t allowed to go see him.”

“Nope.”

“Can I go with you, then?” Amos asked.

Holden almost said no, then thought about it for a minute and shrugged. “Sure. Why not?”

Murtry’s leg wound hadn’t been particularly serious, but Holden’s bullet had shattered his right humerus, so they were keeping him locked up in the medical bay while the expert system tracked the bone regrowth. The RCE security chief had his left arm handcuffed to the crash couch. When the arm was better healed, they’d move him to one of the crew cabins where Amos had added exterior locks.

“Captain Holden,” Murtry said when they entered. “Mister Burton.”

“So,” Holden said as though picking up a conversation they’d started earlier. Which, in a way, they had. “Got a message from my pal at the UN a few hours ago. She can’t wait to meet you. We’ll be dropping you at the UN complex in Lovell city on Luna. I took another prisoner there once, and that person has since ceased to exist as far as the rest of the solar system knows. Hey, maybe they can get you two adjoining cells.”

“You keep talking like I’ve broken the law. I haven’t,” Murtry said.

“There’s a really smart legal team on Earth right now trying to think of some. They have almost two years to work it out. Enjoy the trip back.”

“And I,” Amos said, “am here to tell you why you won’t.”

“I can’t hear this,” Holden said. “He’s my prisoner.”

“Maybe you should leave, then,” Amos said.

Holden stared at Murtry, and the man stared back. “Okay, Amos. Meet me in the galley in a minute.”

“Roger that, Cap,” Amos said, smiling at the prisoner as he said it.

Worried that he might have just killed the man, Holden waited around the corner outside the med bay door.

“Going to beat a helpless man in his hospital bed just because I got the better of you?” Murtry asked, trying to hide his unease with contempt.

“Oh, goodness no,” Amos said, mock hurt in his tone. “That’s all good. Smart move taking me from behind. I don’t hate the game. I appreciate a

good player.”

“Then—” Murtry started, but Amos kept speaking.

“But you made me kill Wei. I liked Wei.”

The silence between the two men stretched, and Holden almost went back into the room, expecting to find Amos choking the man to death. Then Amos spoke again.

“And when I *do* finally beat you, you won’t be helpless. Think that’ll matter?”

Holden didn’t wait to hear the rest of what was said.

Epilogue: Avasarala

Vyakislav Pratkanis, the Martian congressional Speaker of the House, had an excellent poker face. Over three days of meetings and meals and evenings at the theater and cocktails, he'd never registered more than a milquetoast kind of surprise. Either he was panicking on the inside, or he simply didn't understand the situation. Avasarala's guess was the latter.

"I'm sorry I can't come with you this evening," he said, his hand shaking hers with a crisp, dry efficiency.

"You're a good liar," she said with a smile. "Most men who've spent so much time with me seem convinced their cocks will fall off if they can't get away from me."

His eyes widened with a gentle laughter that he'd almost certainly practiced in a mirror. She responded in kind. The government houses were in Aterpol, the highest-status of the buried neighborhoods of Londres Nova. Six more communities were scattered under the soil of Mars' Aurorae Sinus. She had to admit, the Martians had done a respectable job recreating the world here underground. The false dome of Aterpol was high above her and lit with a carefully balanced spectrum that managed to convince her lizard brain that she was in the open air of Earth. The government buildings were designed with a light airiness that almost forgave the fact that the entire city—the entire planetary network—was built like a fucking tomb. The absence of a magnetosphere had made Mars' first priority protection from the radiation. Between that and the low gravity that left her unintentionally skipping down the corridors like a schoolgirl, she hadn't fallen in love with the planet.

"It has been an honor to share perspectives with you," he said.

She bowed her head. “Really, Vyakislav. We’re off the clock now. You can stop blowing smoke up my ass.”

“As you say,” the man said, his expression not changing at all. “As you say.”

In the corridor down to the atrium, she tugged at her sari, pulling the cloth back into place. Not that it had particularly been out, but the weight was wrong and the back of her head kept wanting to pull on it until it was right. Soft lights nestled in stone sconces along the walls. The air smelled of sandalwood and vanilla and chimed with gentle, soothing music. It was like the government was a middle-grade day spa.

“Chrisjen!” a man called out as she reached the high-vaulted atrium. She turned back. He was a large man with skin several shades darker than her own and hair only a little whiter than her steel gray. He held out his arms as he walked forward and she embraced him. No one would have guessed, seeing them, that they ran the governments of two of the three great political organizations of humanity. Earth might fear the Belt, and the Belt might resent Earth, but the OPA and the United Nations had diplomatic decorum to maintain, and in truth, she halfway liked the old bastard.

“You weren’t going to leave without saying goodbye, were you?” he asked.

“I don’t ship until tomorrow,” she said. “I was just going out for dinner with friends.”

“Well, I’m pleased to see you all the same. Do you have a minute?”

“For the military head to the largest terrorist organization in known space?” she said. “How could I not. What’s on your mind?”

Fred Johnson walked forward slowly and she fell into step with him. The atrium was polished stone. A fountain in the center let water flow slowly down the sides of an abstract and genderless human figure. He sat at the fountain’s edge. She thought the slow ripples made the liquid seem oily.

“I’m sorry I couldn’t support you more in there,” Fred said. “But you understand how it is.”

“I do. We’ll do what we can around the edges, the same as we always do.”

“We have a lot of Belters in those ships. If I take too hard a line with them, it’ll be worse than taking one that’s too soft.”

“You don’t have to apologize to me,” Avasarala said. “We’re both

constrained by the realities of the situation. And anyway, at least we're not as fucked as Pratkanis."

"I know," Johnson said, shaking his head.

"Is Anderson Dawes still managing the political side out there?"

Johnson shrugged. "For the most part. It's herding kittens. If kittens had a lot of guns and an overdose of neo-Libertarian property theory. What about you? How's Gao doing as secretary-general?"

"She isn't stupid, but she's learning to fake it," Avasarala said. "She'll say all the right words and make all the right hand gestures. I'll see to it." Fred Johnson grunted. The fountain bubbled and the crappy soothing music failed to soothe. She felt like they were on the edge of something, but that was an illusion. In truth, they'd gone over the edge a long time back.

"Take care of yourself, Fred," she said.

"We'll be in touch."

Joint Martian and UN security had blocked off the tube station for her. She sat in a tube car with blacked-out windows and three armed security men at the doors. The shaped-plastic seat faced the side, and she could see herself in the reflection. She looked tired, but at least the low g made her seem younger. She was afraid age had been making her jowly. The car hissed along its track. Outside, the tube was in vacuum to reduce drag. She laid her head against the side of the car and let her eyes close for a moment.

Mars had been the first. Not the first station or the first colony, but the first attempt by humanity to cut ties from Earth. The upstart colony that declared its independence. And if Solomon Epstein hadn't been a Martian and hadn't perfected his drive just when he had, Mars would have been the site of the first true interplanetary war. Instead, Earth and Mars had made the kind of rough friendship where each side could feel superior to the other and they'd set about carving up the solar system. So it had been for as long as she could remember.

That was the danger of being old and a politician. Habits outlived the situations that created them. Policies remained in place after the situations that inspired them had changed. The calculus of all human power was changing, and the models she used to make sense of it shifted with them,

and she had to keep reminding herself that the past was a different place. She didn't live there anymore.

The tube stopped in Nariman, and Avasarala got out. The station was packed with locals who'd been put off until her journey was complete. On Earth, they would have been a mishmash of Anglo and African, Asiatic and Polynesian. Here, they were Martian, and she was an Earther. As the security detail ushered her out to an electric cart, she wondered what they would be next. New Terrans, she supposed. Unless the squatters' naming schema won out. Then... what? Ilusians? Illusions? It was a stupid fucking name.

And God, but she was tired. It was all so terribly large and so terribly dangerous, and she was so tired.

The private room at the back of the restaurant had been closed off for her. A space made for two, maybe three hundred people. Crystal chandeliers. Silverware that was actually silver. Cut crystal wineglasses and carpeting that had been manufactured to mimic centuries-old Persian carpets. Bobbie Draper sat at the table making everything around her seem small just by being near it.

"Fuck," Avasarala said. "Am I late?"

"They told me to come here early for the security check," Bobbie said, standing up. Avasarala walked to her. It was odd. She could embrace Fred Johnson with ease and grace, and she barely cared about him as anything more than a political rival and a tool. Bobbie Draper she genuinely liked, and she wasn't sure whether she should hug the former gunnery sergeant, shake her hand, or just sit down and pretend they saw each other every day. She opted for the last.

"So veteran's outreach?" she said.

"It pays the bills," Bobbie said.

"Fair enough."

A young man with sharp, beautiful features and carefully manicured hands ghosted forward and poured water and wine for them both.

"And how have you been?" Bobbie asked.

"All right, over all. I got a new hip. Arjun says it makes me cranky."

"He can tell?"

"He's got a lot of practice. I fucking hate the new job, though. Assistant to the undersecretary was perfect for me. All the power, less of the bullshit.

Now with the promotion, I have to travel. Meet with people.”

“You met with people before,” Bobbie said, sipping the water and ignoring the wine. “That’s what you do. You meet with people.”

“Now I have to go there first. I don’t like being on a ship for weeks to have a conversation I could have had over a link from my own fucking desk.”

“Yeah,” Bobbie said, smiling. “I think I see what Arjun meant.”

“Don’t be a smartass,” Avasarala said, and the beautiful young man brought them salads. Crisp lettuce and radishes, dark, salty olives. None of it had ever seen the sun. She picked up her fork. “And now this.”

“I’ve been following it in the newsfeeds. Right-to-gate access treaties?”

“No, that’s bullshit. We feed that to the reporters so they have something to talk about. We’ve got bigger fish to fry.”

Bobbie’s fork paused halfway to her mouth. She frowned. Avasarala swigged down half a glass of wine. It was good, she supposed.

“The problem,” she said, pointing her fork at Bobbie for emphasis, “is that I trusted James Holden. Not to do anything I told him to. I’m not an idiot. But I thought he would be himself.”

“Himself, how?”

Avasarala took a bite of the lettuce. “Do you know how many ships are on track to the Ring? Right now, *right now*, we have sixteen hundred ships, and every one of them has been watching New Terra like they were reading fucking tea leaves. Johnson and I sent Holden to mediate because he was the perfect person to show what a clusterfuck it was out there. How ugly it could be. I was expecting press releases every time someone sneezed. The man starts wars all the fucking time, only this time, when I needed a little conflict? Now he’s the fucking peacemaker.”

“I don’t understand,” Bobbie said. “Why did you want conflict?”

“To put the brakes on,” Avasarala said. “To save Mars. Only I couldn’t.”

Bobbie put down her fork. The beautiful young man had vanished. He was good at this job. It was time for them to be truly alone.

“A thousand suns, Bobbie. Three orders of magnitude more than we have ever had before. Can you even imagine that, because most days, I can’t. And some—maybe all—have at least one planet with a breathable atmosphere. A place that can sustain life. It’s what they were selected for. Whatever those fucking boojums were that made the protomolecule, they

were looking for places like Earth. And places like Earth are what they found. Places a lot more like Earth than Mars is. New Terra was the precedent, and the precedent is a fucking feel-good story about how we all come together in a pinch. We have an example of how, if you just get out to one of these planets fast enough and squat hard enough, you get to keep it. Welcome to the greatest migration in the history of human civilization. Fred Johnson thinks he can keep control of it because he's got the choke point at Medina Station, but he's also got the OPA. It's already too late."

"Why try to control it at all? Why not let people settle where they want?"

"Because Mars," Avasarala said.

"I don't understand."

"Mars has the second largest fleet in the system. Something like fifteen thousand nuclear warheads. Sixteen battlecruisers. Who the fuck knows how many other fighting vessels. The ships are newer than Earth's. The designs are better. They're faster. They have heat signature masking and fast water cycling and high-energy proton cannons."

"The proton cannons are a myth."

"They aren't. So here you have the second most powerful navy that there is. What's going to happen to it?"

"It's going to protect Mars."

"Mars is dead, Bobbie. Holden and this Havelock sonofabitch and Elvi Okoye, whoever the fuck she is? They killed it. Half the Martian government understands, and they're shitting themselves so hard, they won't have bones left. Who the fuck's going to stay on Mars? A thousand new worlds where you don't have to live in caves and wear environment suits to walk under the sky. No one's going to be here. Do you know what would happen if half the population of Earth left for the worlds beyond the Ring?"

"What?"

"We'd knock down some walls and make bigger apartments. That's how many people we have on basic. Do you know what happens to Mars if twenty percent of the population leaves?"

"The terraforming project shuts down?"

"The terraforming project shuts down. And upkeep on the basic infrastructure becomes harder. The tax base collapses. The economy craters."

The Martian state fails. That is *going* to happen, and the one chance we had to keep it in check is gone. You will have a shell of a government with a planet nobody wants because nobody needs. The raw materials they have to put on the market are now abundant in a thousand new systems where the mining is simple and you don't choke to death on vacuum if the rig fails out. And the one thing—the *one* thing—you have left you can sell? Your one resource?"

"Is fifteen thousand nuclear weapons," Bobbie said.

"And the ships to use them. Who's going to have those ships when Mars is a ghost town, Bobbie? Where are they going to go? Who are they going to kill? We're all moving out our pawns for the first interstellar military conflict. And James Holden, who could have made New Terra a poster for why you might rather stay home and give us a little breathing room, instead found a bright new way to fuck things up."

"By succeeding?"

"By some definition of that word."

"The planet blew up on him," Bobbie said.

"Small favors," Avasarala replied with a snort.

"Well," Bobbie said. "Shit."

"Yes."

They were quiet for a long moment. Bobbie looked at her salad without seeing it. Avasarala finished her wine. She could see the former marine tracking though the lines of implication and consequence. Bobbie's eyes went hard.

"This dinner. We're at a recruitment meeting, aren't we?"

Avasarala folded her hands.

"Bobbie, as long as we're all pushing out our pieces..."

"Yes?"

"I need to put you back on the board, soldier."

Acknowledgments

As always, there were a lot of people without whom this book wouldn't have seen the light of day. We owe particular debts of gratitude to our agent Danny Baror and to our editor Will Hinton, the amazing team at Orbit, the gang from Sakeriver, and Joseph E. Lake Jr. All of them have helped make this a better book. All the errors of fact and logic and infelicities of language are on us.

NEMESIS GAMES

Book Five of the Expanse

by James S. A. Corey

A thousand worlds have opened, and the greatest land rush in human history has begun. As wave after wave of colonists leave, the power structures of the old solar system begin to buckle.

Ships are disappearing without a trace. Private armies are being secretly formed. The sole remaining protomolecule sample is stolen. Terrorist attacks previously considered impossible bring the inner planets to their knees. The sins of the past are returning to exact a terrible price.

And as a new human order is struggling to be born in blood and fire, James Holden and the crew of the Rocinante must struggle to survive and get back to the only home they have left.

PROLOGUE: FILIP

The twin shipyards of Callisto stood side by side on the hemisphere of the moon that faced permanently away from Jupiter. The sun was only the brightest star in the endless night, the wide smear of the Milky Way brighter by far. All along the ridges of the craters, harsh white work lights glared down onto buildings, loaders, scaffolds. The ribs of half-built ships arced up over the regolith of stone dust and ice. Two shipyards, one civilian and one military, one Earth-based and one owned by Mars. Both protected by the same anti-meteor rail-gun defenses, both dedicated to building and repairing the vessels that would take humanity out to the new worlds beyond the rings when and if the fight on Ilus got worked out.

Both in a lot more trouble than they guessed.

Filip slid forward, the rest of his team close behind him. The suit LEDs had been gouged out, the ceramic plating scoured until nothing was smooth enough to cast a reflection. Even the Heads Up Display was dimmed almost to the point of invisibility. The voices in Filip's ears—ship traffic, security feeds, civilian chatter—were picked up on passive. He listened, while transmitting nothing in return. The targeting laser strapped to his back was powered down. He and his team were shadows among shadows. The faint countdown timer in the left of his visual field passed the fifteen-minute mark. Filip patted air barely thicker than vacuum with an open palm, the Belters' physical idiom to move forward slowly. Around him, his team followed.

High in the void above them, too distant to see, the Martian naval vessels guarding the shipyard spoke in clipped, professional tones. (As thinly as their fleet had been stretched, they had only two ships in orbit. Probably only two.) It was possible that there were others hidden in the black, hugging their own waste heat and shielded from radar. Possible but unlikely. And life, as his father said, was risky work.

Fourteen minutes, thirty seconds. Two secondary timers appeared beside

it, one with a forty-five second counter, the other with two minutes.

“Transport ship *Frank Aiken*, you are cleared to approach.”

“Message received, *Carson Lei*,” Cyn’s familiar growl came. Filip could hear the old Belter’s smile in the words. “Coyos sabe best ai sus bebe come we low?”

Somewhere up there, the *Frank Aiken* was painting the Martian ships with innocuous ranging lasers set at the same frequency as the one strapped to Filip’s own back. When the Martian comm officer spoke, there was nothing in his voice that showed fear.

“Don’t copy you, *Frank Aiken*. Please repeat.”

“Sorry, sorry,” Cyn laughed. “You fine upstanding gentlefolk know any good bars a poor Belter crew could get a drink once we get to the surface?”

“Can’t help you, *Frank Aiken*,” the Martian said. “Maintain course.”

“Sabez sa. Solid as a stone, straight as a bullet, us.”

Filip’s crew topped the crater ridge, looking down at the no-man’s land of the Martian military yard; it was just as he had expected it to be. He picked out the warehouses and supply depots. He pulled off the targeting laser, set the base into the dirty ice, and powered it up. The others, spread along the line wide enough that none of the guards would be out of all their sight-lines, did the same. The lasers were old, the tracking platforms strapped to them salvaged from a dozen different sources. Before the tiny red LED on its base turned green, the first of his two secondary timers reached zero.

The security alert tri-tone sounded on the civilian channel, followed by a woman’s anxious voice.

“We’ve got a runaway loading mech on the field. It’s... ah, shit. It’s heading for the meteor array.”

The panic and alarm cascaded in his ears as Filip moved his team long the rim of the crater. Thin puffs of dust rose around them and didn’t fall, widening instead like a mist. The loader mech, failing to respond to overrides, trundled across the no-man’s land and into the wide eyes of the meteor defense canons, blinding them, if only for a few minutes. Four Martian marines emerged from their bunker, as protocol demanded. Their powered armor let them slide over the surface like they were skating on ice. Any one of them could kill his whole team and suffer nothing worse than a moment’s pity. Filip hated them all and each one individually on principle.

The repair crews were already scrambling for the damaged array. The whole thing would be back in order within the hour.

Twelve minutes, forty-five seconds.

Filip paused, looking back at his team. Ten volunteer soldiers, the best the belt had to offer. Apart from himself, none of them knew why the mission to raid the Martian supply depot was important or what it was leading to. All of them ready to die if he told them to, because of who he was. Because of who his father was. Filip felt it in his belly and in his throat. Not fear, pride. It was pride.

Twelve minutes, thirty-five seconds. Thirty-four. Thirty-three. The lasers they'd placed came to life, painting the four marines, the bunker with the backup team, the perimeter fences, the workshops, and the barracks. The Martians turned, their armor so sensitive that even the gentle caress of invisible beams of light was noticed. As they moved they lifted their weapons. Filip saw one recognize the team, gun shifting away from the lasers and toward them. Toward him.

He caught his breath.

Eighteen days before, a ship—Filip didn't even know which one—out in the Jovian system somewhere had made a hard burn, topping out at ten, maybe fifteen gs. At the nanosecond specified by the computers, the ship had released a few dozen lengths of tungsten with four disposable, short-burn rockets at the center of mass and cheap single-frequency sensors tied to them. They were barely complicated enough to be called machines. Six-year-old children built things more sophisticated every day, but accelerated as they were to one hundred and fifty kilometers per second, they didn't need to be complex. Just shown where to go.

In the time it took for the signal to propagate from Filip's eye, down his optic nerve, and into his visual neocortex, it was over. He was aware of the thump, of the ejecta plumes where the Marines had been, of the two brief new stars that had been warships overhead, only after the enemy was dead. He changed his suit radio to active.

"Ichiban," he said, proud that his voice was so calm.

Together, they bounced down the crater's side, shuffling their feet. The Martian shipyards were like something from a dream, plumes of flame rising from the shattered workshops as the stored volatile gasses vented as fire. Soft snow billowed from the barracks as the released atmosphere

sprayed out and froze. The marines were gone, their bodies ripped apart and scattered. A cloud of dust and ice filled the crater, only the guidance of his HUD showing him where the targets were.

Ten minutes, thirteen seconds.

Filip's team divided. Three went to the middle of the open space, finding a place large enough to begin unfolding the thin black carbon structure of the evacuation scaffold. Two others unstrapped recoilless machine pistols, ready to shoot anyone who emerged from the rubble. Two more ran toward the armory, and three came with him, to the supply sheds. The building loomed up from the dust, stark and forbidding. The access doors were shut. A loading mech lay toppled on its side, the driver dead or dying. His tech specialist went to the door controls, prying the housing open with a powered cutting bar.

Nine minutes, seven seconds.

"Josie," Filip said.

"Trabajan, sa sa?" Josie replied curtly.

"I know you're working," Filip said. "If you can't open it—"

The great access doors shifted, shuddered, and rose. Josie turned back and flicked the suit's helmet lights on so that Filip could see the expression on his craggy face. They went into the warehouse. Towers of curved ceramic and steel made great piles, denser than mountains. Hair-thin wire hundreds of kilometers long stood on plastic spools taller than Filip. Massive printers waited, ready to fashion the plates that would fit together over the emptiness, define a volume and make it a bubble of air and water and complex organics that passed for a human environment. Emergency lights flickered, giving the wide space the eerie glow of disaster. He moved forward. He didn't remember drawing his gun, but it was in his hand. Miral, not Josie, was strapping into a loader.

Seven minutes.

The red and white strobe of the first emergency vehicles flickered in the chaos of the shipyard, the light coming from everywhere and nowhere. Filip shuffled down the rows of welding rigs and metal printers. Tubs of steel and ceramic dust finer than talcum. Spiral-core mounts. Layers of Kevlar and foam strike armor piled up like the biggest bed in the solar system. In one open corner of the space, an entire Epstein drive lay disassembled like the universe's most complex jigsaw puzzle. Filip ignored it all.

The air wasn't thick enough to carry the sound of gunfire. His HUD brought up a fast-mover alert in the same moment that a bright patch appeared on the steel beam to his right. Filip dropped, his body seeping down in the microgravity more slowly than it would have under burn. The Martian jumped down the aisle. Not the powered armor of the guards, but a technical exoskeleton. Filip aimed for the center of mass and emptied half his clip. The rounds flared as they left the muzzle, burning their own fuel, tracing lines of fire and red-gray exhaust through the thin Callistan air. Four hit the Martian, and gouts of blood drifted down in a frozen red snowfall. The exoskeleton flipped to emergency alert status, its LEDs turning a grim amber. On some frequency, it was reporting to the yard's emergency services that something terrible had happened. Its mindless devotion to duty was almost funny, in context.

Miral's voice was soft in his ear. "Hoy, Filipito. Sa boîte sa palla?"

It took Filip a moment to find the man. He was in his loader, his blackened vacuum suit becoming one with the huge mech as if they'd been made for each other. Only the dim split circle symbol of the Outer Planets Alliance still just visible beneath the grime marked Miral as anything but an ill-kept Martian mech driver. The canisters he'd been talking about were still lashed to their pallets. A thousand liters each, four of them. On the curving face: High Density Resonance Coating. The energy-absorbent coating helped Martian military ships avoid detection. Stealth tech. He'd found it. A fear he hadn't known he was carrying fell away.

"Yes," Filip said. "That's it."

Four minutes, thirty-seven seconds.

The loading mech's whirring was distant, the sound carried by the vibrations in the structure's flooring more than the thin atmosphere. Filip and Josie moved toward the doors. The flashing lights were brighter, and had taken on a kind of directionality. Filip's suit radio filtered through frequencies crowded with screaming voices and security alerts. The Martian military was ordering back the relief vehicles from the civilian shipyard, concerned that the first responders might be terrorists and enemies in disguise. Which was fair. Under other circumstances, they might have been. Filip's HUD had the outlines of the buildings, the half-built evac scaffold, its best guess on the locations of the vehicles given IR and light trace data too subtle for Filip's eyes. He felt like he was walking through a schematic

drawing, everything defined by edges, all surfaces merely implied. As he shuffled onto the regolith, a deep shudder passed through the ground. A detonation, maybe. Or a building finally completing its long, slow collapse. Miral's loading mech appeared in the open door, backlit by the warehouse lights. The canisters in its claws were anonymous and black. Filip moved toward the scaffold, switching to their encrypted channel as he shuffled.

"Status?"

"Small trouble," Aaman said. He was with the scaffold. Filip's mouth flooded with the metal taste of fear.

"No such thing here, coyo," he said, fighting to sound calm. "What is it?"

"Some of the ejecta crap's fouling the scaffold. I've got grit in the joints."

Three minutes, forty seconds. Thirty-nine.

"I'm coming," Filip said.

Andrew's voice cut in. "We're taking fire in the armory, bosslet."

Filip ignored the diminutive. "How much?"

"Plenty some," Andrew said. "Chuchu's down, and I'm pretty pinned. Might need a hand."

"Hang tight," Filip said, his mind racing. His two guards stood by the evac scaffold, ready to shoot anybody that wasn't them. The three builders were struggling with a brace. Filip jumped over to them, catching himself on the black frame. On the line, Andrew grunted.

Once he saw the stuck connector, black grit fouling it, the problem was clear. In atmosphere, it would just have just taken a hard breath to clean it. Not an option here. Aaman was digging frantically with a blade, flipping out tiny bit after tiny bit, trying to empty the thin, complex channels where the metal fit together.

Three minutes.

Aaman hauled the brace into place and tried to force the connection. It was close, very close, but when he tugged back, it came apart. Filip saw the man cursing, flecks of spit dotting the inside of his faceplate. If they'd only brought a can of air, Filip thought...

Which, of course, they had.

He plucked the knife from Aaman's hand and shoved the blade into his suit's wrist where the articulation made it thinnest. A bright pain told him

he'd gone just a little too far. That was fine. His suit alarm blinked into place, and he ignored it. He leaned forward, pressing the tiny opening in his suit to the clogged connector, the escaping air scattering the dirt and ice. A single drop of blood spat out, freezing into a perfect crimson sphere and bouncing away from the material. He stepped back, and Aaman slid the connection together. When he tugged this time, it held. The injured suit sealed the hole as soon as he pulled the knife out.

Filip turned back. Miral and Josie had cut the canisters free of their pallets and strapped one to the scaffold. The flashing emergency lights had dimmed, the relief vehicles passing them by in the haze and confusion. Heading, likely, for the firefight at the armory. It was where Filip would have seen the greatest threat too, if he hadn't known better.

"Bosslet," Andrew said, his voice thin and anxious. "Cutting close here."

"No preoccupes," Filip said. "Ge gut."

One of the two guards put a hand on his shoulder. "You want me to go fix that?" she asked. *Should I go save them?*

Filip lifted a fist and shook it gently back and forth. No. She stiffened when she understood what he was saying, and for a moment, he thought she'd disobey. Her choice. Mutiny now was its own punishment. Josie slid the last canister into place, tightened down the straps. Aaman and his people fit the last brace in position.

One minute, twenty seconds.

"Bosslet!" Andrew screamed.

"I'm sorry, Andrew," Filip said. There was a moment of stunned silence and then a stream of obscenity and invective. Filip changed frequencies. The emergency services for the military shipyards were shouting less. A woman's voice speaking crisp, calm German was delivering commands with the almost-bored efficiency of someone well accustomed to crisis, and the voices answering her took their professionalism from hers. Filip pointed to the scaffold. Chuchu and Andrew were dead. Even if they weren't dead, they were dead. Filip pulled himself into his position on the scaffold, fitted the straps around his waist and under his crotch, across his chest, then laid his head back against the thick padding.

Fifty-seven seconds.

"Niban," he said.

Nothing happened.

He turned his radio back to the encrypted channel. Andrew was weeping now. Wailing.

“Niban! Andale!” Filip shouted.

The evac scaffold bucked under him, and he suddenly had weight. Four chemical rockets under high burn lit the ground below him, scattering the empty pallets and knocking Miral’s abandoned loading mech on its back. Acceleration pushed the blood down into Filip’s legs, and his vision narrowed. The sounds of the radio grew thinner, more distant, and his consciousness flickered, stuttered. His suit clamped down on his thighs like being squeezed by a giant, forcing the blood back up out of them. His mind returned a bit.

Below, the crater was an oblong blister of dust on the face of the moon. Lights moved in it. The towers at the crater’s edge had gone dark, but flickered now as the systems tried to reboot. The shipyards of Callisto reeled like a drunkard, or a person struck in the head.

The countdown timer slid to two seconds, then one.

At zero, the second strike came. Filip didn’t see the rock hit. As with the tungsten slugs, it was going much too fast for mere human sight, but he saw the dust-cloud jump like someone had surprised it, and then the vast shockwave, blooming out so powerfully that even in the barely extant atmosphere it was visible.

“Brace,” Filip said, though there was no need. Everyone on the scaffold was already braced. In a thicker atmosphere, it would have been death for all of them. Here, it was little worse than a bad storm. Aaman grunted.

“Problem?” Filip asked.

“Pinché rock holed my foot,” Aaman said. “Hurts.”

Josie answered. “Gratia sa didn’t get your cock, coyo.”

“Not complaining,” Aaman said. “No complaints.”

The scaffold rockets exhausted themselves, the acceleration gravity dropped away. Below them, death had come to the shipyards. There were no lights now. Not even fires burning. Filip turned his gaze to the bright smear of stars, the galactic disk shining on them all. One of those lights wasn’t a star, but the exhaust plume of the *Pella*, coming to collect its wayward crew. Except Chuchu. Except Andrew. Filip wondered why he didn’t feel bad about the loss of two people under his command. His first

command. His proof that he could handle a real mission, with real stakes, and come through clean.

He didn't mean to speak. Maybe he didn't. Maybe it was only a sigh that passed his lips. Miral chuckled.

"No shit, Filipito," the older man said. And then, a moment later, "Feliz cumpleaños, savez?"

Filip Inaros lifted his hands in thanks. It was his fifteenth birthday.

The Lazarus War: Book 1

by Jamie Sawyer

In the twenty-second century, mankind has spread out into the stars, only to find themselves locked in eternal warfare with the insidious Krell. On the farthest edges of known space, a stalemate has been hard won, and a Quarantine Zone is being policed by the only people able to contain the Krell menace: the brave soldiers of the Simulant Operation Program, an elite military team who remotely operate bioengineered avatars in the most dangerous theaters of war.

Captain Conrad Harris is a veteran of the Sim Ops Program, a man who has died hundreds of times running suicide missions inside his simulants. Known as Lazarus, Harris is a man addicted to death, and driven by the memory of a lover lost to the Krell many years before. So when a secret research station deep in the Quarantine Zone suddenly goes dark, there is no other man who could possibly lead a rescue mission.

CHAPTER 1

There was something so immensely *wrong* about the Krell. I could still remember the first time I saw one and the sensation of complete wrongness that overcame me. Over the years, the emotion had settled to a balls-deep paralysis.

This was a primary-form, the lowest strata of the Krell Collective, but it was still bigger than any of us. Encased in the Krell equivalent of battle-armour: hardened carapace plates, fused to the xeno's grey-green skin. It was impossible to say where technology finished and biology began. The thing's back was awash with antenna—those could be used as both weapons and communicators with the rest of the Collective.

The Krell turned its head to acknowledge us. It had a vaguely fish-like face, with a pair of deep bituminous eyes, barbels drooping from its mouth. Beneath the head, a pair of gills rhythmically flexed, puffing out noxious fumes. Those sharkish features had earned them the moniker “fish heads.” Two pairs of arms sprouted from the shoulders—one atrophied, with clawed hands; the other tipped with bony, serrated protrusions—raptorial forearms.

The xeno reared up, and in a split-second it was stomping down the corridor.

I fired my plasma rifle. The first shot exploded the xeno's chest, but it kept coming. The second shot connected with one of the bladed forearms, blowing the limb clean off. Then Blake and Kaminski were firing too—and the corridor was alight with brilliant plasma pulses. The creature collapsed into an incandescent mess.

“You like that much, Olsen?” Kaminski asked. “They're pretty friendly for a species that we're supposed to be at peace with.”

At some point during the attack, Olsen had collapsed to his knees. He sat there for a second, looking down at his gloved hands. His eyes were haunted, his heavy jowls suddenly much older. He shook his head, stumbling to his feet. From the safety of a laboratory, it was easy to think of

the Krell as another intelligent species, just made in the image of a different god. But seeing them up-close, and witnessing their innate need to extinguish the human race, showed them for what they really were.

“This is a live situation now, troopers. Keep together and do this by the drill. *Haven* is awake.”

“Solid copy,” Kaminski muttered.

“We move to secondary objective. Once the generator has been tagged, we retreat down the primary corridor to the APS. Now double time it and move out.”

There was no pause to relay our contact with Jenkins and Martinez. The Krell had a unique ability to sense radio transmissions, even encrypted communications like those we used on the suits, and now that the Collective had awoken all comms were locked down.

As I started off, I activated the wrist-mounted computer incorporated into my suit. *Ah, shit*. The starship corridors brimmed with motion and bio-signs. The place became swathed in shadow and death—every pool of blackness a possible Krell nest.

* * *

Mission timeline: twelve minutes.

We reached the quantum-drive chamber. The huge reinforced doors were emblazoned with warning signs and a red emergency light flashed overhead.

The floor exploded as three more Krell appeared—all chitin shells and claws. Blake went down first, the largest of the Krell dragging him into a service tunnel. He brought his rifle up to fire, but there was too little room for him to manoeuvre in a full combat-suit, and he couldn’t bring the weapon to bear.

“Hold on, Kid!” I hollered, firing at the advancing Krell, trying to get him free.

The other two xenos clambered over him in desperation to get to me. I kicked at several of them, reaching a hand into the mass of bodies to try to grapple Blake. He lost his rifle, and let rip an agonised shout as the creatures dragged him down. It was no good—he was either dead now, or he would be soon. Even in his reinforced ablative plate, those things would

take him apart. I lost the grip on his hand, just as the other Krell broke free of the tunnel mouth.

“Blake’s down!” I yelled. “’Ski—grenade.”

“Solid copy—on it.”

Kaminski armed an incendiary grenade and tossed it into the nest. The grenade skittered down the tunnel, flashing an amber warning-strobe as it went. In the split second before it went off, as I brought my M95 up to fire, I saw that the tunnel was now filled with xenos. Many, many more than we could hope to kill with just our squad.

“Be careful—you could blow a hole in the hull with those explosives!” Olsen warned.

Holing the hull was the least of my worries. The grenade went off, sending Krell in every direction. I turned away from the blast at the last moment, and felt hot shrapnel penetrate my combat-armour—frag lodging itself in my lower back. The suit compensated for the wall of white noise, momentarily dampening my audio.

The M95 auto-sighted prone Krell and I fired without even thinking. Pulse after pulse went into the tunnel, splitting armoured heads and tearing off clawed limbs. Blake was down there, somewhere amongst the tangle of bodies and debris; but it took a good few seconds before my suit informed me that his bio-signs had finally extinguished.

Good journey, Blake.

Kaminski moved behind me. His technical kit was already hooked up to the drive chamber access terminal, running code-cracking algorithms to get us in.

The rest of the team jogged into view. More Krell were now clambering out of the hole in the floor. Martinez and Jenkins added their own rifles to the volley, and assembled outside the drive chamber.

“Glad you could finally make it. Not exactly going to plan down here.”

“Yeah, well, we met some friends on the way,” Jenkins muttered.

“We lost the Kid,” I said. “Blake’s gone.”

“Ah, fuck it,” Jenkins said, shaking her head. She and Blake were close, but she didn’t dwell on his death. *No time for grieving*, the expression on her face said, *because we might be next*.

The access doors creaked open. There was another set of double doors

inside; endorsed QUANTUM DRIVE CHAMBER—AUTHORISED PERSONNEL ONLY.

A calm electronic voice began a looped message: “Warning. Warning. Breach doors to drive chamber are now open. This presents an extreme radiation hazard. Warning. Warning.”

A second too late, my suit bio-sensors began to trill; detecting massive radiation levels. I couldn’t let it concern me. Radiation on an op like this was always a danger, but being killed by the Krell was a more immediate risk. I rattled off a few shots into the shadows, and heard the impact against hard chitin. The things screamed, their voices creating a discordant racket with the alarm system.

Kaminski cracked the inner door, and he and Martinez moved inside. I laid down suppressing fire with Jenkins, falling back slowly as the things tested our defences. It was difficult to make much out in the intermittent light: flashes of a claw, an alien head, then the explosion of plasma as another went down. My suit counted ten, twenty, thirty targets.

“Into the airlock!” Kaminski shouted, and we were all suddenly inside, drenched in sweat and blood.

The drive chamber housed the most complex piece of technology on the ship—the energy core. Once, this might’ve been called the engine room. Now, the device contained within the chamber was so far advanced that it was no longer mechanical. The drive energy core sat in the centre of the room—an ugly-looking metal box, so big that it filled the place, adorned with even more warning signs. This was our objective.

Olsen stole a glance at the chamber, but stuck close to me as we assembled around the machine. Kaminski paused at the control terminal near the door, and sealed the inner lock. Despite the reinforced metal doors, the squealing and shrieking of the Krell was still audible. I knew that they would be through those doors in less than a minute. Then there was the scuttling and scraping overhead. The chamber was supposed to be secure, but these things had probably been on-ship for long enough to know every access corridor and every room. They had the advantage.

They’ll find a way in here soon enough, I thought. A mental image of the dead merchant captain—still strapped to his seat back on the bridge—suddenly came to mind.

The possibility that I would die out here abruptly dawned on me. The

thought triggered a burst of anger—not directed at the Alliance military for sending us out here, nor at the idiot colonists who had flown their ship into the Quarantine Zone, but at the Krell.

My suit didn't take any medical action to compensate for that emotion. *Anger is good.* It was pure and made me focused.

"Jenkins—set the charges."

"Affirmative, Captain."

Jenkins moved to the drive core and began unpacking her kit. She carried three demolition-packs. Each of the big metal discs had a separate control-panel, and was packed with a low-yield nuclear charge.

"Wh—what are you doing?" Olsen stammered.

Jenkins kept working, but shook her head with a smile. "We're going to destroy the generator. You should have read the mission briefing. That was your first mistake."

"Forgetting to bring a gun was his second," Kaminski added.

"We're going to set these charges off," Jenkins muttered, "and the resulting explosion will breach the Q-drive energy core. That'll take out the main deck. The chain reaction will destroy the ship."

"In short: gran explosión," said Martinez.

Kaminski laughed. "There you go again. You know I hate it when you don't speak Standard. Martinez always does this—he gets all excited and starts speaking funny."

"El no habla la lengua," I said. You don't grow up in the Detroit Metro without picking up some of the lingo.

"It's Spanish,," Martinez replied, shooting Kaminski a sideways glance.

"I thought that you were from Venus?" Kaminski said.

Olsen whimpered again. "How can you laugh at a time like this?"

"Because Kaminski is an asshole," Martinez said, without missing a beat.

Kaminski shrugged. "It's war."

Thump. Thump.

"Give us enough time to fall back to the APS," I ordered. "Set the charges with a five minute delay. The rest of you—cállate y trabaja "

"Affirmative."

Thump! Thump! Thump!

They were nearly through now. Welts appeared in the metal door panels.

Jenkins programmed each charge in turn, using magnetic locks to hold them in place on the core outer shielding. Two of the charges were already primed, and she was working on the third. She positioned the charges very deliberately, very carefully, to ensure that each would do maximum damage to the core. If one charge didn't light, then the others would act as a failsafe. There was probably a more technical way of doing this—perhaps hacking the Q-drive directly—but that would take time, and right now that was the one thing that we didn't have.

"Precise as ever," I said to Jenkins.

"It's what I do."

"Feel free to cut some corners; we're on a tight timescale," Kaminski shouted.

"Fuck you, 'Ski."

"Is five minutes going to be enough?" Olsen asked.

I shrugged. "It will have to be. Be prepared for heavy resistance en route, people."

My suit indicated that the Krell were all over the main corridor. They would be in the APS by now, probably waiting for us to fall back.

THUMP! THUMP! THUMP!

"Once the charges are in place, I want a defensive perimeter around that door," I ordered.

"This can't be rushed."

The scraping of claws on metal, from above, was becoming intense. I wondered which defence would be the first to give: whether the Krell would come in through the ceiling or the door.

Kaminski looked back at Jenkins expectantly. Olsen just stood there, his breathing so hard that I could hear him over the communicator.

"... and done!"

The third charge snapped into place. Jenkins was up, with Martinez, and Kaminski was ready at the data terminal. There was noise all around us now, signals swarming on our position. I had no time to dictate a proper strategy for our retreat.

"Jenkins—put down a barrier with your torch. Kaminski—on my mark..."

I dropped my hand, and the doors started to open. The mechanism buckled and groaned in protest. Immediately, the Krell grappled with the

door, slamming into the metal frame to get through.

Stinger-spines—flechette rounds, the Krell equivalent of armour-piercing ammo—showered the room. Three of them punctured my suit; a neat line of black spines protruding from my chest, weeping streamers of blood. *Krell tech is so much more fucked-up than ours.* The spines were poison-tipped and my body was immediately pumped with enough toxins to kill a bull. My suit futilely attempted to compensate by issuing a cocktail of adrenaline and anti-venom.

Martinez flipped another grenade into the horde. The nearest creatures folded over it as it landed, shielding their kin from the explosion. *Mindless fuckers.*

We advanced in formation. Shot after shot poured into the things, but they kept coming. Wave after wave—how many were there on this ship?—thundered into the drive chamber. The doors were suddenly gone. The noise was unbearable—the klaxon, the warnings, a chorus of screams, shrieks and wails. The ringing in my ears didn't stop, as more grenades exploded.

“We’re not going to make this!” Jenkins yelled.

“Stay on it! The APS is just ahead!”

Maybe Jenkins was right, but I wasn't going down without a damned good fight. Somewhere in the chaos, Martinez was torn apart. His body disappeared underneath a mass of them. Jenkins poured on her flamethrower—avenging Martinez in some absurd way. Olsen was crying, his helmet now discarded just like the rest of us.

War is such an equaliser.

I grabbed the nearest Krell with one hand, and snapped it's neck. I fired my plasma rifle on full-auto with the other, just eager to take down as many of them as I could. My HUD suddenly issued another warning—a counter, interminably in decline.

Ten... Nine... Eight... Seven...

Then Jenkins was gone. Her flamer was a beacon and her own blood a fountain amongst the alien bodies. It was difficult to focus on much except for the pain in my chest. My suit reported catastrophic damage in too many places. My heart began a slower, staccato beat.

Six... Five... Four...

My rifle bucked in protest. Even through reinforced gloves, the barrel was burning hot.

Three... Two... One...

* * *

The demo-charges activated.

Breached, the anti-matter core destabilised. The reaction was instantaneous: uncontrolled white and blue energy spilled out. A series of explosions rippled along the ship's spine. She became a white-hot smudge across the blackness of space.

Then she was gone, along with everything inside her.

The Krell did not pause.

They did not even comprehend what had happened.

CORPORAL KEIRA JENKINS (EXPLOSIVES TECH, FIRST GRADE): DECEASED...

WAITING FOR RESPONSE... WAITING FOR RESPONSE... WAITING FOR RESPONSE...

CAPTAIN CONRAD HARRIS: DECEASED...

This was the part I disliked most.

Waking up again was always worse than dying.

I floated inside my simulator-tank—a respirator mask attached to my face—and blinked amniotic fluid from my eyes to read the screen more clearly. The soak stung like a bitch. The words scrolled across a monitor positioned above my tank. Everything was cast a clear, brilliant blue by the liquid filling my simulator.

PURGE CYCLE COMMENCED...

The tank made a hydraulic hissing, and the fluid began to slough out. It was already cooling.

I was instantly smaller and yet heavier. Breathing was a labour. These lungs didn't have the capacity of a simulant's, and I knew that it would take

a few minutes to get used to them again. I caught the reflection on the inside of the plasglass cover, and didn't immediately recognise it as *my* reflection. That was the face I had been born with, and this was the body I had lived inside for forty years. I was naked, jacked directly into the simulator. Cables were plugged into the base of the device, allowing me to control my simulant out there in the depths of space. My bio-rhythms, and those of the rest of my squad, appeared on the same monitor.

All alive and accounted for. Everyone made safe transition.

I had been operating a flesh-and-blood simulation of myself, manufactured from my body tissue. These were called simulants: simulated copies, genetically engineered to be stronger, bigger, faster. Based on the human genome, but accelerated and modified, the sims were the ultimate weapon—more human than human in every sense. Vat-grown, designed for purpose. Now, my simulant was dead. *It* had died on the *New Haven*. *I* was alive.

The background of the book cover is a detailed, high-tech illustration of a futuristic city or space station. On the left, a large, metallic, cylindrical structure with various mechanical details and glowing orange lights is prominent. The right side shows a dense, complex structure with many small lights and intricate details, suggesting a vast, advanced civilization. The overall color palette is dominated by blues, greys, and oranges, creating a sense of depth and technological sophistication.

Prologue: Filip

The twin shipyards of Callisto stood side by side on the hemisphere of the moon that faced permanently away from Jupiter. The sun was only the brightest star in the endless night, the wide smear of the Milky Way brighter by far. All along the ridges of the craters, harsh white work lights glared down onto buildings, loaders, scaffolds. The ribs of half-built ships arced up over the regolith of stone dust and ice. Two shipyards, one civilian and one military, one Earth-based and one owned by Mars. Both protected by the same anti-meteor rail-gun defenses, both dedicated to building and repairing the vessels that would take humanity out to the new worlds beyond the rings when and if the fight on Ilus got worked out.

Both in a lot more trouble than they guessed.

Filip slid forward, the rest of his team close behind him. The suit LEDs had been gouged out, the ceramic plating scoured until nothing was smooth enough to cast a reflection. Even the heads-up display was dimmed almost to the point of invisibility. The voices in Filip's ears—ship traffic, security feeds, civilian chatter—were picked up on passive. He listened while transmitting nothing in return. The targeting laser strapped to his back was powered down. He and his team were shadows among shadows. The faint countdown timer in the left of his visual field passed the fifteen-minute mark. Filip patted air barely thicker than vacuum with an open palm, the Belters' physical idiom to move forward slowly. Around him, his team followed.

High in the void above them, too distant to see, the Martian naval vessels guarding the shipyard spoke in clipped, professional tones. As thinly as their fleet had been stretched, they had only two ships in orbit. Probably only two. It was possible that there were others hidden in the

black, hugging their own waste heat and shielded from radar. Possible but unlikely. And life, as Filip's father said, was risky work.

Fourteen minutes, thirty seconds. Two secondary timers appeared beside it, one with a forty-five second counter, the other with two minutes.

"Transport ship *Frank Aiken*, you are cleared to approach."

"Message received, *Carson Lei*," Cyn's familiar growl came. Filip could hear the old Belter's smile in the words. "Coyos sabe best ai sus bebe come we low?"

Somewhere up there, the *Frank Aiken* was painting the Martian ships with innocuous ranging lasers set at the same frequency as the one strapped to Filip's own back. When the Martian comm officer spoke, there was nothing in his voice that showed fear.

"Don't copy you, *Frank Aiken*. Please repeat."

"Sorry, sorry." Cyn laughed. "You fine upstanding gentlefolk know any good bars a poor Belter crew could get a drink once we get to the surface?"

"Can't help you, *Frank Aiken*," the Martian said. "Maintain course."

"Sabez sa. Solid as a stone, straight as a bullet, us."

Filip's crew topped the crater ridge, looking down at the no-man's-land of the Martian military yard; it was just as he had expected it to be. He picked out the warehouses and supply depots. He pulled off the targeting laser, set the base into the dirty ice, and powered it up. The others, spread along the line wide enough that none of the guards would be out of all their sight lines, did the same. The lasers were old, the tracking platforms strapped to them salvaged from a dozen different sources. Before the tiny red LED on its base turned green, the first of his two secondary timers reached zero.

The security alert tritone sounded on the civilian channel, followed by a woman's anxious voice.

"We've got a runaway loading mech on the field. It's... ah, shit. It's heading for the meteor array."

The panic and alarm cascaded in his ears as Filip moved his team along the rim of the crater. Thin puffs of dust rose around them and didn't fall, widening instead like a mist. The loader mech, failing to respond to overrides, trundled across the no-man's-land and into the wide eyes of the meteor defense cannons, blinding them, if only for a few minutes. Four Martian marines emerged from their bunker, as protocol demanded. Their

powered armor let them slide over the surface like they were skating on ice. Any one of them could kill his whole team and suffer nothing worse than a moment's pity. Filip hated them all and each one individually on principle. The repair crews were already scrambling for the damaged array. The whole thing would be back in order within the hour.

Twelve minutes, forty-five seconds.

Filip paused, looking back at his team. Ten volunteer soldiers, the best the Belt had to offer. Apart from himself, none of them knew why the mission to raid the Martian supply depot was important or what it was leading to. All of them ready to die if he told them to, because of who he was. Because of who his father was. Filip felt it in his belly and in his throat. Not fear, pride. It was pride.

Twelve minutes, thirty-five seconds. Thirty-four. Thirty-three. The lasers they'd placed came to life, painting the four marines, the bunker with the backup team, the perimeter fences, the workshops, and the barracks. The Martians turned, their armor so sensitive that even the gentle caress of invisible beams of light was noticed. As they moved they lifted their weapons. Filip saw one recognize the team, gun shifting away from the lasers and toward them. Toward him.

He caught his breath.

Eighteen days before, a ship—Filip didn't even know which one—out in the Jovian system somewhere had made a hard burn, topping out at ten, maybe fifteen gs. At the nanosecond specified by the computers, the ship had released a few dozen lengths of tungsten with four disposable, short-burn rockets at the center of mass and cheap single-frequency sensors tied to them. They were barely complicated enough to be called machines. Six-year-old children built things more sophisticated every day, but accelerated as they were to one hundred and fifty kilometers per second, they didn't need to be complex. Just shown where to go.

In the time it took for the signal to propagate from Filip's eye, down his optic nerve, and into his visual neocortex, it was over. He was aware of the thump, of the ejecta plumes where the marines had been, of the two brief new stars that had been warships overhead, only after the enemy was dead. He changed his suit radio to active.

"Ichiban," he said, proud that his voice was so calm.

Together, they bounced down the crater's side, shuffling their feet. The

Martian shipyards were like something from a dream, plumes of flame rising from the shattered workshops as the stored volatile gasses vented as fire. Soft snow billowed from the barracks as the released atmosphere sprayed out and froze. The marines were gone, their bodies ripped apart and scattered. A cloud of dust and ice filled the crater, only the guidance of his HUD showing him where the targets were.

Ten minutes, thirteen seconds.

Filip's team divided. Three went to the middle of the open space, finding a place large enough to begin unfolding the thin black carbon structure of the evacuation scaffold. Two others unstrapped recoilless machine pistols, ready to shoot anyone who emerged from the rubble. Two more ran toward the armory, and three came with him, to the supply sheds. The building loomed up from the dust, stark and forbidding. The access doors were shut. A loading mech lay toppled on its side, the driver dead or dying. His tech specialist went to the door controls, prying the housing open with a powered cutting bar.

Nine minutes, seven seconds.

"Josie," Filip said.

"Trabajan, sa sa?" Josie replied curtly.

"I know you're working," Filip said. "If you can't open it—"

The great access doors shifted, shuddered, and rose. Josie turned back and flicked the suit's helmet lights on so that Filip could see the expression on his craggy face. They went into the warehouse. Towers of curved ceramic and steel made great piles, denser than mountains. Hair-thin wire hundreds of kilometers long stood on plastic spools taller than Filip. Massive printers waited, ready to fashion the plates that would fit together over the emptiness, define a volume and make it a bubble of air and water and complex organics that passed for a human environment. Emergency lights flickered, giving the wide space the eerie glow of disaster. He moved forward. He didn't remember drawing his gun, but it was in his hand. Miral, not Josie, was strapping into a loader.

Seven minutes.

The red-and-white strobe of the first emergency vehicles flickered in the chaos of the shipyard, the light coming from everywhere and nowhere. Filip shuffled down the rows of welding rigs and metal printers. Tubs of steel and ceramic dust finer than talcum. Spiral-core mounts. Layers of Kevlar and

foam strike armor piled up like the biggest bed in the solar system. In one open corner of the space, an entire Epstein drive lay disassembled like the universe's most complex jigsaw puzzle. Filip ignored it all.

The air wasn't thick enough to carry the sound of gunfire. His HUD brought up a fast-mover alert in the same moment that a bright patch appeared on the steel beam to his right. Filip dropped, his body seeping down in the microgravity more slowly than it would have under burn. The Martian jumped down the aisle. Not the powered armor of the guards, but a technical exoskeleton. Filip aimed for the center of mass and emptied half his clip. The rounds flared as they left the muzzle, burning their own fuel, tracing lines of fire and red-gray exhaust through the thin Callistan air. Four hit the Martian, and gouts of blood drifted down in a frozen red snowfall. The exoskeleton flipped to emergency alert status, its LEDs turning a grim amber. On some frequency, it was reporting to the yard's emergency services that something terrible had happened. Its mindless devotion to duty was almost funny, in context.

Miral's voice was soft in his ear. "Hoy, Filipito. Sa boîte sa palla?"

It took Filip a moment to find the man. He was in his loader, his blackened vacuum suit becoming one with the huge mech as if they'd been made for each other. Only the dim split circle symbol of the Outer Planets Alliance still just visible beneath the grime marked Miral as anything but an ill-kept Martian mech driver. The canisters he'd been talking about were still lashed to their pallets. A thousand liters each, four of them. On the curving face: High Density Resonance Coating. The energy-absorbent coating helped Martian military ships avoid detection. Stealth tech. He'd found it. A fear he hadn't known he was carrying fell away.

"Yes," Filip said. "That's it."

Four minutes, thirty-seven seconds.

The loading mech's whirring was distant, the sound carried by the vibrations in the structure's flooring more than the thin atmosphere. Filip and Josie moved toward the doors. The flashing lights were brighter, and had taken on a kind of directionality. Filip's suit radio filtered through frequencies crowded with screaming voices and security alerts. The Martian military was ordering back the relief vehicles from the civilian shipyard, concerned that the first responders might be terrorists and enemies in disguise. Which was fair. Under other circumstances, they might have been.

Filip's HUD had the outlines of the buildings, the half-built evac scaffold, its best guess on the locations of the vehicles given IR and light trace data too subtle for Filip's eyes. He felt like he was walking through a schematic drawing, everything defined by edges, all surfaces merely implied. As he shuffled onto the regolith, a deep shudder passed through the ground. A detonation, maybe. Or a building finally completing its long, slow collapse. Miral's loading mech appeared in the open door, backlit by the warehouse lights. The canisters in its claws were anonymous and black. Filip moved toward the scaffold, switching to their encrypted channel as he shuffled.

"Status?"

"Small trouble," Aaman said. He was with the scaffold. Filip's mouth flooded with the metal taste of fear.

"No such thing here, coyo," he said, fighting to sound calm. "What is it?"

"Some of the ejecta crap's fouling the scaffold. I've got grit in the joints."

Three minutes, forty seconds. Thirty-nine.

"I'm coming," Filip said.

Andrew's voice cut in. "We're taking fire in the armory, bosslet."

Filip ignored the diminutive. "How much?"

"Plenty some," Andrew said. "Chuchu's down, and I'm pretty pinned. Might need a hand."

"Hang tight," Filip said, his mind racing. His two guards stood by the evac scaffold, ready to shoot anybody that wasn't them. The three builders were struggling with a brace. Filip jumped over to them, catching himself on the black frame. On the line, Andrew grunted.

Once he saw the stuck connector, black grit fouling it, the problem was clear. In atmosphere, it would have just taken a hard breath to clean it. Not an option here. Aaman was digging frantically with a blade, flipping out tiny bit after tiny bit, trying to empty the thin, complex channels where the metal fit together.

Three minutes.

Aaman hauled the brace into place and tried to force the connection. It was close, very close, but when he tugged back, it came apart. Filip saw the man cursing, flecks of spit dotting the inside of his faceplate. If they'd only brought a can of air, Filip thought...

Which, of course, they had.

He plucked the knife from Aaman's hand and shoved the blade into his suit's wrist where the articulation made it thinnest. A bright pain told him he'd gone just a little too far. That was fine. His suit alarm blinked into place, and he ignored it. He leaned forward, pressing the tiny opening in his suit to the clogged connector, the escaping air scattering the dirt and ice. A single drop of blood spat out, freezing into a perfect crimson sphere and bouncing away from the material. He stepped back, and Aaman slid the connection together. When he tugged this time, it held. The injured suit sealed the hole as soon as he pulled the knife out.

Filip turned back. Miral and Josie had cut the canisters free of their pallets and strapped one to the scaffold. The flashing emergency lights had dimmed, the relief vehicles passing them by in the haze and confusion. Heading, likely, for the firefight at the armory. It was where Filip would have seen the greatest threat too, if he hadn't known better.

"Bosslet," Andrew said, his voice thin and anxious. "Cutting close here."

"No preoccupes," Filip said. "Ge gut."

One of the two guards put a hand on his shoulder. "You want me to go fix that?" she asked. *Should I go save them?*

Filip lifted a fist and shook it gently back and forth. No. She stiffened when she understood what he was saying, and for a moment, he thought she'd disobey. Her choice. Mutiny now was its own punishment. Josie slid the last canister into place, tightened down the straps. Aaman and his people fit the last brace in position.

One minute, twenty seconds.

"Bosslet!" Andrew screamed.

"I'm sorry, Andrew," Filip said. There was a moment of stunned silence and then a stream of obscenity and invective. Filip changed frequencies. The emergency services for the military shipyards were shouting less. A woman's voice speaking crisp, calm German was delivering commands with the almost-bored efficiency of someone well accustomed to crisis, and the voices answering her took their professionalism from hers. Filip pointed to the scaffold. Chuchu and Andrew were dead. Even if they weren't dead, they were dead. Filip pulled himself into his position on the scaffold, fitted the straps around his waist and under his crotch, across his chest, then laid

his head back against the thick padding.

Fifty-seven seconds.

“Niban,” he said.

Nothing happened.

He turned his radio back to the encrypted channel. Andrew was weeping now. Wailing.

“Niban! Andale!” Filip shouted.

The evac scaffold bucked under him, and he suddenly had weight. Four chemical rockets under high burn lit the ground below him, scattering the empty pallets and knocking Miral’s abandoned loading mech on its back. Acceleration pushed the blood down into Filip’s legs, and his vision narrowed. The sounds of the radio grew thinner, more distant, and his consciousness flickered, stuttered. His suit clamped down on his thighs like being squeezed by a giant, forcing the blood back up out of them. His mind returned a bit.

Below, the crater was an oblong blister of dust on the face of the moon. Lights moved in it. The towers at the crater’s edge had gone dark, but flickered now as the systems tried to reboot. The shipyards of Callisto reeled like a drunkard, or a person struck in the head.

The countdown timer slid to two seconds, then one.

At zero, the second strike came. Filip didn’t see the rock hit. As with the tungsten slugs, it was going much too fast for mere human sight, but he saw the dust cloud jump like someone had surprised it, and then the vast shock wave, blooming out so powerfully that even in the barely-extant atmosphere it was visible.

“Brace,” Filip said, though there was no need. Everyone on the scaffold was already braced. In a thicker atmosphere, it would have been death for all of them. Here, it was little worse than a bad storm. Aaman grunted.

“Problem?” Filip asked.

“Pinché rock holed my foot,” Aaman said. “Hurts.”

Josie answered. “Gratia sa didn’t get your cock, coyo.”

“Not complaining,” Aaman said. “No complaints.”

The scaffold rockets exhausted themselves; the acceleration gravity dropped away. Below them, death had come to the shipyards. There were no lights now. Not even fires burning. Filip turned his gaze to the bright smear of stars, the galactic disk shining on them all. One of those lights

wasn't a star, but the exhaust plume of the *Pella*, coming to collect its wayward crew. Except Chuchu. Except Andrew. Filip wondered why he didn't feel bad about the loss of two people under his command. His first command. His proof that he could handle a real mission, with real stakes, and come through clean.

He didn't mean to speak. Maybe he didn't. Maybe it was only a sigh that passed his lips. Miral chuckled.

"No shit, Filipito," the older man said. And then, a moment later, "Feliz cumpleaños, savez?"

Filip Inaros lifted his hands in thanks. It was his fifteenth birthday.

Chapter One: Holden

A year after the Callisto attacks, almost three years after he and his crew had headed out for Ilus, and about six days after they'd gotten back, James Holden floated next to his ship and watched a demolition mech cut her apart. Eight taut cables anchored the *Rocinante* to the walls of her berth. Only one of many in the Tycho Station repair dock, and the repair section was only one of many in the massive construction sphere. Around them in the kilometer-wide volume of the sphere a thousand other projects were going on, but Holden only had eyes for his ship.

The mech finished cutting and pulled off a large section of the outer hull. Beneath lay the skeleton of the ship, sturdy ribs surrounded by a tangled confusion of cabling and conduit, and under that, the second skin of the inner hull.

"Yeah," Fred Johnson said, floating next to him, "you kind of fucked her up."

Fred's words, flattened and distorted by the comm system of their vacuum suits, were still a punch to the gut. That Fred, the nominal leader of the Outer Planets Alliance and one of the three most powerful people in the solar system, was taking a personal interest in his ship's condition should have been reassuring. Instead, Holden felt like he had a father checking over his homework to make sure he hadn't screwed anything up too badly.

"Interior mount's bent," a third voice said over the comm. A sour-faced man named Sakai, the new chief engineer at Tycho after the death of Samantha Rosenberg at what everyone was now calling the Slow Zone Incident. Sakai was monitoring the repairs from his office nearby through the mech's suite of cameras and x-ray scanners.

"How did you do that?" Fred pointed at the rail-gun housing along the

ship's keel. The barrel of the gun ran nearly the entire length of the ship, and the support struts that attached it to the frame were visibly buckling in places.

"So," Holden said, "have I ever told you the one about the time we used the *Roci* to drag a heavy freighter to a higher planetary orbit using our rail gun as a reaction drive?"

"Yeah, that's a good one," Sakai said without humor. "Some of those struts might be fixable, but I'm betting we're going to find enough micro-fracturing in the alloy that replacing them all is the better bet."

Fred whistled. "That won't be cheap."

The OPA leader was the *Rocinante* crew's on-again, off-again patron and sponsor. Holden hoped they were in the on-again phase of the rocky relationship. Without a preferred client discount, the ship's repair was going to get noticeably more expensive. Not that they couldn't afford it.

"Lots of badly patched holes in the outer hull," Sakai continued. "Inner looks okay from here, but we'll go over it with a fine-toothed comb and make sure it's sealed."

Holden started to point out that the trip back from Ilus would have involved a lot more asphyxiation and death if the inner hull hadn't been airtight, but stopped himself. There was no reason to antagonize the man who was now responsible for keeping his ship flying. Holden thought of Sam's impish smile and habit of tempering her criticism with silliness, and felt something clench behind his breastbone. It had been years, but the grief could still sneak up on him.

"Thank you," he said instead.

"This won't be fast," Sakai replied. The mech jetted off to another part of the ship, anchored itself on magnetic feet, and began cutting another section of the outer hull away with a bright flash.

"Let's move to my office," Fred said. "At my age, you can only take an e-suit so long."

Many things about ship repair were made easier by the lack of gravity and atmosphere. The trade-off was forcing technicians to wear environment suits while they worked. Holden took Fred's words to mean the old man needed to pee and hadn't bothered with the condom catheter.

"Okay, let's go."

Fred's office was large for something on a space station, and smelled of old leather and good coffee. The captain's safe on the wall was done in titanium and bruised steel, like a prop from an old movie. The wall screen behind his desk showed a view of three skeletal ships under construction. Their design was large, bulky, and functional. Like sledgehammers. They were the beginnings of a custom built OPA naval fleet. Holden knew why the alliance felt the need to create its own armed defensive force, but given everything that had happened over the past few years, he couldn't help but feel like humanity kept learning the wrong lessons from its traumas.

"Coffee?" Fred asked. At Holden's nod, he began puttering around the coffee station on a side table, fixing two cups. The one he held out to Holden had a faded insignia on it. The split circle of the OPA, worn almost to invisibility.

Holden took it, waved at the screen, and said, "How long?"

"Six months is our current projection," Fred said, then sat in his chair with an old man's grunt. "Might as well be forever. A year and a half from now human social structures in this galaxy will be unrecognizable."

"The diaspora."

"If that's what you want to call it," Fred said with a nod. "I call it the land rush. A whole lot of covered wagons heading for the promised land."

Over a thousand worlds open for the taking. People from every planet and station and rock in the solar system rushing to grab a piece. And back in the home system, three governments racing to build enough warships to control it all.

A welding array flared to life on the skin of one of the ships so brightly that the monitor dimmed in response.

"If Ilus was anything, it was a warning that a lot of people are going to die," Holden said. "Was anyone listening?"

"Not really. You familiar with the land rush in North America?"

"Yeah," Holden said, then took a sip of Fred's coffee. It was delicious. Earth grown, and rich. The privileges of rank. "I got your covered wagon reference. I grew up in Montana, you know. That frontier shit is still the story the people there tell about themselves."

“So you know that the mythology of manifest destiny hides a lot of tragedy. Many of those covered wagons never made it. And more than a few of the people who did wound up as cheap labor for the railroads, mines, and rich farmers.”

Holden drank his coffee and watched the ship construction. “Not to mention all the people who were living there before the covered wagons showed up and gave everyone a nifty new plague. At least our version of galactic destiny doesn’t displace anything more advanced than a mimic lizard.”

Fred nodded. “Maybe. Seems that way so far. But not all thirteen hundred systems have good surveys yet. Who knows what we’ll find.”

“Killer robot things and continent-sized fusion reactors just waiting for someone to flip the switch so they can blow half the planet into space, if memory serves.”

“Based on our sample of one. It could get weirder.”

Holden shrugged and finished off his coffee. Fred was right. There was no way to know what might be waiting on all of those worlds. No telling what dangers lay in store for the would-be colonists rushing to claim them.

“Avasarala isn’t happy with me,” Holden said.

“No, she is not,” Fred agreed. “But I am.”

“Come again?”

“Look, the old lady wanted you to go out there and show everyone in the solar system how bad it all was. Scare them into waiting for the government to tell them it was okay. Put the control back in her hands.”

“It was pretty scary,” Holden said. “Was I not clear on that?”

“Sure. But it was also survivable. And now Ilus is getting ready to send freighters full of lithium ore to the markets here. They’ll be rich. They may wind up being the exception, but by the time everyone figures that out, people will be on all those worlds looking for the next gold mine.”

“Not sure what I could have done differently.”

“Nothing,” Fred agreed. “But Avasarala and Prime Minister Smith on Mars and the rest of the political wonks want to control this. And you’ve made sure they can’t.”

“So why are you happy?”

“Because,” Fred said, his grin wide, “I’m not trying to control it. Which is why I’ll wind up in control of it. I’m playing the long game.”

Holden got up and poured himself another cup of Fred's delicious coffee. "Yeah, you're going to need to parse that for me," he said, leaning against the wall next to the coffee pot.

"I've got Medina Station, a self-sustaining craft that everyone going through the rings has to go past, handing out seed packs and emergency shelters to any ship that needs them. We're selling potting soil and water filters at cost. Any colony that survives is going to do so in part because we helped them. So when it comes time to organize some sort of galactic governing body, who are they going to turn to? The people who want to enforce hegemony at the barrel of a gun? Or the folks who were and are there to help out in a crisis?"

"They turn to you," Holden said. "And that's why you're building ships. You need to look helpful at the beginning when everyone needs help, but when they start looking for a government, you want to look strong."

"Yes," Fred said, leaning back in his chair. "The Outer Planets Alliance has always meant everything past the Belt. That's still true. It's just... expanded a bit."

"It can't be that simple. No way Earth and Mars just sit back and let you run the galaxy because you handed out tents and bag lunches."

"Nothing ever is," Fred admitted. "But that's where we'll start. And as long as I own Medina Station, I control the center of the board."

"Did you actually *read* my report?" Holden asked, not able to keep all the disbelief out of his voice.

"I'm not underestimating the dangers left on those worlds—"

"Forget what got left behind," Holden said. He put down his half-empty coffee cup and stalked across the room to lean across Fred's desk. The old man sat back with a frown. "Forget the robots and railroad systems that still work after being powered down for a billion years or so. The exploding reactors. Forget lethal slugs and microbes that crawl into your eyes and blind you."

"How long is this list?"

Holden ignored him. "The thing you should be remembering is the magic bullet that stopped it all."

"The artifact was a lucky find for you, given what was—"

"No, it wasn't. It was the scariest fucking answer to Fermi's paradox I can think of. Do you know why there aren't any Indians in your Old West

analogy? Because they're already dead. The whatever-they-were that built all that got a head start and used their protomolecule gate builder to kill all the rest. And that's not even the scary part. The really frightening part is that something *else* came along, shot the first guys in the back of the head, and left their corpses scattered across the galaxy. The thing we should be asking is, who fired the magic bullet? And are they going to be okay with us taking all of the victims' stuff?"

Fred had given the crew two suites in the management housing level of Tycho Station's habitation ring. Holden and Naomi shared one, while Alex and Amos lived in the other, though in practice that usually just meant they slept there. When the boys weren't partaking of Tycho's many entertainment options, they seemed to spend all their time in Holden and Naomi's apartment.

When Holden came in, Naomi was sitting in the dining area scrolling through something complex on her hand terminal. She smiled at him without looking up. Alex was sitting on the couch in their living room. The wall screen was on, the graphics and talking heads of a newsfeed playing, but the sound was muted and the pilot's head lay back and his eyes were closed. He snored quietly.

"Now they're sleeping here too?" Holden asked, sitting down across the table from Naomi.

"Amos is picking up dinner. How did your thing go?"

"You want the bad news or the worse news?"

Naomi finally looked up from her work. She cocked her head to one side and narrowed her eyes at him. "Did you get us fired again?"

"Not this time. The *Roci*'s pretty beat up. Sakai says—"

"Twenty-eight weeks," Naomi said.

"Yeah. Have you bugged my terminal?"

"I'm looking at the spreadsheets," she said, pointing at her screen. "Got them an hour ago. He's—Sakai's pretty good."

Not as good as Sam hung in the air between them, unspoken. Naomi looked back down at the table, hiding behind her hair.

“So, yeah, that’s the bad news,” Holden said. “Half a year of downtime, and I’m still waiting for Fred to come out and say that he’s paying for it. Or some of it. Any of it, really.”

“We’re still pretty flush. The UN’s payment came through yesterday.”

Holden nodded the comment away. “But forgetting money for a minute, I still can’t get anyone to listen to me when it comes to the artifact.”

Naomi gave him a Belter shrug of her hands. “Because *this* time it would be different? They’ve never listened before.”

“Just once I’d like to be rewarded for my optimistic view of humanity.”

“I made coffee,” she said, pointing at the kitchen with a tilt of her head.

“Fred gave me some of his, which was good enough that I am ruined for lesser coffees from now on. Yet another way in which my meeting with him was unsatisfying.”

The door to the apartment slid open, and Amos stomped in carrying a pair of large sacks. A curry and onion scent filled the air around him.

“Chow,” he said, then dumped the bags on the table in front of Holden. “Hey, Cap’n, when do I get my ship back?”

“Is that food?” Alex said in a loud, groggy voice from the living room. Amos didn’t answer; he was already taking foam cartons out of the bags and setting them around the table. Holden had thought he was too annoyed to eat, but the spicy smell of Indian food changed his mind.

“Not for a long time,” Naomi said to Amos around a mouthful of bean curd. “We bent the mount.”

“Shit,” Amos said, sitting and grabbing a pair of chopsticks. “I leave you guys alone for a couple weeks and you fuck my girl up.”

“Alien superweapons were used,” Alex said, walking into the room, sleep-sweaty hair standing out from his skull in every direction. “The laws of physics were altered, mistakes were made.”

“Same shit, different day,” Amos replied and handed the pilot a carton of curried rice. “Turn the sound up. That looks like Ilus.”

Naomi turned up the sound on the video feed, and the voice of a newscaster filled the apartment. “—partial power restored, but sources on the ground say this setback will—”

“Is that real chicken?” Alex asked, grabbing at one of the cartons. “Splurging a bit, are we?”

“Shush,” Amos said. “They’re talking about the colony.”

Alex rolled his eyes, but said nothing as he piled spicy strips of chicken on his plate. “—in other news, a draft report detailing the investigation into last year’s attack on the Callisto shipyards was leaked this week. While the text is not finalized, the early reports suggest that a splinter faction of the Outer Planets Alliance was involved, and places blame for the high casualty —”

Amos shut off the sound with an angry stab at the table’s controls. “Shit, wanted to hear more about what’s going on with Ilus, not some dumbass OPA cowboys getting themselves blown up.”

“I wonder if Fred knows who was behind that,” Holden said. “The OPA hardliners are having trouble getting over their ‘us against the solar system’ theology.”

“What did they want there anyway?” Alex said. “Callisto didn’t have any of the heavy munitions. No nukes. Nothing worth a raid like that.”

“Oh, now we’re expecting this shit to make sense?” Amos asked. “Gimme that naan.”

Holden sighed and leaned back in his chair. “I know it makes me a naïve idiot, but after Ilus I actually thought we might get a moment’s peace. No one needing to blow anyone else up.”

“This is what that looks like,” Naomi said, then stifled a burp and put her chopsticks down. “Earth and Mars are in a prickly detente, the legitimate wing of the OPA is governing instead of fighting. The colonists on Ilus are working with the UN instead of everyone shooting each other. This is as good as it gets. Can’t expect everyone to be on the same page. We’re still humans after all. Some percentage of us are always going to be assholes.”

“Truer words were never spoken, boss,” Amos said.

They finished eating and sat in companionable silence for several minutes. Amos pulled beers out of the small refrigerator and handed them around. Alex picked his teeth with his pinky fingernail. Naomi went back to her repair projections.

“So,” she said after a few minutes poring over the numbers, “the good news is that even if the UN and the OPA decide that we’re responsible for our own repair bills, we’ll be able to cover them with just what we have in the ship’s emergency fund.”

“Lots of work flyin’ colonists out through the rings,” Alex said. “When

we're flyin' again."

"Yeah, because we can stuff so much compost in our tiny cargo hold," Amos said with a snort. "Plus, broke-as-hell-and-desperate is maybe not the customer base we should be chasing."

"Let's face it," Holden said, "if things keep going the way they are, finding work for a private warship may get pretty tough."

Amos laughed. "Let me get a preemptive I-told-you-so in here. Since when that turns out not to be true, like it always does, I might not be there to say it."

Chapter Two: Alex

The thing Alex Kamal liked most about the long haul was how it changed the experience of time. The weeks—sometimes months—spent on the burn were like stepping out of history into some small, separate universe. Everything narrowed down to the ship and the people in it. For long stretches, there would be nothing but the basic maintenance work to do, and so life lost all its urgency. Everything was working according to the plan, and the plan was for nothing critical to happen. Traveling through the vacuum of space gave him an irrational sense of peace and well-being. It was why he could do the job.

He'd known other people, usually young men and women, whose experience was different. Back when he'd been in the Navy there had been a pilot who'd done a lot of work in the inner planets, running between Earth, Luna, and Mars. He'd transferred in for a trip out to the Jovian moons under Alex. Just about the time an inner planet run would have ended, the young man started falling apart: getting angry over trivial slights, eating too much or not at all, passing restlessly through the ship from command center to engine room and back again like a tiger pacing its cage. By the time they'd reached Ganymede, the ship's doctor and Alex agreed to start putting sedatives in the guy's food just to keep things from getting out of hand. At the end of the mission, Alex had recommended the pilot never be assigned a long run again. Some kinds of pilots couldn't be trained as much as tested for.

Not that there weren't stresses and worries that he carried with him. Ever since the death of the *Canterbury*, Alex had carried a certain amount of baseline anxiety. With just the four of them, the *Rocinante* was structurally undercrewed. Amos and Holden were two strong masculine

personalities that, if they ever locked horns, could blow the crew dynamic apart. The captain and the XO were lovers, and if they ever broke up, it would mean the end of more than just the job. It was the same sort of thing he'd always worried about, whatever crew he was with. With the *Roci*, it had been the same worries for years now without any of them ever being how it went off the rails, and that in itself was a kind of stability. As it was, Alex always felt relieved to get to the end of a run and he always felt relieved to start the next one. Or if not *always*, at least *usually*.

The arrival at Tycho Station should have been a relief. The *Roci* was as compromised as Alex had ever seen her, and the shipyards at Tycho were some of the best in the system, not to mention the friendliest. The final disposition of their prisoner from New Terra was now soundly someone else's problem, and he was off the ship. The *Edward Israel*, the other half of the New Terran convoy, was burning its way safely sunward. The next six months were nothing but repair work and relaxation. By any rational standard, there should have been less to worry about.

"So what's bugging you?" Amos asked.

Alex shrugged, opened the little food refrigeration unit that the suite provided, closed it, shrugged again.

"Something's sure as shit bugging you."

"I know."

The lights had the yellow-blue clearness that mimicked early morning, but Alex hadn't slept. Or not much. Amos sat at the counter and poured himself a cup of coffee. "We're not doing one of those things where you need me to ask you a bunch of questions so you can get comfortable talking about your feelings, are we?"

Alex laughed. "That never works."

"So let's not do it."

On the burn, Holden and Naomi tended to fold in on each other, not that either of them noticed doing it. It was a natural pattern for lovers to take more comfort in one another than in the rest of the crew. If it had been different, Alex would have been worried about it. But it left him and Amos with mostly one another as company. Alex prided himself on being able to get along with almost anyone on a crew, and Amos was no exception. Amos was a man without subtext. When he said he needed some time alone, it was because he needed some time alone. When Alex asked if he wanted to

come watch the newly downloaded neo-noir films out of Earth that he subscribed to, the answer was always and only a response to the question. There was no sense of backbiting, no social punishment or isolation games. It just was what it was, and that was it. Alex wondered sometimes what would have happened if Amos had been the one to die on the *Donnager*, and he'd spent the last few years with their old medic, Shed Garvey.

It probably wouldn't have gone as well. Or maybe Alex would have adjusted. Hard to know.

"I've been having dreams that... bother me," Alex said.

"Nightmares, like?"

"No. Good dreams. Dreams that are better than the real world. Where I feel bad waking up from them."

"Huh," Amos said thoughtfully and drank his coffee.

"Have you ever had dreams like that?"

"Nope."

"The thing is, Tali's in all of them."

"Tali?"

"Talissa."

"Your ex-wife."

"Yeah," Alex said. "She's always there and things are always... good. I mean, not like we're together. Sometimes I'm back on Mars. Sometimes she's on the ship. She's just present, and we're good, and then I wake up and she's not here and we aren't. And..."

Amos' brow lowered and his mouth rose, squeezing his face into something smaller and thoughtful.

"You want to hook back up with your ex?"

"No, I really don't."

"You horny?"

"No, they're not sex dreams."

"You're on your own, then. That's all I got."

"It started back there," Alex said, meaning on the other side of the rings, orbiting above New Terra. "She came up in conversation, and ever since then... I failed her."

"Yup."

"She spent years waiting on me, and I just wasn't the man I wanted to be."

“Nope. You want some coffee?”

“I really do,” Alex said.

Amos poured a cup for him. The mechanic didn’t add sugar, but knew to leave a third of the cup for cream. One of the little intimacies of crew life.

“I don’t like how I left things with her,” Alex said. It was a simple statement, and not revelation, but it had the weight of a confession.

“Nope,” Amos agreed.

“There’s a part of me that thinks this is a chance.”

“This?”

“The *Roci* being in dry dock for so long. I could go to Mars, see her. Apologize.”

“And then ditch her again in order to get back before the ship drive goes back online?”

Alex looked down into his coffee. “Leave things in a better place.”

Amos’ shrug was massive. “So go.”

A flood of objections crowded his mind. The four of them hadn’t been apart since they’d become a crew, and splitting the group now felt like bad luck. The repair crew on Tycho might need him or want him or make some change to the ship that he wouldn’t know about until it became a critical point somewhere down the line. Or worse, leaving might mean never coming back. If the universe had proved anything in these last few years, it was that nothing was certain.

The chime of a hand terminal saved him. Amos fished the device out of his pocket, looked at it, tapped the screen, and scowled. “I’m going to need a little privacy now.”

“Sure,” Alex said. “Not a problem.”

Outside their suite, Tycho Station stretched in long gentle curves. It was one of the crown jewels of the Outer Planets Alliance. Ceres was larger, and Medina Station held the weird null-zone between rings, but Tycho Station was what the OPA had taken pride in from the start. The wide sweeping lines, more like a sailing ship than any actual craft that she served, weren’t functional. The station’s beauty was a boast. Here are the minds that spun up Eros and Ceres; here is the shipyard that built the largest vessel in the history of humanity. The men and women who, not so many generations ago, had braved the abyss beyond Mars for the first time were smart and powerful enough to make this.

Alex made his way down a long promenade. The people who passed him were Belters, their bodies longer than Earth standard, their heads wider. Alex himself had grown up in the relatively low Martian gravity, but even he didn't quite match the physiology that a childhood rich in null g gave.

Plants grew in the empty spaces of the wide corridors, vines crawling up against the spin gravity as they would have against the normal pull on Earth. Children scampered through the halls, ditching school the way he had back in Londres Nova. He drank his coffee and tried to cultivate the peace of being on the burn. Tycho Station was just as artificial as the *Roci*. The vacuum outside its hull was no more forgiving. But the calm wouldn't come. Tycho Station wasn't his ship, wasn't his home. These people walking past him as he went to the common area and looked up through the massive and multilayered clear ceramic at the glittering spectacle of the shipyards weren't his family. And he kept wondering what Tali would have thought of all this. If she could have come to a place that saw the beauty in it the way he hadn't been able to with the life she'd wanted on Mars.

When he hit the bottom of his cup, he turned back. He ambled along with the flow of foot traffic, making way for the electric carts and exchanging the small, civilized courtesies in the polyglot linguistic catastrophe that was the Belter argot. He didn't think too much about where he was going until he got there.

The *Roci* lay half-dressed in the vacuum. With the outer skin cut away and her inner hull shining fresh in the work lights, she looked small. The scars of their adventures had, for the most part, been borne by the outer hull. Those scars were gone now, and only the deeper injuries remained. He couldn't see them from here, but he knew what they were. He'd been on the *Rocinante* as long as he'd been on any ship in his career, and he loved her better than any of them. Even than his first.

"I'll be back," he said to the ship, and as if in answer, a welding rig lit up at the curve of her drive cone, brighter for a moment than the unshielded sun in a Martian sky.

The suite Naomi and Holden shared was just down the corridor from the

one where he and Amos slept, its door with the same homey fake wood texturing and the number set into the wall just as bright. Alex let himself in, stepping into the conversation already going on.

“—if you think it’s called for,” Naomi said, her voice coming from the suite’s main room. “But I think the evidence is pretty strong that you cleaned the last of that out. I mean, Miller hasn’t been back, has he?”

“No,” Holden said, nodding to Alex. “But just the idea that we had some of that goo in the ship for so long and didn’t even know it creeps me out. Doesn’t it creep you out?”

Alex held out his coffee cup, and Holden took it and filled it automatically. No sugar, room for cream.

“It does,” Naomi said, coming to the kitchen. “Just not enough to take the whole damned bulkhead out over it. The replacements are never as strong as the originals. You know that.”

Alex had met Naomi Nagata back on the *Canterbury*. He could still see the rawboned, angry girl who Captain McDowell had introduced as their new junior engineer. She’d hidden behind her hair for almost a year. Now, she had the first few threads of white among the black. She stood taller, more at home in her own skin. Surer of herself and stronger than he would have guessed she could be. And Holden, the swaggering, self-impressed executive officer who swept into civilian work wearing his dishonorable discharge like a boast had become this man handing him the cream and cheerfully admitting the irrationality of his fears. Time had changed all of them, he supposed. Only he wasn’t sure how he had been affected. Too close to the question, he guessed.

Except Amos. Nothing changed Amos.

“What about you, Alex?”

He grinned and let his Mariner Valley drawl thicken. “Well, shoot, I figure it didn’t kill us when it was here, it ain’t gonna kill us now it’s gone.”

“Fine,” Holden said with a sigh.

“It’ll save us money,” Naomi said, “and we’ll be better off.”

“I know,” Holden said. “But I’m still going to feel weird about it.”

“Where’s Amos?” Naomi asked. “Is he still catting around?”

“No,” Alex said. “He hit the brothels hard enough to burn through his petty cash the first few days in port. Since then, we’ve just been passing the time.”

“We’ll need to find something to keep him busy while we’re on Tycho,” Holden said. “Hell, we’ll need to find something to keep all of us busy.”

“We could look for work on the station,” Naomi said. “I don’t know what they’re hiring for.”

“We’ve got offers from a half-dozen places for paid debriefings on New Terra,” Holden said.

“So does every other person that came back through the Ring,” Naomi said, laughter in her voice. “And the feed there and back still works.”

“You’re saying we shouldn’t do it?” Holden said, his tone vaguely hurt.

“I’m saying I can find a lot of things I’d rather get paid for than talking about myself.”

Holden deflated, just a little. “Fair point. But we’re stuck here for a long time. We’re going to have to do something.”

Alex took a deep breath. Here it was. The moment. His resolve wavered. He poured the cream into the cup, the blackness of the coffee resolving into a gentle tan. The lump in his throat felt as big as an egg.

“So,” he said. “I’ve... ah... I’ve been thinking about things—”

The suite door opened and Amos stepped in. “Hey, Cap’n. I’m gonna need some time off.”

Naomi tilted her head, her brows coming together, but it was Holden who spoke.

“Time off?”

“Yeah, I got to go back to Earth for a little bit.”

Naomi sat at the stool by the breakfast bar. “What’s the matter?”

“Don’t know,” Amos said. “Maybe nothing, but I kinda need to go look to find out. Be sure. You know.”

“Is anything wrong?” Holden asked. “Because if it’s a thing, we can wait for the *Roci* to be fixed up, and we can all go together. I’ve been looking for an excuse to get Naomi back down to Earth so the family can meet her.”

The annoyance that crossed the engineer’s face was almost faster than Alex’s refresh rate. Moments like that made him nervous. The way Holden could push Naomi past her comfort zone and not even know he was doing it. But she recovered even before Amos could speak.

“May have to keep looking for your excuse, Cap. There’s a little time pressure on my thing. Lady I used to spend time with died. I just need to go

make sure everything there's on the up-and-up."

"Oh, I'm so sorry," Naomi said at the same moment Holden said, "Taking care of her estate?"

"Sure, something like that," Amos said. "Anyway, I booked transport to Ceres and then down the well, but I need to cash out some of my shares for spending money while I'm there."

The room went still for a moment. "You're coming back, though," Naomi said.

"Plan to," Amos said. It struck Alex that the answer was more honest than a yes. Amos planned to, but things happened. In all the time they'd spent in all their runs on the *Cant* or the *Roci*, Alex had never heard Amos talk about his life back on Earth except in the most general terms. He wondered if it was because the past wasn't worth mentioning or was too painful to talk about. With Amos, it could have been both at the same time.

"Of course," Holden said. "Just tell me how much you need."

The negotiation was brief, the transfer made on their hand terminals. Amos grinned and slapped Alex on the shoulder.

"All right. You got the place to yourself."

"When are you shipping out?" Alex asked.

"'Bout an hour. I should go get in line."

"All right," Alex said. "Take care of yourself, partner."

"You bet," Amos said and was gone.

The three remaining crewmen of the *Roci* stood silently in the kitchen, Holden looking shocked, Naomi amused. Alex felt like he was about halfway between them.

"Well that was weird," Holden said. "You think he's going to be okay?"

"It's Amos," Naomi said. "I'm more worried about whoever he's going to check on."

"Fair point," Holden said, then hitched himself up to sit on the counter and faced Alex. "Anyway. You were saying you'd been thinking about something?"

Alex nodded. *I was thinking about how hard it is to break up family and about the family I broke up before, and that I need to see my ex-wife again and try to find some sort of resolution to who we were to each other and all the things we did.* Seemed kind of anticlimactic now.

"Well, seeing how we're going to be in dock for a good long time, I was

thinking I might take a trip to Mars. Check in on the old digs.”

“Okay,” Holden said. “But you’ll come back before the repairs are done, right?”

Alex smiled. “Plan to.”

Chapter Three: Naomi

The Golgo table was set for opening throws, the first and second goals untouched and the field still empty. The throbbing bass line from the Blauwe Blome's main room was a vibration in the deck and a murmur that wasn't too loud to talk over. Naomi hefted the steel ball in her hand, feeling the subtle play between mass and weight, different at every gravity. Across from her, Malikah and her teammates from the repair crew waited. One of them was drinking a Blue Meanie, the bright azure fluid staining his mouth like lipstick. It was three years—no, four?—since Naomi had played a game of Golgo, and these people played every Thursday. Naomi hefted the ball again, sighed, and spun it. Instantly, the opposition balls sprang out to hold her short, matching her spin and trying to co-opt her throw.

It was the sort of response you played against a beginner. Naomi was rusty, but she wasn't a beginner. The table registered, ending the throw, and Naomi's marker appeared, well past the field's half mark. Her team cheered, Malikah's groaned. Everyone smiled. It was a friendly game. Not all of them were.

"Next up, next up!" one of Naomi's new teammates shouted, waving his wide, pale hand. His name was Pere or Paar. Something like that. She retrieved the steel ball and tossed it to him. He grinned at her, his eyes only flickering down her body and back. Poor little shit. Naomi stood back, and Malikah moved to stand with her.

"You still got it," Malikah said. She had a beautiful voice, the accents of Ceres Station mellowing the harsher tones of the deep Belt.

"Spent a lot of time playing it when I was here last," Naomi said. "You never forget what you did when you were young, right?"

"Even if you want to." Malikah laughed, and Naomi laughed with her.

Malikah lived in a set of rooms three levels down and thirty degrees spinward from the club. The last time Naomi had been in it, the walls had been draped with silk patterned in brown and gold and the air had been rich with the artificial sandalwood incense that wouldn't clog the air recyclers. Naomi had slept in a bag on the deck for two nights, falling asleep to recorded harp music and the murmuring voices of Malikah and Sam. Only Sam was dead now, and Naomi was back together with Jim, and humanity was heir to a thousand suns within a two-year burn. Being there, laughing with Malikah and the repair crews, Naomi couldn't tell if she was more astounded by how much things had changed or how little.

Malikah touched Naomi's shoulder, her brow furrowed. "Bist ajá?"

"Was thinking," Naomi said, falling into the rhythm of Belter slang only roughly. Golgo wasn't the only thing she was rusty with.

Malikah's mouth turned down at the corners even as the Golgo table erupted in shouts of glee and dismay. For a moment, Sam was there too. Not the actual woman with her red hair and cheerful obscenity and habit of using childish terms—boo-boo, owie—to describe things like meteoroid-breached hulls. Only the space where she had been, and the two women sharing the knowledge that someone was missing.

Paar-or-Pere passed the ball on to the next player—Sakai, the new chief engineer—while the opposing team clapped him mockingly on the back. Naomi moved forward to assess the damage. Being around Belters—just Belters—was weirdly comforting. She loved her crew, but they were two Earthers and a Martian. There were some conversations that she could never have with them.

She could tell when Jim arrived without turning around. The players across the table from her all looked past her as one. Their eyes went wide, and an air of excitement washed over them. No one said it, but they might as well have—*Hey! Look! It's James Holden!*

It was easy to forget that Jim was who he was. He'd started two wars, and played some role in ending them both. He'd captained the first human ship through the Ring, or the first one that survived anyway. He'd been on the alien base in the center of the slow zone and come back. He'd survived Eros Station and the death of the *Agatha King*. He'd been to New Terra, the first human colony on a nonhuman planet, and forged a weird, awkward peace there. It was almost embarrassing, seeing everyone react to that

Holden: the one on the screens and in the newsfeeds. She knew Jim was nothing like that James Holden, but there was no point saying it. Some things stayed secrets even when you told them.

“Hello my love,” Jim said, putting his arm around her. In his other hand, he had a grapefruit martini.

“For me?” she said, taking the cocktail.

“Hope so. I wouldn’t drink it on a dare.”

“Hoy, coyo!” Paar-or-Pere said, holding up the steel ball. “Want a throw?”

The laughter around the table was buoyant. Some of it was delight—*James Holden playing Golgo with us!*—and some was cruel—*Watch the big shot suck*. None of it had anything to do with the actual man. She wondered if he knew how much he changed the nature of a room just by walking into it. At a guess, he probably didn’t.

“No,” Jim said with a grin. “I’m terrible at this. Wouldn’t know where to start.”

Naomi leaned in toward Malikah. “I should go. Thank you so much for having me.” It meant *I am grateful to you for letting me be here with other Belters like I belong*.

“You are todamas welcome, coya-mis,” Malikah said. It meant, *Sam’s death wasn’t your fault, and if it was I forgive you*.

Naomi took Jim’s elbow and let him steer her out to the main bar. The music rose as they passed through the doorway, light and sound joining in a sensory assault. On the dance floor, people moved together in pairs or in groups. There had been a time, long before she’d met Jim, when the idea of getting very, very drunk and throwing herself into the press of bodies would have been an attractive one. She could remember the girl she used to be with fondness, but it wasn’t a youth she cared to recapture. She stood at the bar and finished her martini. It was too loud to talk, so she amused herself watching people notice Jim, the game of is-it-or-isn’t-it in their expressions. Jim, for his part, was amiably bored. The idea that he was the center of attention was foreign to him. It was part of what she loved about him.

When her glass was empty, she put her hand on his, and they pressed out to the public corridor outside the club. Men and women waiting to get in—Belters, almost to a person—watched them leave. It was night on Tycho Station, which didn’t mean much. The station was built on three rotating

eight-hour shifts: leisure, work, sleep. Who you knew depended on what shift you worked, like three different cities that all occupied the same space. A world that would always be two-thirds strangers. She put her arm around Jim's waist and pulled him in against her until she could feel his thigh moving against hers.

"We need to talk," she said.

He tensed a little, but kept his voice light and airy. "Like man-and-woman talk?"

"Worse," she said. "XO and captain."

"What's up?"

They stepped into a lift, and she pushed the button for their deck. The lift chimed, the doors moving gently closed, as she gathered her thoughts. It wasn't really that she didn't know what needed to be said. He wasn't going to like this any more than she did.

"We need to look at hiring on more crew."

She knew enough about Jim's silences to recognize this one. She looked up into his blank expression, his eyes blinking a fraction more quickly than usual.

"Really?" he said. "Seems to me that we're doing just fine."

"We are. We have been. The *Roci*'s a military design. Smart. A lot of automation, a lot of redundancy. That's why we've been able to run her at a third of her standard crew for this long."

"That and we're the best damned crew in the sky."

"That doesn't hurt. Looking at skills and service, we've got a strong group. But we're brittle."

The lift shifted, the complex forces of station spin and car acceleration making the space feel unsteady. She was sure it was just the movement.

"I'm not sure what you mean by brittle," Jim said.

"We've been on the *Rocinante* since we salvaged her off the *Donnager*. We've had no change in staff. No turnover. Name me one other ship you can think of where that's true. There were runs where the *Canterbury* had a quarter of the staff on their first mission together. And..."

The doors slid open. They stepped out, moving aside to let another couple go in. Naomi heard the others murmuring to each other as the lift doors closed. Jim was quiet as they walked back toward their suite. When he finally spoke, his voice was low and thoughtful.

“You’re thinking one of them may not come back? Amos? Alex?”

“I’m thinking that a lot of things happen. Take a high burn, and sometimes people stroke out. The juice helps, but it’s not a guarantee. People have been known to shoot at us. Or we’ve been disabled in a decaying orbit. You remember all that happening, right?”

“Sure, but—”

“If we lose someone, we go from running at a third of a standard crew to a quarter. Add to that the loss of nonredundant skills.”

Holden stopped, his hand on the door to their rooms.

“Wait, wait, wait. If we lose someone?”

“Yes.”

His eyes were wide and shocked. Little wrinkles of distress gathered at the corners. She reached up to smooth them away, but they didn’t go.

“So you’re trying to get me prepared for one of my crew dying?”

“Historically speaking, humans are pretty much at a hundred percent on that.”

Jim started to say something, faltered, opened the suite door, and walked in. She followed, closing the door behind them. She wanted to let it drop, but if she did, she didn’t know when they’d pick it back up.

“If we were running a traditional crew, we’d have two people in every position. If anyone got killed or disabled, someone else would be right there to step in.”

“I’m not adding four more people to our ship, much less eight,” Jim said, walking into the bedroom. Running from the conversation. He wouldn’t actually leave. She waited for the silence and the distress and the worry that he’d made her angry to pull him back. It took about fifteen seconds. “We don’t run this like a regular crew because we’re not a regular crew. We got the *Roci* when everyone in the system was shooting at us. We had stealth ships blowing a battleship out from under us. We lost the *Cant* and then we lost *Shed*. You can’t go through that and just be normal.”

“Meaning what exactly?”

“This ship isn’t a crew. We don’t *run* it like a crew. We run it like a family.”

“Right,” she said. “And that’s a problem.”

They looked at each other across the room. Jim’s jaw worked, objections and arguments getting stalled at his tongue. He knew she was right, and he

wanted her to be wrong. She saw him realize there was no way out.

“Fine,” he said. “When the others get back, let’s talk about doing some interviews. Taking a couple people on for a mission or two. If they shake down right, we can look at keeping them on permanently.”

“That sounds good,” Naomi said.

“It’s going to change the balance on the ship,” Holden said.

“Everything changes,” she said, putting her arms around him.

They ordered food from a fusion Indian restaurant, curry and genetically modified rice and textured fungal protein mostly indistinguishable from beef. For the rest of the evening, Holden tried to be cheerful, tried to hide his unease from her. It didn’t even start to work, but she appreciated the effort.

After dinner, they watched the entertainment feeds until the time came in the comfortable rhythm of their day that she turned off the screen and drew him back to the bed. Sex with Holden had started off as a thrilling thing, years ago when they were first seeing exactly how stupid a captain and an XO sleeping together would be. Now, it was richer and calmer and more playful. And more comforting.

After, lying on the big gel-form mattress with the sheets in ropes at the foot, Naomi’s mind wandered. She thought of the *Roci* and of Sam, of a book of poetry she’d read when she was a girl and a musical group one of the senior engineers had roped her into on the *Canterbury*. Her recollections had started taking on the surreal confusion of dreams when Jim’s voice brought her back almost to wakefulness.

“I don’t like having them gone.”

“Hmm?”

“Alex and Amos. I don’t like having them gone. If they get in trouble, we’ll be here. I can’t even just fire up the *Roci* and go get them.”

“They’ll be fine,” she said.

“I know. I sort of know.” He propped himself up on one elbow. “Are you really not worried?”

“A little maybe.”

“I mean, I know they’re grown-ups, but if something happened. If they didn’t come back...”

“It would be hard,” Naomi said. “We four have been what we rely on for a lot of years now.”

“Yeah,” Jim said. And then a moment later, “Do you know who this lady was Amos went back to check on?”

“No. I don’t.”

“You think she was his lover?”

“I don’t know,” Naomi said. “I got the feeling it was more of a surrogate mom thing.”

“Hmm. Maybe. I don’t know why I was thinking lover.” His voice had started taking on the fuzzy edges of sleep. “Hey, can I ask an inappropriate question?”

“If memory serves.”

“Why didn’t you and Amos ever get together? I mean back on the *Cant*.”

Naomi laughed, rolled over, put her arm across his chest. Even after shipping with him all this time, she liked the way his skin smelled. “Are you serious? Have you paid any attention at all to his sexuality?”

“I don’t think Amos and I are supposed to do that.”

“It’s not a place you want to be,” Naomi said.

“Hmm. Okay. I was just thinking, you know. How much he followed you around back on the *Cant*. And he’s never talked about leaving the *Roci*.”

“He’s not staying on the *Roci* for me,” Naomi said. “He’s staying for you.”

“Me?”

“He’s using you as his external, aftermarket conscience.”

“No, he’s not.”

“It’s what he does. Finds someone who has a sense of ethics and follows their lead,” Naomi said. “It’s how he tries not to be a monster.”

“Why would he try not to be a monster?” The sleep-slurred words were like a blanket.

“Because he is one,” Naomi said, her consciousness flickering across the line. *It’s why we get along.*

The message came two days later, and without warning. Naomi was in an

EVA suit, inspecting the work with Chief Engineer Sakai. He was in the process of explaining why they were looking at a different ceramic alloy for the connections between inner and outer hull when a priority message popped into her HUD. She felt a rush of fear, the aftermath of her talk with Holden. Something had happened to Alex. Or Amos.

“Hold on,” she said, and Sakai answered with a raised fist.

She started the message. A flat transmission screen popped on with the split circle of the OPA, and when it flickered away, Marco was there. The years had thickened his face a degree, softened the curve of his jaw. His skin had the same richness and depth she remembered, and his hands, folded on the table wherever he’d recorded this, were as delicate. He smiled with the mixture of sorrow and amusement that was like falling backward through time.

The message halted, cut off by the suit’s medical systems. Warnings for increased heart rate, elevated blood pressure. She chinned the override, and his voice stuttered softly into her ears, smoothing as the feed cohered.

“I’m sorry. I know you don’t want to hear from me. If it helps, I’d just point out that I haven’t done it before this. And I’m not doing it lightly now.”

Shut it off, she thought. Stop the feed. Erase it. It would all be lies anyway. Lies or only what parts of the truth served him. Forget it ever came. Marco looked away from the camera as if he’d read her mind, or known what she would be thinking.

“Naomi, I don’t agree with your decision to leave, but I’ve always respected it. Even when you showed up in the news so everyone knew where you were, I didn’t reach out. And I’m not coming to you now for myself.”

The words were all crisp and warm and careful: the flawless grammar of someone speaking a second language so well it sounded uncanny. He had none of his Belter patois. So there was another way the years had changed him.

“Cyn and Karal send their love and respect, but they’re the only ones who know I’m reaching out. And why. They’re on Ceres Station right now, but they can’t stay long. I need you to meet their team there and—No. I’m sorry. That’s wrong. I shouldn’t have put it that way. It’s just that I’m at loose ends. I don’t know what to do, and you’re the only one I can turn to.

It's Filip. He's in trouble."

Chapter Four: Amos

His throat ached.

Amos swallowed, trying to force the lump away with a mouthful of saliva, but all that got him was a thick new pain like swallowing sand. The *Roci*'s med bay had shot him full of all the booster vaccines and bacterial prophylactics three months ago, right on schedule. He didn't figure he could be sick. But there it was, a spot in the back of his throat that felt like he'd swallowed a golf ball and it got stuck halfway down.

All around him, the citizens and travelers of the Ceres Station Spaceport milled like ants on their hill, their voices making an undifferentiated roar that was just as good as silence. It amused Amos that this metaphor was one that no one on Ceres would actually understand. Himself, he hadn't seen an ant in close on two decades, but the childhood memories of watching them take down a cockroach or clean the carcass of a rat were vivid and sharp. Like the roaches and the rats, ants had learned to live with their human neighbors without much trouble. When the concrete of human cities spread across the globe and half the animals on Earth were on endangered lists, no one had worried about the ants. They were doing fine, thanks, and spilled fast food was just as plentiful and delicious as dead forest animals had once been.

Adapt or die.

If Amos could be said to have a philosophy, it would be that. The concrete replaces the forest. You get in its way, you get paved over. If you can find a way to live in the cracks, you can thrive anywhere. There were always cracks.

The anthill of Ceres bustled around him. There were people at the top of the food chain buying snacks at the kiosks or tickets for the shuttles and

long-flight ships leaving the station. The people in the cracks were there too. A girl no older than ten with long dirty hair and a pink jumpsuit two sizes too small eyed the travelers without staring at them. Waiting for someone to set their luggage or their hand terminal down long enough to be snatched away. She saw Amos looking at her and bolted for a maintenance hatch set low in the wall.

Living in the cracks, but living. Adapting, not dying.

He swallowed again, grimacing at the ache. His hand terminal beeped, and he looked up at the flight board that dominated the station's public space. Bright yellow letters against black, a font designed for legibility over beauty. His long-haul flight to Luna was confirmed for a launch window in three hours. He tapped on his terminal's screen to let the automated system know he'd be on board when it left, and walked off looking for something to kill three hours.

There was a bar by the gate. So that was easy.

He didn't want to get drunk and miss his flight, so he stuck to beer, drinking slowly and methodically and waving at the bartender as he approached the bottom of one glass so that the next was waiting when he finished. He was aiming for fuzzy and relaxed, and he knew exactly how to get there in the shortest possible time.

The bar didn't offer much in the way of entertainments or distractions, so he could focus on the glass, the bartender, the next drink. The lump in his throat thickened with each swallow. He ignored it. The other patrons in the bar were quiet, reading hand terminals or whispering in small groups as they drank. Everyone on the way to somewhere else. This place wasn't a destination; it was something you bumped into in your travels, accidental and forgettable.

Lydia was dead.

He'd spent twenty years thinking about her. The tattoo of her face over his heart was some of that, of course. Every look in a mirror without his shirt on was a reminder. But beyond that, every day had choices in it. And every choice he made started with the little voice in his head asking what Lydia would want him to do. When he'd received the message from Erich, he realized he hadn't seen or spoken to her in over two decades. That meant she was twenty years older than when he'd left. How old had she been then? He could remember the gray in her hair, the lines around her eyes and

mouth. Older than him. But he'd been fifteen, and "older than him" had been a wide space most people fell into.

And now she was dead.

Maybe someone twenty years older than the woman he remembered was old enough to die of natural causes. Maybe she'd died in a hospital, or her own bed, warm and comfortable and surrounded by friends. Maybe she'd had a cat sleeping on her feet. Amos hoped that was true. Because if it wasn't—if it was anything *other* than natural causes—he was going to kill every single person even remotely involved. He examined the idea in his mind, rotating it this way and that, waiting to see if Lydia stopped him. He took another long swallow of beer and burned his throat. He really hoped he wasn't getting sick.

You're not sick, Lydia's voice said in his mind, you're sad. Grieving. The lump in your throat. The hollow space behind your sternum. The empty feeling in your stomach no matter how much beer you put there. That's grief.

"Huh," Amos said out loud.

"Need something, buddy?" the bartender asked with professional disinterest.

"Another," Amos said, pointing at the half-full beer he still had.

You don't process grief well, another voice said. Holden, this time. That was the truth. That's why Amos trusted the captain. When he said something, it was because he believed it. No need to analyze it or figure out what he really meant by it. Even when the captain fucked up, he was acting in good faith. Amos hadn't met many people like that.

The only really strong emotion Amos had felt in longer than he could remember was anger. That was always there, waiting for him. Processing his grief that way was simple and direct. He understood it. The man sitting a few stools away at the bar had the rough, rawboned look of a rock jock. He'd been nursing the same beer for an hour. Every time Amos ordered another, the man shot him a glance that was half annoyance, half envy. Coveting his apparently bottomless credit account. It would be so easy. Say something to him, cutting and loud, put him in a position where backing down embarrassed him in front of everyone. The poor fucker would feel obligated to take the bait, and then Amos would be free to process his grief all over the guy. Some time in stir might even be a nice way to unwind.

That guy didn't kill Lydia, Holden's voice said. *But maybe someone else did*, Amos thought. *And I need to find out.*

"Need to cash out here, amigo," Amos said to the bartender, waving his hand terminal at him. He pointed at the rock jock. "Put that guy's next two on my tab."

The rock jock frowned, looking for the insult, but when he couldn't find it he said, "Thanks, brother."

"Anytime, hermano. You be safe out there."

"Sa sa," the jock said, finishing off his beer and reaching for one of the two Amos had just bought. "Do the same, sabe dui?"

Amos missed his bunk on the *Roci*.

The long-haul transport was named the *Lazy Songbird*, but its birdlike qualities began and ended at the white letters painted on its side. From the outside, it looked like a giant garbage can with a drive cone on one end and a tiny ops deck on the other. From the inside, it looked like the inside of a giant garbage can except that it was divided into twelve decks, fifty people to a deck.

The only privacy to be had was thin curtains in the shower stalls, and people only ever seemed to use the head when uniformed crew members were around.

Ah, Amos thought, *Prison rules*.

He selected a bunk, just a crash couch with a little storage under it and a tiny entertainment screen on the bulkhead next to it, as far from the head and the commissary as possible. He tried to stay out of high traffic areas. The people sharing his space were a family of three on one side, and an ancient crone on the other.

The crone spent the entire flight high on little white pills, staring at the ceiling all day and tossing and sweating through fever dreams all night. Amos introduced himself to her. She offered him some pills. He declined. This ended their association.

The family on the other side was much nicer. Two men in their early thirties and their daughter of about seven. One of the men was a structural

engineer named Rico. The other a stay-at-home dad called Jianguo. The girl's name was Wendy. They eyed Amos with some suspicion when he first claimed the bunk, but he smiled and shook their hands and bought Wendy an ice cream bar from a commissary vending machine and then didn't follow up by being creepy. He knew what men who had too much interest in little kids were like, and so he knew how not to ever be mistaken for one of them.

Rico was traveling to Luna to take one of the new job openings at the Bush orbital shipyards. "Lots of coyos heading downwell. Beaucoup jobs now, everybody trying to grab a ring for themselves. New colonies. New worlds."

"That'll dry up when the rush dies down," Amos said. He was lying back on his couch, half listening to Rico rattle on, half watching a video feed on his wall screen with the sound off.

Rico gave a Belter shrug of the hands and tilted his head toward his daughter, sleeping in her bunk. "For her, sabe? Later is for later. For now I put some yuan aside. School, ring trip, whatever she needs."

"I hear that. Later is later."

"Oh, hey, they're cleaning the head. Gonna grab a shower."

"What's with that, man?" Amos asked. "What's the rumpus?"

Rico cocked his head, like Amos had asked why space was a vacuum. In fairness, Amos knew the answer, but it was interesting to see whether Rico did too. "Long-haul gangs, coyo. Price of flying on the cheap. Sucks to be poor."

"The crew watches for that shit, right? Anyone gets in a tussle, they gas us all, tie up the perps. No fuss, no muss."

"Don't watch the showers. No cameras. If you don't pay when the shakedown comes, that's where they get you. Better to go when crew is around."

"No shit," Amos said, pretending surprise. "Haven't seen the shakedown yet."

"You will, hombre. Watch Jian and Wendy while I'm out, yeah?"

"Both eyes, brother."

Rico was right. After the first rush of the flight, when the initial bustle of people finding bunks, deciding they hated their neighbor, then finding a new one was over, people were mostly settled in. The Belters bunking on Belter decks. The inners on decks split between Earth and Mars. Amos was on a Belter deck, but he seemed to be the only one mixing.

Prison rules for sure.

On the sixth day, a small group of toughs from a deck up came down the lift together and fanned out through the compartment. With fifty people on the deck, it took them a while to hit everyone. Amos pretended to sleep in his crash couch and watched them out of the corner of his eye. It was a basic scam. A tough walked up to a passenger, explained about in-flight insurance policies, then took a credit transfer with a cheap disposable terminal. All the threats were implied. Everyone paid. It was a stupid racket, but simple enough that it worked anyway.

One of the extortionists who looked like he wasn't a day over fourteen headed their direction. Rico started to pull out his hand terminal, but Amos sat up in bed and waved him off. To the junior extortionist he said, "We're all good over here. No one in this corner pays."

The thug stared at him without speaking. Amos smiled back. He didn't particularly want to be gassed and tied up, but if that's how it had to happen, he'd live with it.

"Dead man," the thug said. He put as much macho as he could into it, and Amos respected the commitment. But much scarier people than a skinny pubescent Belter had tried intimidating him. Amos nodded as if considering the threat.

"So there was this one time I got caught in a reactor crawlspace when a coolant pipe blew," he said.

"What?" the kid asked, baffled. Even Rico and Jianguo were looking at Amos like he'd lost his mind. Amos shifted, and the couch's gimbals squeaked as they reoriented.

"See, the coolant is radioactive as fuck. Hits the open air and it vaporizes. Getting it on your skin ain't good for you, but you can survive that. Washes off, mostly. You don't want to breathe it in though. Get a bunch of radioactive particles down in the lungs where you can't get 'em out? Yeah, you pretty much melt from the inside."

The kid glanced over his shoulder, looking for support dealing with the

crazy ranting guy. The rest of team extortion was still busy.

“So,” Amos continued, leaning forward, “I had to get into a maintenance airlock, open an emergency locker, and get a rebreather strapped to my face without breathing any of that shit in.”

“So what? You still—”

“The point of this little tale of woe is that I learned some facts about myself.”

“Yeah?” The situation had gotten weird enough that the kid actually seemed interested in finding out.

“I learned that I can hold my breath for almost two minutes while engaging in stressful physical activity.”

“So—”

“So you need to ask yourself, how much damage can I do to you in two minutes before the knockout gas gets me. Because I’m betting it’s a lot.”

The kid didn’t respond. Rico and Jianguo seemed to be holding their breath. Wendy was staring at Amos with a wide-eyed grin.

“There a problem?” One of the junior thug’s buddies had finally come over to check on him.

“Yeah, he—”

“No problem,” Amos said. “Just explaining to your associate here that this corner of the room doesn’t pay for insurance.”

“Says you?”

“Yeah. Says me.”

The senior thug looked Amos over, sizing him up. They were about the same height, but Amos outweighed him by a solid twenty-five kilos. Amos stood up and spread himself out a little, making the point.

“What crew you run with?” senior thug asked, mistaking him for a rival banger.

“*Rocinante*,” Amos replied.

“Never heard of ’em.”

“Yeah, you have, but context is everything, ain’t it?”

“Might be you fucked up, coyo,” the thug said.

Amos gave an expansive Belter shrug of the hands. “I guess we’ll find out sooner or later.”

“Sooner or later,” the thug agreed, then grabbed his junior partner and headed off to the rest of his crew. When they took the lift to the next deck,

they left junior behind. He openly stared at Amos from across the room, not trying to hide anything.

Amos sighed and grabbed his towel out of his duffel. "Gonna go take a shower."

"You crazy," Jianguo said. "No crew in there. They'll jump you."

"Yep."

"Then why?"

"Because," Amos said, standing up and throwing the towel over his shoulder, "I hate waiting."

As soon as Amos walked toward the head with his prominently displayed towel, junior started talking on his hand terminal. Calling the troops.

The head was five flimsy sheet plastic shower stalls against one bulkhead, and ten vacuum flush toilets against the other. Sinks lined the bulkhead directly across from the door. The open space in the middle had benches for sitting while you waited your turn in the shower or dressed afterward. Not the best space for hand-to-hand. Lots of hard projections to get mashed into, and the benches were a tripping hazard.

Amos tossed his towel onto a sink and leaned against it, arms crossed. He didn't have to wait long. A few minutes after junior had made the call he and five of the thugs from team extortion filed into the room.

"Only six? I'm a little insulted."

"You not a little anything," the oldest one said. The leader then, speaking first. "But big dies too."

"True that. So how does this go? I'm on your turf, so I'll respect the house rules."

The leader laughed. "You funny, man. Dead soon, but funny." He turned to junior thug and said, "Your beef, coyo."

Junior pulled a shiv out of his pocket. No weapons made it into the passenger compartment through security, but this was a jagged piece of metal torn off of something in the ship then sharpened down. Prison rules, again.

"I'm not going to disrespect you," Amos said to him. "I killed my first guy at about your age. Well, a few guys really, but that's not the issue. I know to take you and that knife seriously."

"Good."

“No,” Amos said sadly, “it really isn’t.”

Before anyone could move, Amos crossed the space between them and grabbed junior’s knife arm. The ship was only at about a third of a g thrust, so Amos yanked the kid off the floor and spun, hitting the edge of a shower stall with the kid’s arm. His body kept traveling and Amos didn’t let go, so the arm folded around the impact point. The sound of tendons in his elbow snapping was like hitting wet plywood with a hammer. The knife drifted to the floor from nerveless fingers, and Amos let go of the arm.

There was a long second where the five thugs stared at the knife on the floor at Amos’ feet, and he stared back at them. The emptiness in his belly was gone. The hollow space behind his sternum, gone. His throat had stopped hurting.

“Who’s next?” he said, flexing his hands, his face in a grin he didn’t know he had.

They came in a rush. Amos spread his arms and welcomed them like long-lost lovers.

“You okay?” Rico asked. He was dabbing at a small cut on Amos’ head with an alcohol swab.

“Mostly.”

“They okay?”

“Less so,” Amos said, “but still mostly. Everyone will walk out of there when they wake up.”

“You didn’t have to do that for me. I would have paid.”

“Didn’t,” Amos said. At Rico’s puzzled look he added, “Didn’t do it for you. And Rico? That money goes into the Wendy fund, or I come looking for you too.”

Chapter Five: Holden

One of Holden's grandfathers had spent his youth riding in rodeos. All of the pictures they had of him were of a tall, muscular, robust-looking man with a big belt buckle and a cowboy hat. But the man Holden had known when he was a child was thin, pale, and hunched over. As if the years had stripped away everything extraneous and rendered the younger man down into the skeletal older man he became.

It struck him that Fred Johnson had been rendered.

He was still a tall man, but the heavy muscles he'd once had were mostly gone, leaving loose skin at the backs of his arms and on his neck. His hair had gone from mostly black to mostly gray to mostly not there at all. That he could still project an air of absolute authority meant that very little of it had come from his physicality in the first place.

Fred had two glasses and a bottle of something dark on the desk when Holden sat. He offered a drink with a small tilt of his head, and Holden accepted with a nod. While Fred poured, Holden leaned back in his chair with a long sigh, then said, "Thank you."

Fred shrugged. "I was looking for an excuse."

"Not the drink, but thanks for that too. Thank you for helping with the *Roci*. The money from Avasarala came, but we have damage we didn't know about when I wrote the bill. Without our favored client discount, we'd been in trouble."

"Who says you're getting a discount?" Fred said as he handed Holden the drink, but he smiled as he said it. He sank into his own chair with a grunt. Holden hadn't realized coming in how much he was dreading the conversation. Even if he knew it was just good business negotiation, it felt like asking for a handout. That the answer had been yes was good. That

Fred hadn't made him squirm about it was even better. Made him feel more like he was sitting with a friend.

"You look old, Fred."

"I feel old. But it's better than the alternative."

Holden raised his glass. "Those who aren't with us."

"Those who aren't with us," Fred repeated, and they both drank. "That list is getting longer every time I see you."

"I'm sorry about Bull, but I think he may have saved the solar system. From what I knew of him, he'd think that was pretty kick-ass."

"Bull," Fred said, raising his glass again.

"And Sam," Holden added, raising his own.

"I'm leaving soon, so I wanted to check in with you."

"Wait. Leaving? Like leaving leaving, or like Bull and Sam leaving?"

"You're not rid of me yet. I need to get back out to Medina Station," Fred said. He poured himself a little more bourbon, frowning down at the glass like it was a delicate operation. "That's where all the action is."

"Really? I thought I heard something about the UN secretary-general and the Martian prime minister having a sit-down. I thought you'd be heading to that."

"They can talk all they want. The real power's in the geography. Medina's in the hub where all the rings connect. That's where the power is going to be for a good long time."

"How long do you think the UN and Mars keep letting you run that show? You have a head start, but they have a bunch of really dangerous ships to throw at you if they decide they want your stuff."

"Avasarala and I are back channeling a lot of this. We'll keep it from getting out of hand." Fred paused to take a long drink. "But we have two big problems."

Holden put down the glass. He was starting to get the sense that him asking for—and getting—the discount on repairs might not actually have been the end of the negotiation after all.

"Mars," Holden said.

"Yes, Mars is dying," Fred agreed with a nod. "No stopping that. But we also have a bunch of OPA extremists making noise. The Callisto attack last year was their work. The water riot on Pallas Station. And there have been other things. Piracy's up, and more of those ships have a split circle painted

on them than I'd like."

"I'd think any problems they had would be solved by everyone getting their own free planet."

Fred took another pull of his drink before he answered. "Their position is that the Belter culture is one adapted to space. The prospect of new colonies with air and gravity reduces the economic base that Belters depend on. Forcing everyone to go down a gravity well is the moral equivalent of genocide."

Holden blinked. "Free planets are genocide?"

"They argue that being adapted to low g isn't a disability, it's who they are. They don't want to go live on a planet, so we're killing them off."

"Okay, I can see not wanting to spend six months pumped full of steroids and bone growth stimulators. But how are we killing them?"

"For one thing, not all of them can tolerate that. But that's not really the point. It's that this," Fred said, waving at the space station around them, "is pretty much over once everyone has a planet. For generations, at the minimum. Maybe forever. No reason to dump resources into the outer planets or mining the Belt when we can find the same stuff down a well and get free air and water to boot."

"So once they don't have anything anyone wants, they'll just starve to death out here?"

"That's how they see it," Fred said. He and Holden shared a quiet moment while they drank.

"Yeah," Holden finally said. "Well, they've got a point. But I don't know what they can do about it."

"There are people trying to figure that out. But it's ramping up."

"Callisto and Pallas."

"And more recently they ran an attack on Earth with an old mothballed heavy freighter."

Holden laughed. "I haven't read that Earth got bombed, so that must not have worked."

"Well, it was a suicide attack, and the suicide half worked. The UN fleet in high orbit patrol reduced the freighter to gas a tenth of an AU from the planet. No damage, not much press. But it's possible those were all preliminary. That they're planning some big showy statement about how the Belt can't be ignored. The thing that scares the shit out of me is that no one

can figure out what it will be.”

The gently sloping main corridor of the Tycho Station habitation ring was filled with workers. Holden didn't pay much attention to the station schedules, but he assumed the crowds passing him meant it was shift change. Either that, or an orderly evacuation with no alarms sounding.

“Yo! Holden,” someone said as they passed.

“Hey,” Holden said, not sure who he was saying it to.

Celebrity was not something he'd figured out how to handle, yet. People would point, stare, whisper to each other when he walked by. He knew it generally wasn't intended as insult. Just the surprise people felt when someone they'd only seen on video screens before suddenly appeared in the real world. Most of the murmured conversations, when he could overhear them, consisted of *Is that James Holden? I think that's James Holden.*

“Holden,” a woman walking toward him down the corridor said, “what's up?”

There were fifteen thousand people on Tycho, working in three different shifts. It was like a small city in space. He couldn't remember if the woman speaking to him was someone he should know or not, so he just smiled and said, “Hey, how's it going?”

“Same same,” she said as they passed.

When he reached the door to his apartment it was a relief that the only person inside was Naomi. She sat at the dining table, a steaming mug of tea in front of her, a distant look in her eyes. Holden couldn't tell if she was melancholy or solving a complex engineering problem in her head. Those looks were confusingly similar.

He pulled himself a cup of water out of the kitchen tap, then sat across from her waiting for her to speak first. She looked up through her hair at him and gave him a sad smile. Melancholy, then, not engineering.

“Hey,” she said.

“Hey.”

“So I have a thing.”

“Is it a thing I can fix?” Holden asked. “Point me at the thing.”

Naomi sipped at her tea, buying time. Not a good sign, because it meant this was something she wasn't sure how to talk about. Holden felt his stomach muscles tightening.

"That's kind of the problem, actually," she said. "I need to go do something, and I can't have you involved in it. At all. Because if you are, you'll try to fix it and you can't do that."

"I don't understand," Holden said.

"When I come back, I promise full and complete disclosure."

"Wait. Come back? Where are you going?"

"Ceres, to start," Naomi said. "But it may be more than that. I'm not sure how long I'll be gone."

"Naomi," Holden said, reaching across the table to take her hand. "You're scaring the shit out of me right now. There's no way you can jet off to Ceres without me. Especially if it's something bad, and I'm getting the feeling it's something really bad."

Naomi put down her tea, and gripped his hand in both of hers. The fingers that had been holding the mug were warm, the others cool. "Except that is what's happening. There's no negotiation on this. So, either I go because you understand and will give me the space to handle this on my own, or I go because we've broken up and you no longer get any vote in what I do."

"Wait, what?"

"Have we broken up?" Naomi asked. She squeezed his hand.

"No, of course not."

"Then thank you for trusting me enough to let me handle this on my own."

"Is that what I just said?" Holden asked.

"Yeah, pretty much." Naomi stood up. She had a packed duffel on the floor next to her chair that Holden hadn't seen. "I'll be in touch when I can, but if I can't, don't read anything into it. Okay?"

"Okay," Holden replied. The whole scene had taken on a vaguely dreamlike feel. Naomi, standing at the end of the table holding her olive-green duffel bag, seemed very far away. The room felt bigger than it was, or else Holden had shrunk. He stood up too, and vertigo made him dizzy.

Naomi dropped the duffel on the table and wrapped both arms around him. Her chin was against his forehead when she whispered, "I'll be back. I

promise.”

“Okay,” he said again. His brain had lost the ability to form any other words.

After one last tight squeeze, she picked up her bag and walked to the door.

“Wait!” he said.

She looked back.

“I love you.”

“I love you too,” she said, and then was gone.

Holden sat back down, because it was that or sink to the floor. He finally pulled himself out of the chair a minute or an hour later; it was hard to tell. He had almost called Amos to join him for a drink when he remembered Amos and Alex were gone too.

Everyone was.

It was strange how nothing could change while everything did. He still got up every morning, brushed his teeth, put on a fresh set of clothes, and ate breakfast. He arrived at the repair docks by nine a.m. local time, put on a vacuum suit, and joined the crew working on the *Rocinante*. For eight hours he'd climb through the skeletal ribs of the ship, attaching conduit, installing replacement maneuvering thrusters, patching holes. He didn't know how to do everything that needed to be done, but he wanted to, so he shadowed the technicians doing the really complicated work.

It all felt very normal, very routine, almost like still having his old life.

But then he'd return to his apartment eight hours later and no one would be there. He was truly alone for the first time in years. Amos wouldn't come by asking him to hit a bar. Alex wouldn't watch the video streams sitting on his couch and making sarcastic comments to the screen. Naomi wouldn't be there to ask about his day and compare notes on how the repairs were coming. The rooms even smelled empty.

It wasn't something about himself he'd ever had to face before, but Holden was coming to realize how much he needed family. He'd grown up with eight parents, and a seemingly endless supply of grandparents, aunts,

uncles, and cousins. When he'd left Earth for the Navy, he'd spent four years at the academy with roommates and classmates and girlfriends. Even after his dishonorable discharge, he'd gone straight to work for Pur'N'Kleen on the *Canterbury* and a whole new loose-knit family of coworkers and friends. Or if not family, at least *people*.

The only two people he'd been close with on Tycho were Fred, so busy with his political machinations he barely had time to breathe, and Sam, who'd died in the slow zone years ago. The new Sam—Sakai—was a competent engineer and seemed to take fixing his ship seriously, but had expressed no interest in any association outside of that.

So Holden spent a lot of time in bars.

The Blauwe Blome was too noisy and too filled with people who knew Naomi but not him. The places close to the docks were full of boisterous workers coming off shift and picking a fight with a famous guy seemed like a great way to blow off steam. Anyplace else with more than four people in it at a time turned into *line up to have your picture taken with James Holden then ask him personal questions for an hour*. So, he found a small restaurant nestled in a side corridor between a residential section and a strip of commercial shopping outlets. It specialized in what the Belters were calling Italian food and had a small bar in a back room that everyone seemed to ignore.

Holden could sit at a tiny table skimming the latest news on his hand terminal, reading messages, and finally check out all the books he'd downloaded over the last six years. The bar served the same food as the restaurant out front, and while it was not something anyone from Earth would have mistaken for Italian, it was edible. The cocktails were mediocre and cheap.

It might almost have been tolerable if Naomi hadn't seemingly fallen out of the universe. Alex sent regular updates about where he was and what he was up to. Amos had his terminal automatically send a message letting Holden know his flight had landed on Luna, and then New York. From Naomi, nothing. She still existed, or at least her hand terminal did. The messages he sent arrived somewhere. He never got a failed connection from the network. But the successfully received message was his only reply.

After a couple weeks of his new bad Italian food and cheap cocktails routine, his terminal finally rang with an incoming voice request. He knew

it couldn't be from Naomi. The light lag made a live connection unworkable for any two people not living on the same station. But he still pulled the terminal out of his pocket so fast that he fumbled it across the room.

The bartender—Chip—said, “Had a few too many of my margaritas?”

“The first one was too many,” Holden replied, then climbed under the booth looking for the terminal. “And calling that a margarita should be illegal.”

“It's as margarita as it gets with rice wine and lime flavor concentrate,” Chip said, sounding vaguely hurt.

“Hello?” Holden yelled at the terminal, mashing the touch screen to open the connection. “Hello?”

“Hi, Jim?” a female voice said. It didn't sound anything like Naomi.

“Who is this?” he asked, then cracked his head on the edge of the table climbing back out and added, “Dammit!”

“Monica,” the voice on the other end said. “Monica Stuart? Did I catch you at a bad time?”

“Sort of busy right now, Monica,” Holden said. Chip rolled his eyes. Holden flipped him off, and the bartender started mixing him another drink. Probably as punishment for the insult.

“I understand,” Monica said. “But I have something I'd love to run past you. Is there any chance we can get together? Dinner, a drink, anything?”

“I'm afraid I'm on Tycho Station for the foreseeable future, Monica. The *Roci* is getting a full refit right now. So—”

“Oh, I know. I'm on Tycho too. That's why I called.”

“Right,” Holden said. “Of course you are.”

“Is tonight good?”

Chip put the drink on a tray, and a waiter from the restaurant out front popped in to carry it away. Chip saw him looking at it and mouthed *Want another?* at him. The prospect of another night of what the restaurant laughably called lasagna and enough of Chip's “margaritas” to kill the aftertaste felt like slow death.

The truth was, he was bored and lonely. Monica Stuart was a journalist and had serious problems about only showing up when she wanted something. She always had an ulterior motive. But finding out what she wanted and then saying no would kill an evening in a way that wasn't

exactly like every other evening since Naomi left. “Yeah, okay Monica, dinner sounds great. Not Italian.”

They ate salmon sushi from fish grown in tanks on the station. It was outrageously expensive, but being paid for by Monica’s expense account. Holden indulged himself until his clothes stopped fitting.

Monica ate sparingly, with small precise movements of her chopsticks, almost picking up the rice one kernel at a time. She ignored the wasabi altogether. She’d aged some too, since Holden had last seen her in person. Unlike Fred, the extra years looked good on her, adding a sense of experience and gravitas to her video-star looks.

They’d started the evening talking about little things: how the ship repairs were going, what had happened to the team she’d taken on the *Rocinante* back when the Ring was a new thing, where Alex and Amos and Naomi had gone. He’d found himself talking more than he meant to. He didn’t dislike Monica, but she wasn’t someone he particularly trusted either. But she knew him, and they’d traveled together, and even more than good food, he was hungry to talk to someone he actually sort of knew.

“So there’s this weird thing,” she said, then dabbed at the corners of her mouth with a napkin.

“Weirder than eating raw fish on a space station with one of the solar system’s most famous reporters?”

“You’re flattering me.”

“It’s habit. I don’t mean anything by it.”

Monica rooted around in the satchel she’d brought and pulled out a flimsy roll-out video screen. She pushed plates out of the way and flattened the screen out on the table. When it came on, it showed the image of a heavy freighter, blocky and thick, heading toward one of the rings inside the slow zone. “Watch this.”

The picture sprang into motion, the freighter burning toward a ring gate at low thrust. He assumed it was the one that led from the solar system to the slow zone and Medina Station, but it could have been any of the others. They all looked pretty much the same. When the ship passed through the

gate, the image flickered and danced as the recording equipment was bombarded with high-energy particles and magnetic flux. The image stabilized, and the ship was no longer visible. That didn't mean much. Light passing through the gates had always behaved oddly, bending the images like refraction in water. The video ended.

"I've seen that one before," Holden said. "Good special effects but the plot's thin."

"Actually you kind of haven't. Guess what happened to that ship?" Monica said, face flushed with excitement.

"What?"

"No, really, guess. Speculate. Give me a hypothesis. Because it never came out the other side."

Chapter Six: Alex

Hey, Bobbie,” Alex said to his hand terminal’s camera. “I’m gonna be downstairs in Mariner for a week or two, stayin’ with a cousin. I was wondering if you wanted to get lunch while I’m in town.”

He ended the message and sent it, put his hand terminal back in his pocket, fidgeted, took it out again. He started paging back through his contacts, looking for another distraction. With every minute, he came closer to the thin exosphere of home. They were already inside the orbit of Phobos and the now invisibly thin scatter of gravel that people called the Deimos Ring. The drop ship didn’t have screens, but from here he’d have been able to see the massive steel of Hecate Base spilling up the side of Olympus Mons. He’d been a boot there after he joined the Navy.

Mariner Valley had been one of the first large-scale settlements on Mars. Five linked neighborhoods that burrowed into the sides of the vast canyons, huddling under the stone and regolith. The network of bridges and tubes that linked them were called Haizhe because the westernmost bridge structures and the trailing tubes made a figure like a cartoon jellyfish. The later high-speed line to Londres Nova was a spear in the jellyfish’s crown.

Three waves of Chinese and Indian colonists dug deep into the dry soil there, eking out a thin, perilous existence, pushing the limits of human habitation and ability. His family had been one of them. He’d been an only child to older parents. He had no nieces or nephews, but the variety of Kamal cousins in the Valley were enough that he could go from one guest room to another for months without wearing out his welcome at any one of them.

The drop ship shuddered, the atmosphere outside thick enough now to cause turbulence. The acceleration alarm chimed pleasantly and a recorded

voice instructed him and the other passengers to check the straps on their gel couches and put any objects more than two kilos into the lockers set into the wall at their sides. The braking burn would commence in thirty seconds, and reach a maximum burn of three gs. The automated concern made that sound like a lot, but he supposed some folks would be impressed.

He put his hand terminal in the locker, cycled it closed, and waited for the braking rockets to push him back into his couch. In one of the other compartments, a baby was crying. The countdown tones began, a music of converging intervals distinguishable in any language. When the tones resolved into a gentle and reassuring chord, the burn kicked in, pressing him into the gel. He dozed as the ship rattled and shook. The atmosphere of Mars wasn't thick enough to use it for aerobraking on their steep descent path, but it could still generate a lot of heat. Half-awake, he ran through the math of landing, the numbers growing more and more surreal as the light sleep washed over him. If something had gone wrong—a change in the burn, an impact shudder passing through the ship, a shift in the couch's gimbals—he'd have been awake and alert in an instant. But nothing happened, so nothing happened. As homecomings went, it wasn't bad.

The port proper was at the base of the valley. Six and a half kilometers of stone rose up from the pads, the strip of sky above them hardly more than thirty degrees from rim to rim. The processing station was one of the oldest buildings in Mariner, its massive clear dome built with the dual purposes of blocking radiation and providing a view that would impress with its scale. The canyons ran to the east, rugged and craggy and beautiful. Lights glittered from the canyon's sides where the neighborhoods impinged out from the rock, the homes of the insanely wealthy trading the safety of deep stone for the status of an actual exterior window. A transport flier passed, hugging low to the ground where the relatively thick air gave its gossamer wings a little more purchase.

Once upon a time, the data said, Mars had been the home of its own biosphere. Rain had fallen here. Rivers had flowed. Not, perhaps, in the geologic eyeblink of human history, but once. And would, the terraformers promised, again. Not in their lifetimes or their children's, but one day. Alex waited in the customs queue, looking up. The pull of the planet, only about one-third g, felt strange. No matter what the math said, thrust gravity felt different than being down a well. Between the magnificence of the canyons

and the eeriness of his weight, Alex felt the anxiety growing in his chest.

He was here. He was home.

The man processing the arriving travelers wore a thick mustache, white with a tinge of red. His eyes were bloodshot and his expression glum.

“Business or pleasure?”

“Neither one,” Alex drawled, “I’m here to see the ex-wife.”

The man gave a quick smile. “That going to be a business meeting, or pleasure?”

“Let’s call it not-business,” Alex said.

The processor stroked the screen of his terminal, nodded toward the camera. As the system confirmed that he was who he claimed to be, Alex wondered why he’d said that. He hadn’t said that Tali was a shrew, he hadn’t insulted her, but he’d leaned on the assumption for a quick joke. He felt like she deserved better from him. Probably she did.

“Joy your stay,” the processing man said, and Alex was free to enter the world he’d left.

His cousin Min stood in the waiting area. She was ten years younger than him, the last vestiges of youth falling from her and the first comfortable heft of middle age creeping in. Her smile belonged to a little girl he’d known once.

“Hey there, podner,” she said, the Mariner drawl probably half a degree thicker than it normally was. “What brings you round these parts?”

“More sentiment than sense,” Alex said, opening his arms. They embraced for a moment.

“You got any luggage?” Min asked.

“Traveling light.”

“Fair enough. I’ve got a cart down at the front.”

Alex hoisted an eyebrow. “You didn’t need to do that.”

“They’re cheaper than they used to be. The kids aren’t back from lower U for another four hours. You got anything you want to do before we’ve got them underfoot?”

“The only two things I’ve been looking forward to were seeing people and a bowl of Hassan’s noodles.”

The look of embarrassment passed over Min’s face and vanished again in an eyeblink. “There’s a great noodle shop over on the south face. Garlic sauce that’ll knock you sideways. But Hassan packed it in about four years

ago.”

“Ah. No, it’s all right. The thing about Hassan’s wasn’t that they were good.”

“Well, now that’s truth.”

“It’s just that they were his.”

The cart was a common electric, wider and tougher than the ones they used on stations. The tires were clear polymer that wouldn’t streak the floors of the corridors. Alex slid into the passenger’s seat, Min taking the controls. They talked about small, domestic things—who in the family was getting married, who was getting divorced, who was moving and where. A surprising number of Min’s siblings were on ships headed for the Ring, and though she didn’t say it outright, he had the sense that she was more interested in hearing about what he’d seen on the other side of it than in him.

They passed down a long access tunnel and then across one of the linking bridges to Bunker Hill. It was the neighborhood where Alex had grown up. His father’s ashes were in the crypt at the synagogue, his mother’s had been scattered over the Ophir Chasmata. The first girl he’d ever kissed had lived in rooms two corridors down from the place Min’s family was in now. His best friend growing up had been an ethnic Chinese boy named Johnny Zhou who’d lived with an older brother and sister on the other side of the canyon.

Driving along the corridors now, the memories flooded him. The curve of the corridor where the Lone Star Sharabaghar had held weekend dance and drinking contests. The time when he was nine that he’d been caught stealing gum from the bodega at the corner of Dallas corridor and Nu Ren Jie. Getting violently sick in the bathrooms at the Alamo Mall Toll Plaza. A thousand things like them probably happened every day. The only thing that made Alex’s experiences different at all was that they were his.

He didn’t recognize for a while what was making him uncomfortable. Like the difference between thrust and planetary gravity, the emptiness of the corridors was almost too subtle to notice at first. Even as Min drove deeper into the neighborhood, it was the lights he noticed, and then the locks. All along the corridors, scattered like a handful of thrown sand, rooms and businesses were closed, the windows dark. That in itself didn’t mean much, but Alex noticed first one, then a few, then—like flowers in a

meadow—a sudden spread of the clunky external locks that landlords and security put on doors when the units weren’t in use. He kept up his end of the banter with his cousin, but he started counting as they drove. In the next hundred doors—homes, businesses, maintenance closets, schools—twenty-one weren’t in use.

As Min pulled the cart to a halt at her own doorway, he mentioned it. “Yup,” she said with a lightness that seemed forced. “Ghost world.”

Somewhere in the years he’d been gone, Talissa had moved. The old rooms they’d had together were in Ballard, tucked in between the naval station and the old water processing plant. According to the local directories, she was in Galveston Shallow now. It wasn’t the neighborhood he’d imagined for her, but things changed. Maybe she’d come into money. He hoped so. Anything that had made her life better, he was in favor of.

The corridors of Galveston Shallow were wide. Half the light came down shafts from the surface, the actual light of the sun strung through a series of transparent shielding to keep the radiation to a minimum. The wide, sloping ceilings gave the place a sense of being natural, almost organic, and the smell of the mechanical air recyclers was nearly hidden by the rich, loamy scents of growing plants. Wide swaths of greenery filled the common areas with devil’s ivy and snake plant. The sorts of things that cranked out a lot of oxygen. The moisture in the air was strange and soothing. This, Alex realized, was the dream of Mars made real, if small. The terraforming project would make the whole planet like this someday, if it worked. Flora and fauna and air and water. Someday, centuries after he was gone, people might walk on the surface of Mars, surrounded by plants like these. Might feel the real sun against their skins.

He was distracting himself. He checked his position on his hand terminal against Tali’s new address. His heart was going faster than usual and he wasn’t sure what to do with his hands. He wondered what she’d say, how she’d look at him. Anger or joy would both be justified. Still, he hoped for joy.

His plan—find the place, gather himself, and ring the bell—failed

because as soon as he turned the last curve to her rooms, he saw her. She was kneeling in among the plants in the common space, a trowel in one hand. She wore thick canvas work pants smeared with soil and a pale brown shirt with a wealth of pockets and loops for gardener's tools, most of them empty. Her hair was a rich brown, so free of gray it had to be dyed. Her face was wider, thicker at the cheeks. Time had been kind to her. She wasn't beautiful. Maybe she'd never been beautiful, but she was handsome and she was Talissa.

Alex felt a smile twitch at his lips, born more from anxiety than pleasure. He pushed his hands into his pockets and ambled over, trying to seem casual. Tali looked up from her work, then down. Her shoulders tensed and she looked up again, staring in his direction. He lifted a hand, palm out.

"Alex?" she said as he reached the edge of the garden space.

"Hey, Tali," he said.

When she spoke, the only thing in her voice was a flat disbelief. "What are you doing here?"

"I had some downtime while my ship's getting fixed up. Thought I'd come back to the old stompin' ground. Touch base with folks. You know."

Talissa nodded, her mouth taking the uneven curl that meant she was thinking hard. Maybe he should have reached out with a message before he came. Only it had seemed to him this was a meeting that should be face-to-face.

"Well," she said. "All right."

"I don't want to interrupt. But, maybe when you're done, I could buy you a cup of tea?"

Tali rolled back onto her heels and tilted her head. "Alex, stop it. What are you doing here?"

"Nothing," he said.

"No. Something. You're here for something."

"Really, I'm not. I just—"

"Don't," she said, conversationally. "Don't bullshit me. No one just shows up at their ex-wife's house out of the blue because they thought a cup of tea sounded nice."

"Well, all right," Alex said. "But I thought..."

Tali shook her head and turned back to digging through the black soil.

“Thought what? That we’d get a drink together, talk about old times, get a little maudlin? Maybe fall into bed for nostalgia’s sake?”

“What? No. I’m not—”

“Please don’t make me be the bad guy here. I have a rich, full, complex life that you *chose* not to be a part of. I have a lot on my plate just now that I don’t actually want to share with you, and comforting the guy who walked out on me umpteen years ago because he’s... I don’t know, having his midlife crisis? It’s not my priority, and it’s not something that’s fair to expect of me.”

“Oh,” Alex said. His belly felt like he’d swallowed a tungsten slug. His face felt flushed. She sighed, looking up at him. Her expression wasn’t cruel. Wasn’t even unkind. Tired, maybe.

“I’m sorry,” she said. “We’re a couple people who used to know each other. At this point, we’re maybe even a little less than that.”

“I understand. I’m sorry.”

“I didn’t put you in this position. You put me in it. I was just working with my plants.”

“I know. I didn’t mean to discomfort you. Not now, and not before.”

“Not before? Before, when you walked out on me?”

“It wasn’t what I meant to have happen, and it wasn’t about you or—”

She shook her head sharply, grimacing as she did.

“No. Not going to do this. Alex? We’re talking about the past. That’s the conversation I *just said* I don’t want to have. All right?”

“All right.”

“Okay.”

“Sorry if things are... rough.”

“I’ll be fine,” she said.

He lifted his hand again, the same gesture he’d made walking up to her, but with a different meaning now. He turned. He walked away. The humiliation was like a weight on his chest. The urge to turn back, to have one last look in case maybe she was looking at him was almost too much to resist.

He resisted it.

She was right. It was why he’d appeared on her doorstep without warning. Because he’d known that if she said no, he had to respect that, and somewhere in the back of his mind, he’d thought that if they were there,

breathing the same air, it would be harder for her to turn him away. And maybe it had been. Maybe what he'd done was actually make it worse for her.

The first bar he came to was named Los Compadres, and the air inside it smelled of hops and overheated cheese. The man behind the bar looked barely old enough to drink, his sallow skin set off by ruddy hair and a mustache that could generously be called aspirational. Alex took a high stool and ordered a whiskey.

"Little early in the day for celebration," the barkeep said as he poured. "What's the occasion?"

"It turns out," Alex said, exaggerating his Mariner Valley drawl just a little for the effect, "that sometimes I'm an asshole."

"Hard truth."

"It is."

"You expect drinking alone to improve that?"

"Nope. Just observing the traditions of alienated masculine pain."

"Fair enough," the barkeep said. "Want some food with it?"

"I'd look at a menu."

Half an hour later, he was only halfway through the drink. The bar was starting to fill up, which meant maybe twenty people in a space that would have taken seventy. Ranchero music played from hidden speakers. The thought of going back to his cousin's and pretending to be cheerful was only a half a degree worse than continuing to sit in the bar, waiting for his self-pity to fade. He kept trying to think about what he could have said or done differently that would have made any difference. So far the best he'd come up with was *Don't walk out on your wife*, which was about the same as saying *Be someone else*.

His hand terminal buzzed. He pulled it up. A written message tagged from Bobbie Draper.

HEY, ALEX. SORRY IT TOOK SO LONG TO GET BACK TO YOU. THINGS ARE WEIRDLY BUSY. YES, IF YOU'RE IN TOWN, I'D LIKE TO MEET WITH YOU. MAY HAVE A FAVOR TO ASK, IF YOU'RE UP FOR IT. SWING BY ANYTIME.

Her address was in Londres Nova. Alex tapped it, and the screen shifted to a map. He wasn't far from the express tube. He could be out there by supper. He touched the bar top with his hand terminal, paid for the drink,

and stretched. In the corridor, a cart had broken down, and half a dozen maintenance workers were clumped around it. A woman with skin the color of milk walking past did a subtle double take when Alex nodded. Wondering, he guessed, whether he was the pilot for James Holden. He walked on before she could ask the question.

Yeah. It would be good to see Bobbie.

Chapter Seven: Amos

The spaceport had been built a kilometer outside Lovell City a century before. Now, it was the geographical heart of Luna's largest metropolis, though you wouldn't have been able to tell that from space. Luna boasted very few actual domes. The constant rain of micro-meteors turned a dome into a randomly firing atmosphere ejection port. So as the shuttle descended, the only visible signs of the city were the occasional surface access points and the spaceport itself. The docks weren't the originals, but they were still damned old. The decking had all been white once. Gray pathways marked where years of boots and carts had worn down tracks. The union office looked down over the long hall through pockmarked windows, and the air had the gunpowder stink of lunar dust.

The extortion boys showed up at the disembarking area in force to stare Amos down as he left the ship. He smiled and waved and kept Rico, Jianguo, and Wendy close to him until they were out of the long flight terminal.

"Hermano," Rico said, shaking hands with Amos. "Where you headed to now?"

"Down the well," Amos said. "You fellas take care of that little girl, right? And good luck with the new jobs."

Jianguo hugged Wendy close. "We will. Xie xie usted ha hecho."

Rico and Jianguo stared at him like they expected something else, but Amos had nothing left to say so he turned and walked away toward the terminal for planetary drops. The waiting area was housed in a large false dome designed to impress the tourists. The whole thing was underground, but the massive chamber was covered floor to ceiling with ultra-high-definition video screens showing the outside view. The hills and craters of

the lunar surface stretched off in all directions, but it was the blue-and-green half-circle hanging in the sky that drew the most attention. It was beautiful at this distance. The cities nothing but firefly twinkles on the dark side. Where the sun struck the Earth, almost nothing man had made was visible from the lunar orbit. The planet looked clean, unspoiled.

It was a pretty lie.

Seemed like a fact of the universe that the closer you got to anything, the worse it looked. Take the most beautiful person in the solar system, zoom in on them at the right magnification and they were an apocalyptic cratered landscape crawling with horrors. That's what the Earth was. A shining jewel from space, up close a blasted landscape covered with mites living by devouring the dying.

"One ticket to New York," he said to the automated kiosk.

The drop to Earth was short enough that no one tried to run an extortion racket on him, so that was nice. The flight itself was bumpy and nauseating, so that was less nice. One thing about space: it might be a big radiation-filled vacuum that'd kill you in a heartbeat if you weren't paying attention, but at least it never had turbulence. There weren't any windows on the shuttle, but the front of the cabin had a big viewscreen showing the descent through the forward external cameras. New York grew from a gray smudge to a visible cityscape. The spaceport on the artificial land mass south of Staten Island went from a silver postage stamp to a vast network of landing pads and launching rails surrounded by the Atlantic Ocean just past the entrance to Lower New York Bay. Tiny toy ships of suitable size for bobbing in a child's bath grew into the vast solar-powered cargo ships that crawled back and forth across the oceans. Everything visible on the descent was clean and technologically sleek.

That was a lie too.

By the time the shuttle landed he was ready to get into the grunge of the city if only to see something that was honest about itself. When he stood up in the full gravity of Earth to walk off the shuttle, he wanted it to feel wrong, oppressive after all his years away. But the truth was that something

deep in him, maybe down at the genetic level, rejoiced. His ancestors had spent a few billion years building all their internal structures around the constant of one g downward pull, and his organism breathed a sigh of relief at the amazing *rightness* of it.

“Thank you for flying with us,” a pleasantly nondescript face said from the video screen next to the exit. The voice was carefully crafted to have no specific regional dialect or obvious gender markers. “We hope to see you again soon.”

“Go fuck yourself,” Amos said to the screen with a smile.

“Thank you, sir,” the face replied, actually seeming to look him in the eye. “TransWorld Interplanetary takes your comments and suggestions seriously.”

A short tube ride from the landing pad to the spaceport visitors center later and he was in the customs line to enter New York City and officially walk on Earth soil for the first time in twenty-some years. The visitor center stank of too many bodies pressed too tightly together. But under it there was a faint, not-unpleasant odor of rotting seaweed and salt. The ocean, just outside, seeped into everything. An olfactory reminder to everyone passing through the Ellis Island of the space age that Earth was absolutely unique to the human race. The birthplace of everything. The salt water flowing in everyone’s veins first pulled from the same oceans right outside the building. The seas had been around longer than humans, had helped create them, and then when they were all dead, it’d take their water back without a thought.

That, at least, wasn’t a lie.

“Citizenship, guild, or union docs,” the bored-looking man at the customs kiosk said. It appeared to be the only job left in the building not done by a robot. Computers, it seemed, could be programmed to do almost anything but sense when someone was up to no good. Amos had no doubt a full body scanner was looking him over, measuring his heart rate, his skin moisture levels, his respiration. But all of those things could be faked with drugs or training. The human behind the counter would be looking to see if he just *seemed* wrong.

Amos smiled at him. “Sure,” he said, then pulled up his UN citizenship records on his hand terminal and the customs officer’s computer grabbed them and compared them to the database. The officer read his screen, his

face betraying nothing. Amos hadn't been home in almost three decades. He waited to be directed off to the additional security line for a more thorough search. It wouldn't be the first unfamiliar finger up his ass.

"Okay," the customs officer said. "Have a good one."

"You do the same," Amos replied, not able to fully keep the surprise off his face. The customs guy waved an impatient hand at him, telling him to move along. The person waiting behind him in line cleared their throat loudly.

Amos shrugged and moved across the yellow line that legally separated Earth from the rest of the universe.

"Amos Burton?" someone said. An older woman in an inexpensive gray suit. It was the sort of thing mid-level bureaucrats and cops wore, so he wasn't surprised when the next thing she said was, "You need to come with us now."

Amos smiled at her and considered his options. Half a dozen other cops were converging on him in the tactical body armor high-risk entry teams wore. Three of them had tasers out, the other three semiautomatic handguns. Well, at least they were taking him seriously. That was sort of flattering.

Amos raised his hands over his head. "You got me, Sheriff. What are the charges?"

The plainclothes officer didn't respond, and two members of the tactical team pulled his hands behind his back and cuffed him.

"I'm wondering," Amos said, "because I just got here. Any crimes I'm going to commit are theoretical at this point."

"Shush now," the woman said. "You're not under arrest. We're going to take a ride."

"And if I don't want to?"

"Then you'll be under arrest."

The port authority police station was pretty much exactly like every other police station Amos had ever spent time in. Sometimes the walls were industrial taupe; sometimes they were government green. But the concrete

walls and glass-fronted offices looking out over a crowded bull pen of desks would have been just as comfortable on Ceres as it was on Earth. Even the burnt-coffee smell was the same.

The plainclothes cop took him past the desk sergeant with a nod and deposited him in a small room that didn't look like the interrogation rooms he was used to. Other than a table and four chairs, the only other furnishing was a massive video screen covering most of one wall. Plainclothes sat him in a chair across from it, then left the room, closing the door behind her.

"Huh," Amos said, wondering if this was some new interrogation technique in the cop playbook. He leaned back in the chair to get comfortable, maybe try to catch some shut-eye after the nauseating shuttle ride.

"What is this? Nap time? Someone wake him the fuck up," a familiar voice said.

Chrisjen Avasarala was on the screen, looking down on him, her face four times its real size on the giant monitor.

"Either I'm not in any trouble, or I'm in all of it," Amos said with a grin. "How you doin', Chrissie?"

"Good to see you too. Call me that again and I'll have an officer beat you gently with a cattle prod," Avasarala replied, though Amos thought he caught a hint of a smile on her face.

"Sure thing, Madam Uber Secretary. This a social call, or...?"

"Why," Avasarala said, all traces of humor gone, "are you on Earth?"

"Came to pay respects to a friend who died. Did I forget to file a form or something?"

"Who? Who died?"

"None of your fucking business," Amos said with a false amiability.

"Holden didn't send you?"

"Nope," Amos replied, feeling the anger start to warm his belly like a slug of good scotch. He tested the restraints, calculating his odds of getting out of them. Of fighting his way past a room full of cops. It made him smile without realizing it.

"If you're here for Murtry, he isn't on Earth right now," Avasarala said. "He claims you beat him half to death in the *Rocinante's* airlock during the flight back. Do you mean to finish the job?"

"Murtry swung first, so technically, that was self-defense. And if I'd

wanted him dead, don't you think he'd be dead? It's not like I quit hitting him because I was tired."

"So what, then? If you have a message for me from Holden just spit it out. If Holden is sending messages to someone else, tell me who and what they are right now."

"Holden didn't send me to do shit," Amos said. "Am I repeating myself? I feel like I'm repeating myself."

"He—" Avasarala started, but Amos cut her off.

"He's the captain of the ship I sail on, he ain't the boss of my fucking life. I've got personal shit to do, and I came here to do it. Now either book me for something or let me go."

Amos hadn't realized Avasarala was leaning forward in her chair until she relaxed back into it. She let out a long breath that turned into a sigh. "You're fucking serious, aren't you?"

"Not known for my comic stylings."

"All right. But you understand my concern."

"That Holden is up to something? Have you met that guy? He's never done anything secretly in his life."

Avasarala laughed at that. "True. But if he's sending his hired killer to Earth, we—"

"Wait, what?"

"If Holden was—"

"Forget Holden. You called me his hired killer. Is that how you guys think of me? The killer on Holden's payroll?"

Avasarala frowned. "You're not?"

"Well, mostly I'm a mechanic. But the idea that the UN has a file on me somewhere that lists me as the *Rocinante's* killer? That's kind of awesome."

"You say that kind of thing, it doesn't make me think we're wrong, you know."

"So," Amos said, shrugging with his shoulders like an Earther, his hands still behind his back, "we done here?"

"Mostly," Avasarala said. "How was everyone when you left? Good?"

"*Roci* got beat to shit during the Ilus thing. But crew's good. Alex is trying to reconnect with an ex. Captain and Naomi are still rubbing uglies pretty regular. Same same, mostly."

"Alex is on Mars?"

“Well, his ex is. I assume he’d head over there, but he was still on Tycho last I saw him.”

“That’s interesting,” Avasarala said. “Not the part where he’s reconnecting with his ex-wife, though. No one ever tries that without seeming like an asshole.”

“Right?”

“Well,” Avasarala said, then looked up at someone offscreen. She smiled and accepted a steaming cup from a disembodied hand, then took a long sip and sighed with pleasure. “Thank you for meeting with me, Mr. Burton.”

“Oh, it was my pleasure.”

“Please keep in mind that my name is pretty closely connected with the *Rocinante*, Captain Holden, and his crew at this point.”

“So?” Amos said with another shrug.

“So,” Avasarala said, then put her steaming cup down and leaned forward again. “If you’re about to do something I’ll need to cover up later, I’d appreciate a call first.”

“You got it, Chrissie.”

“Honestly. Fucking stop that,” she said with a smile.

The screen went black, and the woman who’d stopped him at the port came in. Amos pointed to the screen with his chin.

“I think she likes me.”

The street level view of New York wasn’t all that different from the Baltimore streets he’d grown up on. Lots of tall buildings, lots of automated street traffic, lots of people stratified into two distinct groups: those who had someplace to be, and those who didn’t. The employed scuttled from public transit to office buildings and back again at shift change. They bought things from street vendors, the simple fact of having currency a mark of status. Those on basic drifted and bartered, living on the excess created by the productive, and adding to it where they could with under-the-table industry too small for the government to notice.

Drifting among them like ghosts, invisible to anyone not from their world, was a third group. The ones who lived in the cracks. Thieves looking

for an easy score. Pushers and con artists and prostitutes of every age group, every point on the spectrum of gender and sexual orientation. The kind of people Amos had once been. A corner pusher saw him looking and frowned back, seeing Amos for what he was without recognizing him. It didn't matter. He wouldn't be in town long enough for it to get to anyone who'd come demanding to know where he fit in their ecosystem.

After walking for a couple hours, getting used to the feel of the gravity and concrete beneath his feet, Amos stopped at a hotel he picked at random and checked in. One thing about him had changed, and that was money. Shipping with the *Rocinante*, for all its dangers and drama, had turned out to be a profitable gig. With the shares he'd cashed out, Amos didn't have to worry about how much the hotel would cost; he just asked for a room and told his terminal to pay for anything the hotel charged him.

In his room, he took a long shower. Lydia's face stared back at him from the bathroom mirror as he brushed his teeth and shaved off the short stubble growing on his head. Getting clean had the feeling of ritual. Like preparations made by a holy man before performing some sacred rite.

When he was done, he sat down nude in the middle of the room's large bed and looked up Lydia's obituary.

LYDIA MAALOUF ALLEN, PASSED AWAY WEDNESDAY, APRIL 14TH AT...

Allen. Amos didn't know that name. As an alias it wasn't a very good one, since Lydia Maalouf was the name he'd always known her by. Not an alias then. A married name? That was interesting.

SHE IS SURVIVED BY HER HUSBAND OF ELEVEN YEARS, CHARLES JACOB ALLEN...

Over a decade after he'd left, Lydia had married a man named Charles. Amos probed at that idea, like poking a finger into a wound to see if it was infected. To see if it hurt. The only reaction he found was curiosity.

SHE PASSED QUIETLY IN HER PHILADELPHIA HOME, WITH CHARLES AT HER SIDE...

Charles was the last one to see her alive, so he was the first one Amos needed to find. After reading the rest of the obituary several times, he logged on to the public mass transit site and booked a ticket for that night on the high-speed rail to Philadelphia. Then he lay back on the bed and closed his eyes. He was oddly excited by the idea of meeting Lydia's

husband. As if her family was his, and Charles was a person he should always have known, but was only now getting to meet. Sleep eluded him, but the soft bed relaxed the muscles tightening in his back, and the last of the nausea from the shuttle ride faded. The path ahead was clear.

If Lydia had, indeed, died quietly in her own bed with a loving husband at her side, then he would meet this man. See the home she'd lived in. Put flowers on her grave and say his last goodbye. If not, he'd kill some people. Neither possibility excited him more than the other. Either one was fine.

He slept.

Chapter Eight: Holden

Holden ran the video back and watched it again. The ship, an ugly box of metal with additional storage containers strapped to its flanks, made him think of the supply-laden covered wagons in old westerns. It wasn't far from the truth. The *Rabia Balkhi*, registered to Captain Eric Khan out of Pallas, was still just goods and people heading into the frontier to stake a claim. Fewer horses, maybe, but more fusion reactors.

Again, the ship passed through the gate, the image wiggled and jumped, the *Balkhi* was gone.

"So?" Monica asked, her voice rich with anticipation. "What do you think?"

He scratched his arm, deciding what the answer was.

"There are a million reasons an old rust bucket like that might disappear out there," he said. "Loss of core containment, loss of atmospheric pressure, run into debris. Hell, the radio might have just gone out and they're living comfortably on a new planet and hoping someone will drop by to check on them."

"Maybe," Monica said with a nod. "If there was only one. But four hundred thirty-seven ships have passed through the rings into new solar systems over the last year. And of them, thirteen have just vanished. Poof." She spread her fingers out like a tiny explosion. Holden did the math in his head. That was something like a three percent rate of loss. Back when he'd been in the Navy, the budgets had assumed about half of a percent loss to mechanical failure, asteroid impacts, sabotage, and enemy action. This was six times that.

"Huh," he said. "That seems pretty high for ships that were able to fly the year and a half to get to the Ring."

“Agreed. Way too high. If ships blew up without explanation that regularly, no one would ever fly.”

“So,” Holden said, then paused to order another drink from the table menu. He had a feeling he’d need it. “Why isn’t anyone talking about it? Who’s keeping track of them?”

“No one!” Monica said triumphantly. “That’s the whole thing. No one is tracking them. We have thousands of ships leaving the inner system and streaming toward the gates. They belong to citizens of three different governments, and some who don’t think of themselves as citizens of *any* government. Most of these people never even filed a flight plan, they just threw their suitcases in a rock hopper and blasted off for the new worlds.”

“Real estate grabs are like that, I guess.”

“So here they are, heading off alone or in handfuls, and all of them with the incentive to get wherever it is first. Only something’s stopping them. Disappearing them. Or, some of them anyway.”

“Clearly,” Holden said, “you have a theory.”

“I think it’s the protomolecule.”

Holden sighed and rubbed his face with both hands. His drink arrived, and he sipped at it for a minute. The cold of the ice and the bite of the gin filled his mouth. Monica stared at him, practically bouncing with impatience. He said, “No, it’s not. The protomolecule is gone. It’s dead. I fired the last processing node into a star.”

“How do you know that? Even if it was the last of the ring-building weapon, we know whoever made all this did it with protomolecule tools. And what else can it be? I’ve read the reports. All those robots and things that woke up on Ilus? The protomolecule attacks us for taking its stuff.”

“No, it doesn’t,” Holden said. “That’s not what happened. Without knowing it, I’d brought a node of the original infection with me that was still trying to connect with whatever sent it out in the first place. It woke a lot of stuff up in the process. We shut it down, and, you know, shot it into a star to avoid that happening again.”

“How can you be sure?”

At the sushi bar, one of the chefs barked out an announcement, and half a dozen people around him applauded. Holden took a deep breath, letting it out slowly through his teeth.

“I guess I can’t be. How do you prove a negative?”

“I know a way that maybe you can,” Monica said. The look on her face made Holden think whatever she was about to say next was the entire reason for their conversation. It felt a little like watching a hunting cat track a steak. “Fred Johnson still has what may be the only remaining sample of the protomolecule. The one you took off the secret Mao-Kwikowski ship.”

“The one I... Hey, how do you know that?” Holden said. “And how many other people know that?”

“I don’t disclose sources, but I think we should get it and see if we can wake it up. Get your ghost Miller to come back and find out if the protomolecule is using the gates to destroy our ships.”

Half a dozen responses crashed together in Holden’s mind, ranging from *That is the worst idea I’ve ever heard* to *Are you even listening to what you’re saying?* It took a few seconds for one to win out.

“You want me to do a *séance*?”

“I wouldn’t call it a—”

“No,” Holden said. “Just no.”

“I can’t just let this drop. If you won’t help—”

“I didn’t say I wouldn’t help. I said I’m not going to go commune with a bit of killer alien goo in hopes that it starts telling me its old cop stories. We don’t want to poke that stuff. We should leave it alone.”

Monica’s expression was open and interested. He wouldn’t have been able to see her annoyance and disappointment if he hadn’t known to look.

“What then?” she asked.

“You know the old joke about hearing hoofbeats, right?”

“I guess I don’t.”

“Long story, but the point is that if you hear hoofbeats in the distance, your first guess is that they’re horses, not zebras. And you’re hearing hoofbeats and jumping straight to unicorns.”

“So what are you saying?”

“I’m saying let’s go see if we can find some horses or zebras before we start a unicorn hunt.”

An intriguing new mystery didn’t mean Holden no longer had a day job, but

it did give him something to think about other than missing Naomi. And Amos. And Alex. But mostly Naomi. As he crawled along the exposed ribs of the *Rocinante*'s flank with a plasma torch in his hand and looked for cracks, he pondered where ships could go when they disappeared. Monica was right; the number was too high to be just random system failures. There were a lot of other possibilities, even discounting her protomolecule unicorn theory. But Holden had stopped believing in coincidence about when he'd first started spending time with Detective Miller. And the other big thing going on was that radical OPA factions were launching attacks on inner planet holdings like Callisto. And even Earth.

A violent faction of the OPA was dead set against colonization. And, now, colony ships loaded with supplies were vanishing without a trace. Also, Medina Station—nee *Behemoth* nee *Nauvoo* and the hub of all the ring gates—was solidly in the control of the OPA. It made a compelling narrative, even if he didn't have any actual evidence that it was true.

In that scenario, the ships would be boarded by OPA pirate crews, the supplies taken, and the colonists... spaced? A gruesome idea if it were true, and still not the most horrific thing humans had ever done to each other. But that left the ships. They'd keep the ships, and then they'd have to make them disappear. That meant changing the transponder codes. The fact that the *Rocinante* was no longer the *Tachi* was proof that the OPA had that ability.

"Sakai," Holden said, chinning the radio frequency to the private channel he and the chief engineer shared. "Yo, you around?"

"Problem?" he replied in a tone of voice that sounded like he was daring Holden to have a problem. Holden had learned not to be offended by it. Impatience was Sakai's default state.

"More of a riddle."

"I hate riddles," Sakai said.

"Let's say you're trying to figure out if someone has stolen a bunch of ships and changed the transponder codes. How would you find those ships, if you had to?"

The engineer huffed thoughtfully for a moment.

"Don't look for the missing ships," Sakai replied. "Look for the new ones that show up out of nowhere."

"Yes, good. That," Holden said, "is exactly right. Thanks."

He stopped at a cracked weld between the inner hull and one of the ship's ribs and started touching it up with the torch. His faceplate darkened, turning the world into a black place with one bright blue light in it. While he worked, he thought through how you'd track the magically appearing new ships down. The public ship registry was a good place to start, but you'd drown in data trying to do it manually. If Naomi were here, he had no doubt she'd have been able to build a program to find what he wanted in ten minutes on her hand terminal. He, sadly, didn't have her programming skills, but Fred had software engineers on the payroll, and if he—

"Why?" Sakai said. It had been so long since the engineer had spoken that it took Holden a moment to remember the context for the question.

"Why what? Why do I want to know how to find lost ships?"

"Yeah."

"So I have this reporter friend who's looking into some missing ships. I said I'd give her a hand. Just trying to think of ways to actually do that."

"Stuart," Sakai said. It was half statement, half question. "I heard she was on the station."

"Yeah, my old buddy Monica. Truth is, I think she's snipe hunting, but I said I'd help. And I need something to do that isn't feeling lonely and sorry for myself."

"Yeah," Sakai said, then after a long moment added, "So shit hasn't gone weird enough for you to believe in snipes?"

There was a video message light blinking on his home console. Holden tried his hardest not to hope it was from Naomi and still felt a crushing disappointment when Alex's round face appeared on the screen. "Hi boss," the pilot said. "So the thing where I meet up with my ex-wife and we have a tearful reconciliation? Yeah, that was a failure. Probably shoulda thought that one through a little better. But I'm plannin' on stopping by to see Bobbie before I leave, so there's a bright spot. How's my girl? You guys gettin' her all polished up and pretty for my return? I'll check in again when I can. Kamal out."

Holden almost started his reply off by asking for a report on the ex-wife

situation, but the little Naomi voice that now lived in his head said *Don't be nose*, so instead he replied, "Thanks for checking in. Give Bobbie my best. The *Roci*'s still months from ready, so take your time."

He sat for a minute trying to think of something else to say, then just cut the dead air off the end of the message and sent it. It was strange how a person could be so vitally important in your life, and yet you had nothing to say to them when they weren't sharing the same air. Normally, he and Alex would talk about the ship, about the other two crew members, about jobs. With them all split up and the *Roci* in dry dock, there wasn't much left to say that wasn't a personal invasion. Thinking about that looked like the beginning of a long dark road to bitter loneliness, so he decided to go investigating instead.

He kind of wished he had a hat.

"Back so soon?" Fred said when Holden was ushered into his office by one of the OPA leader's minions. "I know my coffee is good, but..."

Holden grabbed a chair and stretched out while Fred puttered with the coffee maker. "So Monica Stuart is on Tycho."

"Yeah. You think someone like that lands on this station without me knowing about it?"

"No," Holden admitted. "But do you know why she's here?"

The coffee maker started hissing to itself, and the office was filled with a rich, bitter smell. While the coffee brewed, Fred leaned over his desk tapping on the terminal. "Something with missing ships, right? That's what our intel team says."

"Have your people looked into it at all?"

"Honestly? No. I'd heard rumblings about it, but we're buried here. Every ship with a functioning Epstein is heading through for the gates. We've got our hands full keeping them from running into each other going through the rings. Most of them are going into unexplored systems with no other ships or stations. We don't hear back from a few, sort of seems like the obvious thing happening."

Holden accepted a steaming mug from Fred with a grateful nod and took

a sip. The old man's coffee didn't disappoint. "I get that," Holden said after another drink. "And I think her theory on it is pretty far-fetched, but it's the kind of thing that will get public traction if we don't find a better answer first."

"She has a theory already?"

"She thinks it's the protomolecule. The robots and tech waking up on Illus is her one datapoint."

"You told me that was a onetime thing," Fred said, frowning over his coffee mug. When he spoke again his words blew steam in front of them, like a whip of dragon breath. "Is Miller back?"

"No, he's not back. As far as I know, there isn't an active protomolecule culture in existence in the universe. But—"

"But I've got the inactive stuff you gave me."

"Right, and Monica knows about it somehow," Holden said.

Fred's frown only deepened at that. "I've got a leak somewhere."

"Yeah, you totally do, but that isn't the part that worries me."

Fred's eyebrows went up in a nonverbal question.

"Monica," Holden continued, "has decided that we should take out the goo and use it like some sort of Ouija board to summon the ghost of Miller."

"But that's stupid," Fred said.

"Right? So I think we should exhaust all other possibilities before we leap right to tinkering with alien viruses."

"First time for everything, I guess," Fred said, only lightly coating the words in sarcasm. "You have alternate theories?"

"I do," Holden said, "but you won't like it."

"I also still have bourbon if we need anesthetic for this operation."

"It may get there," Holden replied, then drank off the rest of his coffee to give himself time. No matter how much Fred had aged over the last half decade, Holden found himself still intimidated by the man. It was hard to broach topics Fred might take offense to.

"More?" Fred asked, pointing at his empty cup. Holden declined with a shake of his head.

"So there's that radical extremist faction of the OPA that you were telling me about," Holden said.

"I don't think—"

“They’ve had at least two public attacks. One on Martian interests, and one on Earth itself.”

“Both of which failed.”

“Maybe,” Holden said. “But we’re assuming we know what their goals were, and that seems like a bad assumption to make. Maybe blowing up a big chunk of a Martian shipyard and forcing the UN home fleet to fire a bunch of missiles at an ancient freighter are wins to them.”

“Okay,” Fred said with a grudging nod. “Fair enough.”

“But there’s a third leg to this. Sure, the radicals think Earth and Mars will abandon them once the new worlds are colonized, but that means the colonists themselves are part of the problem.”

“Agreed.”

“So, what if this radical OPA wing decides that in addition to blowing up some of the inner planets’ shit, they can send a message by taking out some colony ships?”

“Well,” Fred said, speaking slowly as though he were working out the answer as he said it, “the big problem with that is the location of the attacks.”

“Because they happen on the other side of the gates.”

“Exactly,” Fred continued. “If ships were getting nuked as they passed through the Belt, that would be one thing. But on the other side of the gates? Who has access there? Unless you’re thinking the ships were sabotaged in some way. A bomb with a really long fuse?”

“There’s another alternative,” Holden said.

“No, there isn’t,” Fred replied, anticipating his next argument.

“Fred, look, I know you don’t want to think you’ve got people working against your interests on Medina. Doctoring records, maybe. Shutting off sensors when there’re things they don’t want people to see. And I get why that’s hard to swallow.”

“Medina is central to our long-term plans,” Fred said, his words hard as iron. “I’ve placed all of my very best and most loyal people on that station. If the radicals have a fifth column there, then it means that I can’t trust anyone in my organization. I might as well pack it up and retire.”

“There are thousands of people on Medina, I doubt you can vouch for every one of them personally.”

“No, but the people running the station are *my* people. The most loyal I

have. There's no way something like this could be going on without their knowledge and cooperation."

"That's a scary thought."

"It means I don't own Medina Station," Fred said. "It means that the most violent, hard-line, extremist faction of our group controls the choke point of the entire galaxy."

"So," Holden said, "how would one go about finding that out?"

Fred leaned back in his chair with a sigh and gave Holden a sad smile. "You know what I think? I think you're bored, and lonely, and looking for a distraction. Don't dismantle the organization I spent a lifetime building to give yourself something to do."

"But ships are missing. Even if it isn't Medina taking them, something is. I don't know that we can just ignore that and hope it goes away."

"Fix your own ship, Jim. Fix your ship and get your crew back together. This thing with the missing ships isn't your job."

"Thanks for the coffee," Holden said, standing up to leave.

"You're not going to drop it, are you?"

"What do you think?"

"I think," Fred said, "that if you break any of my stuff, you get to pay for it."

"Noted," Holden said with a grin. "I'll keep you in the loop."

As he walked out the door, he could picture Miller smiling and saying, *You can tell you've found a really interesting question when nobody wants you to answer it.*

Chapter Nine: Naomi

Once upon a time there had been a Belter girl named Naomi Nagata, and now there was a woman. Even though the difference between the two had been created a day, an hour, a minute at a time, the Venn diagram of the two almost didn't overlap. What could be cut away, she'd cut years ago. What remained did so in spite of her efforts. For the most part, she could work around them.

"Enjoy your stay on Ceres," the customs agent said, his eyes already flicking to the man standing behind her. She nodded, smiling politely through the spill of her hair, and walked out into the wide corridors of the spaceport. Another face among the millions.

Ceres Station was the biggest city in the Belt. Six million people, more or less, in a hollowed asteroid hundreds of kilometers in diameter. She'd heard that the port traffic alone could add as many as a million transient bodies on a given day. For most of her life, it had been the symbol of inner planetary colonialism. The tower of the enemy on native Belter ground.

Outside the spaceport proper, the corridors were warm bordering on hot, the entropic load of the city trapped by the thermos-bottle vacuum of space. Moisture thickened the air, and the smell of bodies and dried piss was like seeing an old friend's smile. Three-meter-high screens shouted advertisements for machine rigs one second and high fashion the next, their clamor only a thread in the constant, roaring symphony of voices and carts and machinery. A public newsfeed was showing images of fighting somewhere on Earth. Another little insurgent cult or traditional ethnic conflict calling for its due in blood again, important only because it was on Earth. Even for Belters who'd called the float their home for generations, Earth carried a symbolic load. The mother of humanity with her boot firmly

on Belter necks. On the screen, a pale-skinned man with blood sheeting down from a scalp wound held up a book. Probably a holy book. He was shouting, his mouth squared by rage. Kill as many people in the Belt, and it wouldn't have been news. Even now.

She turned spinward, looking for a food kiosk serving something appealing. There were the usual corporate products, the same at any station. Now that the OPA ran Ceres, there were also other options. Dhejet and egg curry, cow-style noodle bowl, red kibble. The foods of her childhood. Belter foods. The kitchen on the *Rocinante* had been designed by someone in the Martian Navy, and the food stocks it accepted were always nourishing, usually good, and sometimes excellent. But they weren't *her* food.

She opted for red kibble from a scarred kiosk with adhesive from generations of nightclub flyers caking its sides. It came in a brown pressed-shred container that fit in her left palm with a plastic spatula like a flattened spoon to eat with. The first bite filled her mouth with cumin and her mind with dust-covered memory. For a moment, she was in her bunk on Tio Kriztec's ship, huddled over the white ceramic bowl she had loved then and forgotten for years, eating quietly while the others sang in the galley. She couldn't have been more than six at the time, but the memory was fresh and bright. She took another bite, savoring it. As she did, she saw the man following her.

He was thin, even for a native. His hair, a dirty gray that flowed back from his head like the folded wings of a bird. He stood maybe fifteen meters away, watching the newsfeed with an air of mild boredom. She couldn't have said what drew her attention to him and left her certain that he was there because of her. Something about the casual way he didn't look toward her, maybe, or the angle of his stance.

Naomi turned spinward again, moving quickly without running, forcing him to keep up. As she walked, she scanned the crowd around her. If she was right, there might be others working in a team. She slid easily through the gaps in the press of bodies, finding the places that opened for a moment as people crossed her path and each other's. She had spent six months on Ceres when she was thirteen and between ships, but the station was still a long way from home territory for her. She did her best, making for a side corridor that she was almost certain ran between the wider pathways.

And maybe she was wrong. Maybe the man, whoever he was, had just

happened to be there when she was feeling particularly anxious. She didn't look back until her side corridor rejoined the larger flow of foot traffic from the next gate over. She took the ground in at a glance, and found the place she needed. A currency-changing booth four meters away with opaque privacy walls made a little space in the flow of people like a stone in a river. Without pausing, she walked to the dead space at its far side and leaned against it, her shoulder blades taking in the cool of the metal. The air was thick enough that she was sweating a little, a dampness at her collarbone and the fringes of her hair. She made herself small and unobtrusive, and counted slowly backward from a hundred.

At thirty-two, Wings hurried past her, his chin high, scanning the crowd before him. The bright metallic taste of fear filled her mouth, and she turned back into the booth, and then past it the other way, down the corridor she'd just left. As she retraced her steps, her mind raced through possibilities. Marco had finally decided to end their standoff, and the threat to Filip had been bait for the trap. Or the security forces had been waiting all this time, and she was about to get caught at last. Or someone who'd watched the newsfeeds from Ilus too much had decided to stalk her. Or Marco was just sending his men to check up on her. The last wasn't least likely.

Back in the main corridor, she flagged down a cart and paid for a trip up three levels to an open park. The woman driving the cart didn't look at her twice, which was a relief. Naomi sat back against the hard formed plastic and finished her kibble. The tires hissed against the decking as they took the ramp up, closer to the center of spin and farther from the port.

"Go du-es someplace precise?" the driver asked.

"Don't know where I'm going," Naomi said. "Know when I'm there."

She'd met Marco when she was sixteen and finishing her distributed classwork equivalency on Hygeia Station. On Luna, her work would have gotten her engineering placements at any of the big shipyards. Since it was just an equivalency, she'd known she had another three, maybe four terms before she could get the jobs, even if she already knew how to do the work.

Marco had been part of a salvage and mining crew that based its repairs

at Hygeia Station, then looped out into the Belt proper, scraping out rare metals and taking care, sometimes, of the wrecks of old ships that crossed their paths. And maybe, the rumor was, some wrecks that were very, very new. His captain had been an old man named Rokku who'd hated the Inner Planets as much as anyone in the Belt. The crew was the deepest flavor of OPA there was, not a military cell because no one had asked them yet. Naomi had been living with Tia Margolis, another of her adopted aunts, and trading out unlicensed work at the refining station for air, water, food, network access, and a place to sleep. At the time, Marco and his cohort had seemed like a bastion of stability. A crew that had been working the same ship together for seven missions was as good as family to her.

And Marco himself had been amazing. Dark eyes, dark soft hair, a Cupid's bow mouth, and a beard that felt against her palm the way she imagined it would to stroke a wild animal. He'd haunted the corridors outside the station bar, too young still to buy, but more than charming enough to get older people to buy for him on the few occasions he couldn't convince the merchants to bend the rules directly. The others on Rokku's crew—Big Dave, Cyn, Mikkam, Karal—had all outranked Marco on the ship and followed his lead on shore. There hadn't been a particular moment when she'd become part of their crew. She'd just fallen into orbit with the others, been at the same places, laughed at the same jokes, and then at some point she was expected. When they cracked the seal on a storage gate and made it into a temporary invitation-only club, she was invited. And then before long she was helping to crack the seal.

Hygeia Station hadn't been at its best in those days. The Earth-Mars alliance had looked solid as stone back then. The taxes and tariffs on basic supplies hovered just below too expensive to sustain life. And sometimes above it. The ships that ran there ran on air so lean they courted anoxia, and the black market in usable hydroponics was a live and active one. Hygeia Station, while nominally the property of an Earth-based business conglomerate, was in practice a ragged autonomous zone held together by habit, desperation, and the bone-deep Belter respect for infrastructure.

When Marco was there, even the old, cracked ceramic decking seemed a little less crappy. He was the kind of person who changed what everything around him meant. There had been a Belter girl named Naomi who would have sworn she'd follow him anywhere. She was a woman now, and she'd

have said that wasn't true.

But here she was.

Bistro Rzhavchina was high up toward the center of spin. Doors of rusted steel painted in sealant blocked the way in, and a bouncer half a head taller than her and twice as wide across the shoulders glowered as she passed through them. He didn't stop her. Up this far, more of the station's spin felt like lateral pull. Water poured on the slant. It wasn't only the cheapness of the real estate that made these corridors thicker with Belters. The Coriolis here started to have an effect just north of subliminal, and that wasn't a thing that Earthers and Martians ever became really comfortable with. Living in spin was a source of Belter pride, a mark of who they were and how they were different.

Dark music filled the place, the rhythm like a constant, low-level assault. The floor was sticky where it wasn't covered with peanut shells, and the smell of salt and cheap beer filled the air. Naomi went to the back, taking a seat sheltered from as many lines of sight as she could manage. Somewhere between fifteen and twenty people sat or stood around the place. She could still feel their gazes on her. Her jaw slid forward a degree, her mouth taking on a scowl that was protective coloration as much as actual displeasure. The wall she rested against vibrated with the bass.

She ordered a drink from the table's system and paid with a preloaded chit. Before the thin-faced boy behind the bar could deliver it, the metal doors to the corridor opened again and Wings came in. His movements were tight and anxious, his expression closed and angry. He hadn't followed her here. This was where he headed back to after he failed. Naomi faded back another centimeter.

Wings sat at the bar, stood up, sat again. A door hidden by shadows at the back of the club opened. The man who came out was huge. The muscles of his neck and torso were so large and defined, she could have used him as an anatomy lesson. His steel-gray hair was cut close to the scalp, white lines of scar crossing behind his left ear like the map of a river delta. A massive tattoo of the OPA's split circle logo decorated the side of his neck. He went to the bar where Wings was waiting. Wings' hands were already out in apology. Naomi couldn't hear what he said, but the gist was clear enough. He'd seen her. He'd lost her. He was sorry. Please don't rip his kneecaps off. She let herself smile a little.

The big man tilted his head, nodded, said something that seemed to relieve Wings enough that he managed a smile. The big man turned slowly, squinting into the gloom of the club. When his gaze reached her, it stopped. The boy at the bar started forward, her drink on a tray. The big man put a hand on the boy's chest, pushing him back. Naomi sat up a little straighter, looking up into the big man's eyes as he reached the table. They were as pale as she remembered.

"Knuckles," he said.

"Cyn," Naomi replied, and then his massive arms were around her lifting her up. She returned the embrace. The smell and heat of his skin was like hugging a bear. "God, you haven't changed at all, have you?"

"Only got better, uhkti. Bigger and brighter."

He put her down with a thump. His smile drew lines all across his face like ripples in a pool. She patted his shoulder and his grin grew wider. At the bar, Wings' eyes were big as saucers. Naomi waved at him. The man sent to follow her hesitated, then waved back.

"So what did I miss?" Naomi asked as Cyn led her to the door at the back of the club.

"Only all of it, sa sa?" Cyn rumbled. "How much did Marco say?"

"Very damned little."

"Always the way. Always the way."

Past the thin door, a corridor snaked back into the raw stone of the asteroid. The sealant was old, gray, and flaking, and cold radiated out from the stone. Three men leaned against the wall, guns in their hands. The oldest was Karal. The younger two she didn't know. She kissed Karal's cheek as she passed. The others looked at her with a mix of distrust and awe. The hidden hallway ended at a steel door.

"Why so secret?" she asked. "You know the OPA runs Ceres now."

"There's OPA and there's OPA," Cyn said.

"And you're that other one," she said, but with warmth in her voice that covered her unease.

"Always," Cyn agreed.

The door slid open, and Cyn ducked to pass through. It was impossible to see around his bulk. Naomi followed.

"Got here and no further," Cyn said over his shoulder. "And best we don't float too long. Plan had us back with Marco a month ago."

“Marco’s not here?”

“Nobody here but us chickens.” There was a smile in the words.

The chamber they stepped into was wide and cold. A portable scrubber moved stale air and left the smell of rubber. Formed plastic shelves held rations and water. A thin laminate table had five stools around it, and an old network repeater hung from a hook by its wires. A set of bunks leaned against the wall four high. There were bodies curled under the blankets, but if they were sleeping, Cyn didn’t take notice of them. His voice carried at the same volume.

“Thing is, better we don’t be where anyone can reach us when it all comes down, sa sa?”

“When what comes down?” Naomi said.

Cyn sat at the table, reached out a long arm, and pulled an unlabeled bottle from the shelves. He pulled the cork from its neck with his teeth.

“Ay, Knuckles,” he said with a laugh, “you said he didn’t tell you much, you weren’t singing low, were you?”

Naomi sat on one of the stools as Cyn poured amber liquid into two glasses. The fumes smelled of alcohol and butter and burned sugar. Naomi felt her mouth responding to the scent. The taste was like coming home.

“Nothing like Tia Margolis’ brandy,” Cyn said with a sigh.

“Nothing, ever,” Naomi said. “So, now that I’m here, why don’t you fill me in?”

“Well,” Cyn said. “It’s these pinché ring gates. You know better than anyone. Another thousand inner planets, and a whole new set of reasons they may as well fuck the Belt, que si? And half the Belt sucking the Butcher’s cock and making themselves out noble and official and political. So we, and by we I mean Marco, yeah? We decide about two, three years ago—”

“We don’t talk about it,” a young man’s voice said sharply. Cyn looked at the door. Thick with dread, Naomi turned too. The boy looked terribly old and terribly young at the same time. His skin was darker than Marco’s, and his hair had more curl. The eyes were the same, though. And the mouth. Something huge—larger than oceans—moved in her chest. Emotions she’d buried rose up, and the rip threatened to pull her away. She tried to hide it, but she had to put a hand flat on the table to steady herself.

He stepped into the room. The sand-colored shirt was large on him, but

she could see that his body was in the place between the coltish growth of adolescence and the thickening muscle of a man. One of the figures on the bunk stirred and turned, but didn't otherwise react.

"We don't talk about it until we're safely back. Not even in here. Not at all. Sabez?"

"Savvy mé," Cyn said. "Just thought since—"

"I know what you thought. It passes, but we don't talk about it."

For the first time, the young man's eyes turned to hers. Her own struggle was mirrored in his eyes. She wondered what she looked like to him. What was in his mind and heart where hers was joy and guilt and a venomous regret. This was the moment she hadn't allowed herself to want. She'd known it was coming since the message from Marco arrived on Tycho. She wasn't ready for it. He made a small, quick smile and nodded to her.

"Filip," she said carefully, as if the word were fragile. When he answered, his voice could have been her echo.

"Mother."

Chapter Ten: Amos

The high-speed rail station in Philadelphia was near the center of a middle-income commercial area. Wage earners wandered the streets between strip malls, buying the semi-fashionable clothes and petty luxuries only available to those with currency. Only not too much currency. High-end shopping would be somewhere else, protected by security designed to keep people like these out.

Even on Earth, there were people with money, and then there were people with *money*.

It was weird for Amos to think that he might have enough in his account to pass for the latter. It amused him to imagine wandering over to some highbrow shopping center in his unstylish Belt-made clothes just to give the sales staff a fit when he dropped a couple grand on something useless. Maybe a nice solid platinum drink shaker. For that once or twice a year when he felt like drinking a martini.

Maybe later. After.

He headed out of the mall and toward the residential district that his hand terminal's map said Lydia's old house was in. At the short, tunnel-like exit he was accosted by a boy of eleven or twelve wearing a cheap paper jumpsuit, the kind that basic kiosks dispensed for free with a thumbprint. The boy offered him a variety of sexual services at rock-bottom prices. Amos grabbed the boy by the chin and tilted his face up. There were the fading yellow marks of a not-too-recent beating on his cheek, and the telltale pink around the eyelids of a pixie dust habit.

"Who's your walker?" Amos said.

The boy yanked back away from his hand. "Don't touch for free, man."

"No troubles. I'm not a grabber. Just who's walking you? He around?"

“Don’t know what you mean.” The boy started looking around for an escape route.

“Yeah, okay. Get lost.” Amos watched the boy run off and felt something pressing at his stomach like the onset of a cramp. He couldn’t help out every street kid he came across. There were too many of them, and he had other work to do. Frustrating, that. Maybe the kid would find his pimp and tell him about the big scary guy who grabbed his face. Then the pimp would come looking for him, to teach him a lesson about not fucking with the merchandise.

The thought put a smile back on Amos’ face and made the knot in his stomach go away.

Lydia’s house was thirty-seven blocks from the train station in a low-income neighborhood, but not in a government housing block. Someone was paying actual money for the place, which was interesting. Amos didn’t think Lydia could have cleaned up her records enough to qualify for job training. Maybe the husband was a citizen with the skills and clean background to get a straight job. That was interesting too. What kind of guy living an honest citizen’s life marries an aging gangster like Lydia?

Amos walked at a leisurely pace, still sort of hoping the pimp would track him down and make an appearance. An hour and a half later his hand terminal told him he’d reached his destination. The house didn’t look like much. Just a small one-level that from the street was an almost exact copy of every other small single-story house in the neighborhood. A tiny garden filled the narrow space between the house and the sidewalk. It looked lovingly tended, though Amos couldn’t remember Lydia ever owning a plant.

He walked up the narrow path through the garden to the front door and rang the bell. A small, elderly man with a fringe of white hair opened a moment later. “Can I help you, son?”

Amos smiled, and something in his expression made the man take a nervous half step back. “Hi, I’m an old friend of Lydia Maalouf. I just found out she’d passed, and I was hoping to pay my respects.” He worked his face for a minute, trying to find a version of his smile that didn’t scare little old men.

The old man—Charles, the obituary had said—shrugged after a minute and gestured for Amos to come into the house. On the inside it was

recognizably Lydia's space. The plush furnishings and brightly colored wall hangings and curtains reminded Amos of the apartment she'd had back in Baltimore. Pictures lined the shelves and tabletops. Snapshots of the life she'd had after Amos left. Two dogs in a field of grass, grinning and lolling their tongues at the camera. Charles, more hair on his head, but still silvery white, digging in the garden. Lydia and Charles together in a restaurant, candles on the table, smiling over their wineglasses.

It looked like a good life, and Amos felt something in his belly relax when he saw them. He wasn't sure what that meant, but it was probably a good thing.

"You got a name?" Charles said. "Want some tea? Was making some when you rang."

"Sure, I'd take some tea," Amos said, ignoring the first question. He stayed in the cozy living room while Charles banged around in the kitchen.

"It's been a couple months since the funeral," Charles said. "Were you up the well?"

"Yeah, working in the Belt most recently. Sorry it took a while to make it back down."

Charles came back out of the kitchen and handed him a steaming mug. From the flavor, it was green tea, unsweetened.

"Timothy, right?" Charles said, as if he were asking about the weather. Amos felt his jaw clench. Adrenaline dumped into his bloodstream.

"Not for a long time now," he replied.

"She talked about your mom, some," Charles said. He seemed relaxed. Like he knew whatever was going to happen was inevitable.

"My mom?"

"Lydia took care of you after your mom died, right?"

"Yeah," Amos said. "She did."

"So," Charles said, then took another sip of his tea. "How does this go?"

"Either I ask if I can take some of those roses out front to lay on her grave..."

"Or?"

"Or I just take them because no one lives here anymore."

"I don't want any trouble."

"I need to know how it happened."

Charles looked down, took a deep breath, and nodded. "She had what

they called an ascending aortic aneurysm. Went to sleep one night, never woke up. I called the EMTs the next day but they said she'd been dead for hours by then."

Amos nodded. "Were you good to her, Charles?"

"I loved her, boy," he replied, a hint of steel in his voice. "You can do what you want here, I can't stop you. But I won't have you questioning that. I loved her from the moment we met to our last kiss goodnight. I still do."

The old man's voice didn't quaver a bit, but his eyes were watery and his hands trembled.

"Can I sit?" Amos asked.

"Suit yourself. Let me know if you want more tea. Pot's full."

"Thank you, sir. I'm sorry about rousting you like that. But when I heard, I worried—"

"I know who Lydia was before we met," Charles said, sitting down on a small couch facing him. "We were always honest with each other. But no one ever bothered us here. She just had a leaky artery and it gave out one night while she was sleeping. Nothing else."

Amos rubbed his scalp for a moment, waiting to see if he believed the old guy. Seemed like he did.

"Thanks. And, again, I'm sorry if I came on strong," Amos said. "So, can I take a few of those roses?"

"Sure," Charles said with a sigh. "Ain't my garden much longer anyway. Take what you want."

"You moving?"

"Well, the guy who was doling Lydia stopped when she died. We had a little set aside, but not much. I'll be going on basic pretty soon, so that means the government block."

"Who was floating her?" Amos asked, already knowing the answer.

"Kid named Erich. Runs a crew in Lydia's old hometown. Somebody you used to know, I guess."

"Used to," Amos agreed. "Does he know about you? That Lydia was married?"

"Sure. He kept in touch. Checked up on us."

"And he cut you off after she died."

It wasn't a question, and Charles didn't answer, just sipped at his tea.

"So," Amos said, standing up, "got a thing I need to go do. Don't start

moving out yet. One way or another, I'll make sure you've got the money to keep this place."

"You don't have to do that."

"Sort of do."

"For her," Charles said.

"For her."

The high-speed to Baltimore took less time than the walk to the station had. The city itself hadn't changed at all in the two decades Amos had been away. The same cluster of commercial high-rises, the same sprawl of basic and minimal-income housing stretching out until it hit the orderly blocks of middle-class houses on the outskirts. The same rotting seaweed smell of the drowned eastern shore, with the decaying shells of old buildings sticking out of the murky water like the ribs of some long-dead sea monster.

As much as the realization bothered him, Amos had to admit it looked like home.

He took an automated electric cab from the train station to his old neighborhood. Even at the street level, the city looked the same, more or less. The streetlights had been swapped out for a different, boxy design. Some of the streets had changed from pedestrian-exclusive to mixed use. The thugs and dealers and sex workers were different faces now, but they were all on pretty much the same corners and stoops their predecessors had worked. New weeds growing in all the city's cracks, but they were the same cracks.

He had the cab let him out at a corner coffee stand that was licensed to accept basic ration cards. It was in the exact same location as the last place he'd ever eaten in Baltimore before he left. The cart and the franchise brand were different, but the assortment of rolls and muffins looked identical.

"Tall cup and a corn muffin," he said to the girl working the cart. She looked so surprised when his terminal transferred actual money instead of basic ration credits that she almost dropped his food. By the time his Ceres New Yuan routed through the network and into UN dollars, with every exchange and transfer tacking on fees, he wound up paying triple for his

snack.

The muffin tasted like it had been recycled from old, previously eaten corn muffins. And the coffee could have passed for a petroleum product, but he leaned against a wall beside the stand and took his time finishing both. He tossed what was left into recycling and thanked the girl. She didn't reply. His space money and foreign clothes left her staring at him like some sort of alien creature. Which, he supposed, he sort of was.

He had no idea where to start looking for Erich. But he didn't have to walk far before a teenage girl with machine-quality braids and expensive cotton pants drifted out of a shadowy doorway.

"Hey," he said. "You got a minute?"

"For you, Mongo?"

"Name's not Mongo," Amos said with a smile. He could see fear in her eyes, but it was well hidden. She was used to dangerous strangers, but part of that was she knew they were dangerous.

"Should be, brute like you."

"You're local. Help a guy out."

"You need herbage? Dust? I got neuros, that's your thing. Make you fly outta this shithole."

"Don't need your stuff to fly, little bird. Just a question."

She laughed and gave him her middle finger. He wasn't a customer, so he wasn't anything. She was already turning back to her dim doorway. Amos grabbed her upper arm, firmly but gently. There was a spark of real fear in her eyes.

"Gonna ask, little bird. You answer. Then I let you fly."

"Fuck you, Mongo." She spat at him and tried to pull her arm out of his grip.

"Stop that. Just gonna hurt yourself. All I want to know is, who runs your crew? Looking to talk to a guy called Erich. Messed-up arm? If your crew ain't with him, just point me at someone who is, sabe?"

"Sabe?" She stopped struggling. "Speak English, asshole."

"Erich. Looking for Erich. Just point me and I'm gone."

"Or maybe I bleed you out," a new voice said. Someone big came out of the same doorway his little bird used. A mountain of a man with scars around his eyes and his right hand inside the pocket of his baggy sweatshirt. "Let her go."

“Sure,” Amos said, and turned little bird loose. She bolted for the steps up to her doorway. The walking mountain gave him a nasty grin. Taking Amos’ compliance for fear.

“Now get gone.”

“Naw,” Amos said, smiling back. “Need to find Erich. Big boss now from what I hear. He running your crew? Or can you point me at a crew working for him?”

“I fucking told you to—” Whatever else the mountain was about to say turned into a gurgle after Amos punched him in the throat. While the mountain was trying to remember how to breathe, Amos yanked up the bruiser’s sweatshirt and plucked out the pistol he had tucked in his belt. He stomped on the back of the mountain’s leg to drop him to his knees. He didn’t point the pistol at him, just held it casually in his right hand.

“So, this is how it goes,” Amos said in a voice low enough the mountain would hear him but no one else would. Embarrassment was the number one reason people fought. Reduce how embarrassed the mountain was, reduce the likelihood he’d continue fighting. “I need to find Erich, and either you’re my friend on that, or you’re not. Do you want to be my friend?”

The mountain nodded, but he wasn’t talking yet.

“See, I like making new friends,” Amos said and patted the thug on his beefy shoulder. “Can you help your new pal find his other friend, Erich?”

The mountain nodded again and managed to rasp out, “Come with me.”

“Thanks!” Amos said, and let him up.

The mountain shot a look at the dim doorway, probably signaling little bird to call ahead to someone—hopefully Erich’s crew—with a warning. That was all right. He wanted Erich to feel safe when they met. If he had a lot of guys with guns with him, he’d be more likely to relax and listen to reason.

The mountain led him through his old neighborhood and down toward the docks and the crumbling stone monolith of the failed arcology project there. He was limping a little, like his knee was bothering him. A couple of guys with baggy coats that only sort of hid the heavy weapons underneath nodded at them as they went in, and then fell in step behind them.

“An escort and everything,” Amos said to one of them.

“Don’t do nothing stupid,” came the reply.

“Fairly sure I’m a few decades late on that one, but I take your point.”

“Gun,” the other guard said, holding out his hand. Amos dropped the pistol he’d liberated from the mountain into it without a word.

From the outside, the old arcology structure was falling apart. But once inside, the look changed dramatically. Someone had replaced the water-damaged flooring with new tile. The walls were painted and clean. The rotting wood doors off the main corridor had been replaced with composites and glass that could take the damp air. It looked like nothing so much as a high-end corporate office building.

Whatever Erich was up to, he was doing well for himself.

They stopped at an elevator, and the mountain said, “He’s up on the top floor. I’m gonna bail, okay?” His voice still rasped, but it sounded a lot better.

“Thanks a lot for the help,” Amos said without sarcasm. “Take care of that throat. Ice it up when you get back and try not to talk too much. If it’s still bugging you in three days, steroid spray’ll do it.”

“Thanks,” the mountain croaked and left.

The elevator dinged and opened, and one of his two remaining guards pointed inside. “After you.”

“Gracias,” Amos said and leaned against the back wall of the car. The guards followed, one of them sliding a metal card into the elevator controls and hitting the top button.

On the way up, Amos entertained himself by figuring out how he’d get the gun away from the guard closest to him and kill the other. He had a pretty workable strategy in mind when the elevator dinged again and the doors slid open.

“This way,” one guard said, and pointed down a hallway.

“The club level,” Amos replied. “Fancy.”

The top floor had been redesigned with plush furnishings and a maroon velvet carpet. At the end of the hall the guards opened a door that looked like wood but seemed heavy enough that it was probably steel core. Still fancy, but not at the cost of security.

After the luxury of the hallway, the office on the other side of the door was almost utilitarian. A metal desk dominated by screens for a variety of network decks and terminals, a wall screen with an ocean view pretending to be a window, and a big rubber ball instead of an office chair.

Erich always had been twitchy sitting still too long.

“Timmy,” Erich said, standing behind the desk like it was a barricade. The two guards moved off to flank the door.

“People call me Amos now.”

Erich laughed. “Guess I knew that, right?”

“Guess you did,” Amos said. Erich looked good. Healthy in a way he’d never looked as a kid. He even had a middle-aged man’s spare tire around the gut. He still had the small, shriveled left arm. And from the way he was standing, he looked like he’d still walk with a limp. But now, surrounded by his success and his well-fed chubbiness, they looked like trophies of a past life instead of disabilities in the current one.

“So,” Erich said, “kind of wondering what you’re doing in town.”

“He beat up Troy,” one of the guards said. “And Laci says he manhandled her some too.”

“Did he kill anyone?” Erich asked. When neither guard answered, he said, “Then he’s still being polite.”

“That’s right,” Amos agreed with an amiable nod. “Not here to mess up your shit, just here to chat.”

“So,” Erich said, sitting back down on his rubber ball chair, “let’s chat.”

Chapter Eleven: Alex

Three days after he'd seen Talissa—for what he had to think now was the last time—and gone afterward to eat with Bobbie Draper, Alex knew it was time to go home. He'd had dinners with family and a couple old friends; he'd seen the ways his old hometown had changed and the ways it hadn't. And he'd determined once again that sometimes a broken thing couldn't be fixed. That was the closest he was going to get to having it be okay.

But before he left, there was one more person he was going to disappoint.

The express tube to Londres Nova hummed to itself, the advertisements above the seats promising to make the lives of the riders better in a hundred different ways: technical certifications, improved undergarments, tooth whitening. The facial-recognition software didn't seem to know what to make of him. None of the ads spoke to him. The closest was a thin lawyer in an olive-green suit offering to help people find passages to the new systems beyond the Ring. *Start a new life in the off-world colonies! We can help!*

Across from him, a boy of about seventeen was staring quietly into space, his eyes half-open at the edge of boredom and sleep. When Alex had been about the boy's age, he'd been deciding whether to go into the Navy or apply for upper university. He'd been dating Kerry Trautwine even though Mr. Trautwine was a religious zealot who hated him for not belonging to the right sect. He'd spent his nights playing battle simulations with Amal Shah and Korol Nadkarni.

This boy across from him was traveling the same corridors that Alex had, eating at some of the same restaurants, thinking about sex in likely more or less the same terms, but he also lived in a different universe. Alex

tried to imagine what it would have been like to include travel to an alien planet in among his options at seventeen. Would he have still enlisted? Would he have met Talissa?

A gentle, mechanical voice announced their arrival at the Aterpol terminal. The boy's eyes opened, roused back to full consciousness, and he shot a distrustful look at Alex. The deceleration pushed Alex's back, feeling almost like a long attitude burn. Almost but not quite.

Aterpol was the downtown of Londres Nova, the only station with connections to all of the neighborhoods that made up the city. The vaulted ceilings curved over the common areas, the access doors along the walls double-sealed to keep air from leaking into the evacuated tubes. The terminal itself opened into a wide public park with real trees rising from the soil into the artificial twilight. Benches made to look like wood and iron stood scattered along the winding paths, and a pond filled the air with the smells of algae and moisture. The reassuring breeze-murmur of the air recyclers passed under everything like a constant and eternal prayer. Windows rose up along the walls, light streaming out of them or not. The rooms that looked out over Alex as he walked were businesses and apartments, restaurants and maintenance halls.

Alex crossed the park to the farther gates, where the local tubes ran to the other neighborhoods. Innis Shallow, where Bobbie lived, didn't have the best reputation. The worst that Mars had to offer wasn't as bad as an iffy sector on Ceres Station, though, and regardless anyone who took on Bobbie was either suicidal or had an army behind them.

At the Innis Shallow station, Alex shrugged into his jacket and went on foot. There were carts for rent and a girl of no more than fourteen with a scavenged rickshaw calling on the corner. It was a short walk, though, and Alex was dreading the conversation at the end of it.

He'd walked the same path three days before, still smarting from his abortive meeting with Tali, following his hand terminal's directions to Bobbie's rooms. He hadn't seen the former marine since Luna the night that the Ring had lifted itself off the ruins of Venus and flown out toward the far

edge of the system, and he'd been looking forward to anything that would distract him from the day he'd been having until then.

Bobbie was living in a very pleasant side corridor with its own greenway in the center and lights that had been fashioned to look like wrought-iron lamps from someone's imagined 1800s London. He'd only had to stand at her door for a few seconds before it opened.

Bobbie Draper was a big woman, and while years of civilian life had lost her a little of her muscle definition, she radiated competence and strength the way a fire did heat. Every time he saw her, he remembered a story from ancient history about the native Samoans armed with rocks and spears driving the gun-toting Spanish conquistadors into the sea. Bobbie was a woman who made that shit seem plausible.

"Alex! Come in. I'm sorry the place is a mess."

"Ain't worse than my cabin at the end of a long run."

The main room was wider than the ops deck back on the *Roci*, and done in shades of terra-cotta and gray that shouldn't have worked together, but did. The dining table didn't seat more than four, and there were only two chairs beside it. Through an archway across from the front door, a wall monitor was set to a slowly shifting spray of colors, like Monet's water lilies animated. Where most places would have had a couch, a resistance-training machine dominated the space, a rack of chrome free weights beside it. A spiral staircase led up and down in the den's corner, bamboo laminate steps glowing warmly in the light.

"Fancy digs," Alex had said.

Bobbie's glance at her own rooms seemed almost apologetic. "It's more than I need. A lot more than I need. But I thought I'd like the space. Room to stretch out."

"You thought you would?"

She shrugged. "It's more than I need."

She put on a brown leather jacket that looked professional and minimized the breadth of her shoulders, then led him to a fish shack with shredded trout in black sauce that had been some of the best he'd ever had. The beer was a local brew, served cold. Over the course of two hours, the sting of Talissa's voice and his feeling of self-loathing lost their edges, if they didn't quite vanish. Bobbie told stories about working veterans' outreach. A woman who'd come in to get psychiatric help for her son who

wouldn't stop playing console games since he'd finished his deployment. Bobbie had made contact with the boy's first drill sergeant, and now the kid had a job at the shipyards. Or the time a man came in claiming that the sex toy lodged in his colon was service related. When Bobbie laughed, Alex laughed with her.

Slowly, he'd started taking his turn too. What it had been like on the far side of the Ring. Watching Ilus or New Terra or whatever the hell they wound up calling it as it went through its paroxysms. What it had been like shipping back with a prisoner, which led into the first time they'd shipped a prisoner—Clarissa Mao, daughter of Jules-Pierre and sister to the protomolecule's patient zero, that one had been—and how Holden and Amos and Naomi were all doing these days.

That had been when the ache hit. The homesickness for his crew and their ship. He enjoyed Bobbie's wit and the easy physicality of her company, but what he'd really wanted—then and in the days since—was to be back on the *Rocinante*. Which was why the end of their conversation had been so awkward for him.

"So, Alex," Bobbie said, her attempt to make the words as casual and friendly as everything that had gone before flagging them at once, "are you still in touch with anyone over at the naval yard?"

"I know a few guys still serving at Hecate, sure."

"So I was wondering if I could get you to do a little favor for me."

"Sure, of course," Alex said. And then a fraction of a second later, "What is it?"

"I've got a kind of hobby thing going on," she said, looking pained. "It's... unofficial."

"Is it for Avasarala?"

"Sort of. The last time she was through, we had dinner, and some of the things she said got me thinking. With the new worlds opening up, there's a lot of change going on. Strategies shifting. Like that. And one of the big resources Mars has—one of the things that there's going to be a market for—is the Navy."

"I don't understand," Alex said, leaning back in his chair. "You mean like mercenary work?"

"I mean like things going missing. Black market. We've been through a couple pretty major wars in the last few years. A lot of ships got scrapped.

Some of them it seems like we just lost track of. And the Navy's stretched pretty thin. I don't know how much energy they're putting into tracking things right now. You know there was an attack on the Callisto shipyards?"

"Saw something about that, yeah."

"So that's an example, right? Here's a big incident, and the first response is all about identifying who was behind it and rebuilding the defenses."

"Sure," Alex said. "You'd want to do that, right?"

"So figuring out exactly what was lost in the attack is on someone's to-do list, but it's not the top. And with all the shit going on, it may never get to the top. And everyone kind of knows that, even if they aren't saying it."

Alex drank, put down the bottle, and wiped his mouth with the back of his hand. "So if there's a profiteer on the base, they could take the opportunity to lift some equipment that survived, sell it on the black market, and call it lost."

"Exactly. I mean to some degree, that's always happening, but right now, with things a little chaotic and getting weirder all the time?"

"And with Mars losing a lot of its people to colony ships."

"Yeah, that too," Bobbie said. Her expression was hard. Alex sat forward, his elbows on the table. The smell of trout and black sauce still hung in the air, though the plates were gone by then. On the screen at the front of the restaurant, a young woman in a parody of business wear danced to a computer-generated pop tune. Alex hadn't been able to make out the language; at a certain speed every language sounded equally meaningless.

"You're telling me that you're investigating the sources of black market military equipment flowing off Mars."

"Weapons," Bobbie said. "Medical supplies. Ammunition. Power suits. Even ships."

"And you're doing it on your own, for fun, because of something Chrisjen Avasarala said to you."

"I'm kind of working for her."

Alex laughed. "I'm almost afraid to point this out, but you started off saying you needed a favor. You haven't told me what the favor is."

"A lot of the guys on Hecate won't talk to me. I'm a marine, they're Navy. There's that whole thing. But you know them, and even if you don't, you're one of them in a way I'm not going to manage this lifetime. I was wondering, as a favor, if you could help me dig a little."

Alex had nodded at the time, but what he'd said was "Let me think about it."

And now, because it was Bobbie and because he needed something in his life to actually have a moment of real closure, he was going to see her one last time to tell her the answer was no. He had a ship to get back to. If there was something he could do for her from there, he'd be pleased to lend a hand. His first priority now was getting off Mars and not coming back.

He reached the end of her corridor. The iron lanterns were glowing, creating the illusion of a street back on Earth centuries before. The echo of a place that neither he nor Bobbie had ever been, and still it was pleasant and comforting. He walked slowly, listening to the almost-silent chucking of the recyclers as if, just behind them, he could catch the murmur of the flowing Thames.

Somewhere nearby a man shouted once and briefly. It was Innis Shallow after all. Alex walked a little faster. At Bobbie's door, he paused.

It was closed, but not solidly. A black smudge, perfectly round and dented into the flesh of the panel, marked it just where the latch met the frame. A thin line of light at the door's edge showed where the frame had bent, the ceramic shattering. The man's voice came again, a low mutter rising to a final, powerful snap. It was coming from inside Bobbie's rooms.

Alex's heart beat triple time as he pulled out his hand terminal and tapped quickly, quietly to the local system's emergency services link. He thumbed in an alert request and a confirmation, but didn't fill in the details screen. There wasn't time for it. He stood before the door, his hands in fists, wishing as hard as he'd ever wished anything that Amos was there too.

He pushed the door open and rushed in.

Bobbie was at the table, sitting in one of the two chairs. Her arms were behind her. Her legs were splayed out before her, too long for the chair to accommodate. There was blood on her mouth and down the side of her neck. A man in gray coveralls was pointing a gun at the back of her head.

Two other men, dressed in the same gray, turned toward Alex. Both of them had automatic pistols in their fists. A fourth man, this one in a causal

suit the color of ash and a bright blue shirt, turned to Alex, his expression equal parts surprise and annoyance. When he saw Alex, his eyes went wide.

“Fuck!” the man in the suit said, the syllable almost lost in the noise of cracking wood. Bobbie moved faster than Alex could follow, shrugging the chair she was bound to into splinters and grabbing the gunman behind her by the wrist. He screamed and something wet happened to his arm.

One of the pistol men fired wildly, the stuttering report assaulting Alex’s ears. He rushed forward shouting and barreled into the man in the suit. Together, they staggered back. The other man’s knee rammed into Alex’s groin, and the world dissolved into blinding pain. Alex slid to his knees, trying to hold the man by his suit jacket. The guns continued their barrage and the stink of spent powder filled the air.

The man in the suit dug for a shoulder holster, and Alex grabbed his arm. The man’s wrist was like holding concrete. There was a gun in his fist. Someone shouted, and the roar of gunfire became the roar of something else, deeper and more animal. Alex pulled himself forward, the pain in his testicles fading to merely excruciating. He bit the solid wrist, sinking teeth into the raw silk sleeve and digging until his incisors met. The man in the suit didn’t even cry out, just brought his other hand down hard on Alex’s temple.

Everything got a little quieter, a little more distant. Alex felt his grip slip off the man’s arm, felt himself falling back, landing hard on his tailbone. The pain was there, but foggy. The man in the suit lifted his pistol to point at Alex. The barrel looked wide as a cave.

Oh, Alex thought, I die like this.

The man’s head twitched forward in a curt nod and he crumpled. Then it was Bobbie standing before him, a six-kilo free weight curled in one hand. The chrome had blood on it and what looked like hair. No one was shooting guns anymore.

“Hey,” Alex said.

“You all right?” Bobbie asked, sitting next to him. One of the gunmen staggered past her, cradling his forearm, and bolted out the door. She didn’t go after him.

“Little achy,” Alex said, then rolled to his side and retched.

“It’s okay,” Bobbie said. “You did really well.”

“Been a long time since hand-to-hand. I probably could have done better

if I'd had some practice.”

“Yeah, well. There were four of them with guns and two of us without. All things considered, we did okay.”

She blew out a long breath, her head sinking low. Alex tried to sit up.

“You all right?”

“Got shot a couple times,” she said. “Smarts.”

“Shit. You're hurt?”

“Yeah. I'm going to get over to the console there in a minute. Call emergency services before blood loss makes me woozy.”

“I already did that,” Alex said. “Before I came in.”

“Good planning.”

“Not sure planning had much to do with it,” Alex said. And then, “Bobbie? Stay with me here.”

“I'm here,” she said, her voice sleepy. “I'm all right.”

In the distance, Alex heard the rising tritone of sirens. Breath by breath, they grew closer. For a long moment, he thought the deck was being shaken, then realized it was just his body, trembling. At the side of the room, one of the gunmen lay slumped against the wall. His neck was at a strange angle, and blood was drying on his chest. He wasn't bleeding though. Dead, then. The man in the suit coughed and gagged, choking. The sirens got louder. There were voices now too. A woman identifying herself as police and warning them that people were coming in.

“I was coming to tell you,” Alex said. “I'll stay. I'll help.”

“Thanks.”

“This was about the black market stuff, wasn't it?” Alex said. “I guess you've been asking the right questions.”

Bobbie managed a smile. Looking at her now, there was a lot of blood on her shirt.

“Don't know,” she said. “All they asked me about was you.”

Chapter Twelve: Amos

Want some coke?" Erich asked. "Not synth. Real stuff that came from a plant."

"Nope. But I'd take a drink if one is handy," Amos replied. The pleasantries were just ritual, but ritual was important. In Amos' experience the more dangerous any two people were, the more carefully polite their social interactions tended to be. The loud, blustering ones were trying to get the other guy to back down. They wanted to stay out of a fight. The quiet ones were figuring out how to win it.

"Tatu, bring the El Charros," Erich said, and one of the two guards slipped out the door. To Amos he added, "Been on a tequila kick lately."

"I haven't," Amos said. "Earth is still the only place you can get good tequila. The Belter stuff is undrinkable."

"Not a lot of blue agave up there, I guess."

Amos shrugged and waited. Tatu returned with a tall skinny bottle and two narrow shot glasses. Erich filled both then lifted one in salute.

"To old friends."

"Old friends," Amos repeated and tossed back his shot.

"Another?" Erich asked, pointing at the bottle.

"Sure."

"Seen much of the neighborhood?"

"Just what was between here and the train station."

"Hasn't changed much," Erich said, then paused while they both drank off their shots. He refilled their glasses. "Faces change, but the corners stay the same."

"Funny, I was just thinking that same thing on my way in. Things have changed for you though."

“Not the important ones,” Erich said with a grin and wiggled his small, withered left arm.

Amos gestured at the room, the guards, the renovated building around them. “When I left, you were running for your life. So, at least one thing’s different.”

“You guys can go,” Erich said to Tatu and his partner. They slipped out quietly and shut the door behind them. That seemed like a good sign. Either it meant that Erich was sure Amos wasn’t there to kill him, or Erich had a way of protecting himself that didn’t require other people. It wouldn’t be a gun under the desk. That was too direct for Erich. Amos started casually scanning for wires or suspicious lumps on his chair or the floor beneath it.

Erich poured two more shots of tequila then said, “I learned something important from you, when you left.”

“Do tell.”

“I’ll never be the toughest guy in any room, unless I’m by myself,” Erich said, waving his small arm again. “But I’m usually the smartest. Executing a plan can be subcontracted out. Making the plan in the first place, not as much.”

“True enough,” Amos agreed. “It’s why I’ll never be the captain of a ship.”

Erich reacted to that. He didn’t change his expression or flinch, but Amos could see the words getting taken in and filed as important.

“But always useful, you,” Erich said. “You were always useful. You on a crew now?”

“You haven’t seen me in the news?”

“I have. You look different. Shaved your head, got your nose broke a few more times. But I’ll never forget a name.”

“Well, not this one anyway,” Amos said, and then tossed his shot back in a toast to Erich. “Gracias for that, by the way.”

“So, you still with that crew?” Erich said.

“I am. Why?”

“Because you’re sitting in my office right now drinking my tequila. Still playing that out in my head. Useful guy like you can always get work. If that’s what you want, I’ve got it. But if you’re not here looking for work, what are you looking for?”

Amos grabbed the bottle and poured himself another drink. Erich tried

very hard not to look nervous. He'd had a lot of practice, because he almost pulled it off. Time can change a lot. Erich had gone from twitchy little hacker with a price on his head to the boss of a respectable chunk of Baltimore's harbor-front property. But some things don't change. Some tells never go away. While Erich sat very still and looked him in the eye without blinking, the tiny hand on his deformed left arm opened and closed like a baby grabbing at a toy just out of reach.

"Went to Lydia's house," Amos said, sipping slowly at the tequila.

"Not Lydia's house anymore. She's dead," Erich said. "That what this is about? I treated her like you would have after you left."

"Yeah?" Amos asked, eyebrows going up.

"Well," Erich admitted with an embarrassed look to the side. "Not exactly like you would have."

"Thank you for that too," Amos said.

"You didn't kill me once when you had every reason to, and after that, you couldn't have stayed," Erich said, leaning forward. His left hand had stopped clenching. "Walking away from her was part of the favor you did for me. I never forgot that. And she helped me, at first. Helped me build what I have now. Taught me to use brains to beat brawn. She never lacked for a thing it was in my power to give."

"And I appreciate that," Amos repeated. Erich's eyes narrowed and his right hand came up from under the desk with a short-barreled automatic in it. Amos found himself surprised and a little proud of his friend. Erich rested his hand on the desk, the gun pointed away from Amos, more a warning than a threat.

"If you've got some beef you came here to settle," Erich said, "you won't be the first guy to leave this office in a bag."

Amos raised his hands a little in mock surrender. "Not even armed, chief. I came here to talk."

"So talk."

"What you did for Lydia was real nice," Amos said, putting his hands back down slowly but keeping his eye on the gun. "But you're wrong. She's not all dead. Some of her's left."

Erich cocked his head to the side, frowning. "Gonna need to walk me through that one."

"There's an old man loved her and lived with her and kissed her

goodnight before she died. A house with a little rose garden they worked together. Maybe some dogs. I saw a picture, but not sure if they're still around."

"I still don't get it," Erich said.

Amos rubbed his thumb against his knuckle, trying to find the words. It wasn't a thought he'd said out loud before, and if he screwed it up and Erich misunderstood, there was a chance they'd wind up trying to kill each other. So it was worth thinking about some.

"It's like this. The old man keeps the house until he dies. He's the only thing she left behind. He's the last bit of her. He keeps the house."

Erich put the little gun flat on the desk and poured himself another drink. He leaned back, holding the glass with his right hand. He couldn't pick the weapon back up without dropping the drink and he couldn't do that faster than Amos could reach him. It was a signal, and Amos felt the tension leave the muscles in his neck and shoulders.

"That's more sentimental than I would have guessed," Erich said.

"I'm not sentimental about much," Amos agreed. "But when I am, I'm pretty passionate."

"So I've heard the request. What's the payoff for me? I had something of a debt to Lydia, but I don't owe the old man shit. What does this win me, I keep him on the dole?"

Amos sighed, and gave his oldest friend a sad smile. "Really?"

"Really."

"I don't kill you, kill those two guys outside. I don't dismantle this organization from the top down and rebuild it with someone who'll owe me a favor."

"Ah," Erich said. "There he is."

Amos had to admit, Erich had grown some stones. He didn't even look down at the gun on the desk as he was being threatened. Just gave Amos his own version of the tragic smile.

"There who is?" Amos asked.

"Timmy."

"Yeah, I guess. It wouldn't be my first choice, though. So how's this go?"

"Costs me almost nothing to keep the old man's house," Erich said, then shook his head as if disagreeing with himself. "But even if it did, I'd still do

it. Just to keep Timmy off my streets.”

“Again, thanks.”

Erich shooed the gratitude away with a wave of his good hand, then stood up and walked to the office’s large screen pretending to be a window. The gun still lay on the desk, ignored now. Amos considered it briefly, then leaned farther back in his chair and put his hands behind his head, elbows spread out wide.

“Funny, right?” Erich said, pointing out the window at something Amos couldn’t see. “All those new faces and old corners. Shit changes and doesn’t. I did, you didn’t.”

“I live on a spaceship and fight alien monsters sometimes,” Amos said with a shrug of his elbows. “So that’s different.”

“Anything out there scarier than a hype with no money when you’re holding his fix? Scarier than a street boss thinks you skimmed?” Erich laughed and turned around, putting his back to the window. “Fuck that. Anything out there scarier than a life on basic?”

“No,” Amos admitted.

“So you got what you wanted,” Erich said, his voice going flat and dead. “Get the fuck out of my city or it’s open season.”

Amos stood. He was closer to the gun than Erich now. Could feel it pull at him like gravity. He could pick it up, kill Erich, kill the two guards waiting outside. By the end of the day he’d own a chunk of Erich’s old territory and have the muscle and credibility to take the rest. In a flash, the whole scenario played out in his mind.

Instead, he hooked his thumbs in his pants pockets and backed toward the door. “Thanks for the drink,” he said. “I forgot how good tequila was.”

“I’ll have Tatu give you a couple bottles on the way out. To take with you,” Erich said.

“Shit, I won’t turn that down.”

“It was good to see you,” Erich said, then paused a moment. “The gun was empty.”

“Yeah?”

“Fléchette turret hidden in the light,” Erich said, with a flick of his eyes at the inset LED housing above them. “Poisoned darts. I say a word, it kills everyone in the room isn’t me.”

“Nice. Thanks for not saying it.”

“Thanks for still being my friend.”

It felt like goodbye, so Amos gave Erich one last smile, and left the room. Tatu was waiting in the corridor with a box full of tequila bottles. The guards must have been monitoring the whole thing.

“Need help on your way out?” the guard asked.

“Naw,” Amos replied and hoisted the box over one shoulder. “I’m good at leaving.”

Amos let his hand terminal take him to the nearest flophouse and got a room. He dumped his booze and bag on the bed and then hit the streets. A short walk took him to a food cart where he bought what the sign optimistically called a Belgian sausage. Unless the Belgians were famous for their flavored bean curd products, the optimism seemed misplaced. Not that it mattered. Amos realized that while he knew the orbital period of every Jovian moon by heart, he had no idea where Belgium was. He didn’t think it was a North American territory, but that was about the best he could do. He was hardly in a position to criticize assertions about their cuisine.

He walked toward the old rotting docks he played on as a child, not for any reason more profound than needing a destination and knowing which direction the water was. He finished the last of his sausage and then, not seeing a convenient recycling bin, he chewed up and swallowed the wrapper too. It was made of spun corn starch and tasted like stale breakfast cereal.

A small knot of teens passed him, then paused and turned to follow. They were in that awkward age between being a victim on legs and capable of real adult crimes. The right age for petty theft and running for the dealers mixed with the occasional mugging when opportunity presented itself without too much risk. Amos ignored them and climbed down onto the rusting steel of an old bayfront jetty.

The teens hung back, arguing in quiet but tense voices. Probably deciding if the reward of a solitary mark with an outsider’s credit balance—it being an article of faith that anyone from outside the docks of Baltimore had more money than anyone in them—was worth the risk of taking on a

man of his size. He knew the calculus of that equation well. He'd been in on that very argument himself, once upon a time. He continued to ignore them and listened instead to the gentle lap of the water against the pilings of his jetty.

In the distance, the sky lit up with a line of fire like a lightning bolt drawn with a ruler. A sonic boom rolled across the bay a few moments later, and Amos had a sudden and intense memory of sitting on those very docks with Erich, watching the rail-gun supply lifts fired into orbit, and discussing the possibility of leaving the planet.

To everyone outside the gravity well, Amos was from Earth. But that wasn't true. Not in any way that mattered. Amos was from *Baltimore*. What he knew about the planet outside of a few dozen blocks of the poor district would fit on a napkin. The first steps he'd ever taken outside the city were when he'd climbed off a high-speed rail line in Bogotá and onto the shuttle that had flown him to Luna.

He heard quiet footsteps on the jetty behind him. The discussion was over. The yeas outweighing the nays. Amos turned around and faced the approaching teens. A few of them held improvised clubs. One had a knife. "Not worth it," he said. He didn't flex or raise his fists. He just shook his head. "Wait for the next one." There was a tense moment as they stared at him and he stared back. Then, moving as though they'd reached some sort of telepathic consensus, they drifted away in a group.

Erich was wrong about him being the same. The man he'd once been wasn't a collection of personality traits. He was the things he knew, the desires of his heart, the skills he had. The person he'd been before he left knew where the good basement booze was brewed. Which dealers had a consistent supply of quality black market marijuana and tobacco. The brothels that serviced the locals, and the ones that were there only to rob thrill-seeking poverty tourists. That person knew where to rent a gun for cheap, and that the price tripled if you used it. Knew it was cheaper to rent time in a machine shop and make your own. Like the shotgun he'd used the first time he killed a man.

But the person he was now knew how to keep a fusion reactor running. How to tune the magnetic coils to impart maximum energy to ionized exhaust particles, and how to fix a hull breach. That guy didn't care about these streets or the pleasures and risks they offered. Baltimore could look

exactly the same, and be as foreign to him as the mythical land of Belgium.

And in that moment, he knew it was his last time on Earth. He was never coming back.

He woke up in his rented flop the next morning with half a bottle of tequila on his nightstand and the first hangover he'd had in years. For a moment he thought he'd been so drunk he wet the bed, but realized that in the stifling heat of the room he'd sweated out about a liter. His throat felt dry and his tongue swollen.

He rinsed off the night's sweat and drank steaming-hot water out of the shower, tilting his head back to let it fill his mouth. After decades of filtered and sterilized ship and space station water, he marveled at all the *flavors* in it. He hoped not too many of them were microbes or heavy metals.

He pulled the remaining tequila bottles out of their box and stuffed them into his duffel bag, wrapping his clothes around them to protect them. Then he picked up his hand terminal and started looking for a hop back to Luna, then a connecting long flight to Tycho. He'd said goodbye to Lydia, or the pieces of her that she'd left behind anyway. He'd said a goodbye of sorts to Erich. There was no one left on the entire planet he gave half a shit about.

Well, no. That wasn't true. Maybe *half*.

He called the number Avasarala had used, and a sculpted young man with a perfect haircut, pale skin, and gigantic teeth appeared. He looked like an expensive store mannequin. "Secretary Avasarala's office."

"Gimme Chrissie, kid, and make it snappy."

The mannequin was stunned into silence for two long breaths. "I'm sorry, but the secretary can't—"

"Kid," Amos said with a smirk, "I just called on her private line, right? My name is Amos Burton." A lie, but one he'd told often enough it had become a sort of truth. "I work for James Holden. I bet if you don't tell her I'm on the line right now that you're applying for basic by the end of the day."

"One moment please," the mannequin said and then the screen displayed the blue-and-white logo of the UN.

“Burton,” Chrisjen Avasarala said, appearing on the screen less than thirty seconds later. “Why the fuck are you still on my planet?”

“Getting ready to leave, chief, but figured I got one more person to check in on before I go.”

“Was it me? Because I don’t like you enough to consider that charming. I have a flight to Luna waiting on the pad for me so I can go do fucking party arrangements before the Martian prime minister arrives.”

“They make you do that?”

“I do everything, and every second I talk to you costs ten thousand dollars.”

“Really?”

“No, I just made that number up. But I fucking hate flying to Luna so I’ve been putting it off to finish other work anyway. Do you need a ride? If it gets you off my planet, I can give you a ride. What? Did I say something funny?”

“Naw, just reminded me of somebody,” Amos said. “Anyway, I get the feeling this is the only trip down the well I’m ever going to take.”

“I’m crushed,” she said.

“Since I’m here, I figured anything I might want to do, better do it now. Anyone I wanted to see, you know,” Amos continued. “Where did you guys wind up locking Peaches away?”

“Peaches?”

“The Mao girl. Clarissa. She flew with us for a few months back after she stopped trying to kill the captain. And I have to admit, she grew on me a little.”

“You fucked your prisoner?” Avasarala said, her expression evenly divided between amusement and disgust.

“Nah,” Amos said. “I don’t tend to do that with people I like.”

Chapter Thirteen: Holden

The systems that the gate network had opened up were scattered across what everyone was pretty sure was the Milky Way galaxy. Cartography was still working out their relative locations, but even the initial findings put some of the new systems tens of thousands of light-years from Earth and with some distinct weirdness about time and location. Confronted by such unimaginably vast distances, it was easy to forget how much space was in just one solar system. Until you tried to find something in it.

Legally, any spaceship on the move had to register a flight plan and run an active transponder. That made ships traveling from place to place relatively easy to track. And with a transponder pinging away so you knew where to point your telescope, an active drive was visible from across the solar system. But ships would power down for repairs in dock, so transponders disappeared off the grid all the time. Ships were decommissioned, so a transponder might go black and never return for entirely legitimate reasons. Newly commissioned ships showed up with brand-new names and ships that were sold registered name changes. Some were cobbled together from scrap, some were built in shipyards, some were salvaged. And all of it was happening scattered across roughly one hundred quintillion square kilometers of space, give or take a few quadrillion. And that was only if you ignored that space had a third dimension.

So, seventeen ships had vanished going through ring gates, and if Holden was right, they were probably back in the home system with new names. In theory, there was a path to the information he wanted, but unless he was interested in spending several hundred lifetimes sifting through the raw data, he'd need help.

Specifically, he needed a computer plowing through a number of

different massive databases on new ships, decommissioned ships, sold ships, repaired ships, and lost ships, looking for anything that didn't add up. Even with a good computer and very smart data sorting software, it was what a programmer would call a nontrivial task.

And, unfortunately, the best software engineer that Holden knew had flown off to parts unknown and wasn't answering his messages. He didn't have the skills to do it himself, the time to learn them, or a crew to do it for him. What he had, was money.

After his shift working with Sakai's people on the *Roci* refit, Holden called up Fred yet again. "Fred, hey, I have a software problem. Can I hire some of your programming wonks for a short-term gig?"

"Your ship need an update?" Fred asked. "Or is this something that will piss me off?"

"Something that'll piss you off. So, who's available for custom script writing?"

Paula Gutierrez had the elongated body and slightly oversized head of a low-g childhood. Her smile was sharp and professional. She was a freelance software engineer who'd taken a six-month consulting job on Tycho five years before and then just stayed on the station picking up the odd bit of piecework. On Holden's hand terminal, her wide face filled the screen with dark bushy eyebrows and blindingly white teeth.

"So, that's what I'm looking for, and I need it as fast as possible," Holden said after laying out his requirements. "Doable?"

"Very," Paula said. "Tycho keeps all the traffic databases mirrored local, so don't even have to sweat the lag. Gonna cost you for speed, though."

"Cost me what?"

"Fifteen hundred an hour, ten hours minimum. Know up front I don't argue about billing and I don't give discounts."

"That," Holden said, "sounds like a lot."

"That's because I've got you over a barrel and I'm gouging the shit out of you."

"Okay, how soon will I start seeing output?"

Paula shrugged with her eyebrows, then looked down at something off camera. “Call it twenty hours from now before you start getting data sent to you. Want me to collate or stream it as it comes in?”

“Send it straight to me, please. Going to ask me why I want it?”

Paula laughed. “I never do.”

Monica was renting a small suite of rooms on the visitors’ level of Tycho. They were expensive, and to Holden’s surprise, not any nicer than the company quarters Fred had set aside for his crew. Not many companies treated their own as well as they treated guests. But courtesy dictated that he act like the rooms were something special to make Monica feel good about the investment, so he made impressed noises at the open spaces and quality of the furnishings.

“So what did Fred say?” Monica asked once he took a seat at her dining table and sipped at the tea she’d made.

“He doesn’t think there’s much to go on, honestly.”

“I mean about using the protomolecule sample to try and get in touch with Detective Miller.”

“Yeah,” Holden replied, putting the tea back on the table and pushing it away. The first sip had left his tongue feeling scalded and rough. “I mentioned that but only so he’d know he had a leak somewhere. That was always a nonstarter as an investigation tool. No one’s letting that shit out of its bottle anytime soon.”

“Then I’m wasting my time here, is what you’re saying.”

“No,” Holden said. “Not at all. I think the missing ship thing is legitimate. I just don’t think it’s an alien conspiracy. It’s much more likely to be associated with this hard-line OPA wing. I’m looking into it, if that’s a story you want to pursue.”

Monica spun her hand terminal around on the tabletop, already impatient with him for changing the subject. “I made my name with the story on the *Behemoth*. Aliens and wormhole gates and a protomolecule ghost that only talked to the most famous person in the solar system. I don’t think my follow-up to that can be *Humans Still Shitty to Each Other*. Lacks

panache.”

“So, is this about finding those missing ships? Or is it about finding another batch of alien weirdness to make you more famous?”

“That sounded awfully judgmental for a guy who’s managed to shoehorn himself into every major news piece for the last six years.”

“Ouch,” Holden said, then let the uncomfortable silence stretch a while. Monica kept spinning her hand terminal but not looking him in the eye.

“Sorry,” she finally said.

“It’s okay. Look, I’m going through this weird empty-nest thing, and it’s left me kind of restless. And because I’m looking to latch onto something, I’m going to go find those missing ships. Probably won’t be an alien conspiracy, but I’m going to do it anyway. Want to help?”

“Not sure what that looks like, to be honest. I was hoping to just ask the omniscient aliens. Do you know how big space is?”

“I’ve given it some thought,” Holden said. “I have this plan. I talked to Fred about the OPA angle, but he doesn’t like that idea so he’s rejecting it out of hand. Still, that got me thinking. The OPA isn’t going to throw a bunch of ships away. Belters just don’t think that way. They recycle everything.”

“So?”

“So how do you find pirated ships? Chief Engineer Sakai suggested looking for the new ships that turn up rather than hunting the missing ones.”

“*Sakai* suggested...”

“He’s a guy I work with on the *Roci* refits. But anyway, I thought that sounded like a great idea so I hired a local data wonk to write a database mining script to track all the new ship names that show up on the registries and try to find an origin point.”

“A data wonk.”

“Freelance coder. Whatever the name is for that kind of work, yeah, and anytime now I’ll start getting a stream of data that includes all the mysteriously appearing ships. Our missing seventeen should be a subset of that. At least it’ll be a smaller number of ships than, you know, *all* of them.”

Monica stood up and walked away several steps, not speaking. Holden blew on his tea and waited. When she finally turned back around, the look on her face was carefully controlled incredulity. “You’ve involved Fred Johnson, some engineer here on Tycho, and a fucking *hacker* in this? Are

you that stupid?”

Holden sighed and stood up. “I first heard about this from you, so I’ll do you the courtesy of letting you know where the investigation goes—”

“And now you’re *leaving*?” The incredulous look on Monica’s face only deepened.

“Well, funny thing. I don’t have to put up with being called stupid by someone I’m trying to help.”

Monica lifted her palms in a placating gesture that he suspected she didn’t really mean.

“Sorry,” she said, “but you just involved three new people, one of whom is the highest-profile member of the OPA, in my... *our* investigation. What on earth made you think that was a good idea?”

“You know me, right?” Holden said, not sitting again but not heading straight for the door either. “I’m not a guy who hides things. I don’t think Fred is the bad guy, but if he is then his reaction to our searching will tell us something. Secrecy is the potting soil in which all this conspiracy shit grows. Trust me. The roaches don’t like it when you start shining a light on them.”

“And what if they decide to get rid of the guy with the light?”

“Well,” Holden said with a grin, “that’ll be interesting too. They won’t be the first ones to try, and I’m still here.”

The following day the data from Paula’s program began trickling in. He authorized his terminal to transfer the remaining payment for her services and began going through the list.

Lots of new ships were showing up around Mars and Earth, but that was to be expected. The shipyards were cranking out new and refurbished vessels as fast as the mechanics and engineers could make them. Everyone with two yuan to rub together was making a play for the ring gates and the worlds beyond them, and the biggest group of people who like living on planets and were already physiologically adapted to it came from the two inner worlds. Only a tiny fraction of those ships had gaps in their records that Paula’s program would flag, but even a brief search led Holden to

believe that the flagged ships were mostly paperwork errors, not piracy.

There were also a scattering of suspicious new ships in the Belt. Those were more interesting. If the OPA was stealing ships, then the logical place to hide them was in a region of space thick with ships and other metallic bodies. Holden began going through the Belt list one ship at a time.

The *Gozerian* appeared out of nowhere in the docks at the Pallas refinery in the right date range. The records listed it as a probate transfer, but were vague on who'd died and what relation the new owner had to the old. Holden guessed the answer to those two questions was *person who used to own the ship* and *person who killed them and took it*. The transfer of ownership was sketchy enough that it almost certainly was the result of piracy, but the *Gozerian* was listed as a non-Epstein light-hulled mining ship. A rock hopper. The records from Pallas backed that up, and a search of the list of seventeen missing ships didn't turn up anything matching its description. No one was going to make a run for the edge of the solar system and then all the way in to a new world in something that didn't have an Epstein drive. There were much more comfortable places to die of old age.

Holden checked the *Gozerian* off his list and moved to the next. By the time he'd gone through the entire initial list from Paula it was three a.m., Tycho time, and his shift on the *Roci* started at eight, so he caught a couple hours of rack time and spent a miserable morning trying to trace maneuvering thruster cables through a fog of sleep deprivation.

By the time his shift was over all he could think about was a little dinner and a lot of sleep, but the data stream from Paula was waiting for him with nearly fifty new ships. So he picked up a carton of noodles on his way home and spent the rest of the evening going through the list.

The *Mouse Pie* was a gas freighter and didn't match his missing list. The *Vento* first appeared before the date range he was interested in, and a query to the last dock it had visited confirmed the dates were correct. The *Blasphemous Jester* was listed as Epstein equipped, but a search of the service records showed that the drive had been out of commission for years. Someone had been using it as a short-hop shuttle in teakettle mode ever since.

On and on and on through the names it went. At one point his terminal beeped with an incoming message. Amos checking in with a cryptic

“Visited my friend’s grave. Went okay, but still got some shit to do. Back later.” Holden slurped up another mouthful of noodles that had long since gone cold and now had the consistency of earthworms. How had Miller done shit like this for a living, he wondered. It was shocking to realize how much of investigation was just brute-force solutions. Going through endless lists looking for one thing that doesn’t fit. Talking to every single potential witness over and over. Pounding the pavement, as the gumshoes in Alex’s neo-noir movies might say.

It was thinking about Alex that twigged his memory, and he went back through the list until he found a ship designated the *Pau Kant*. The last location was marked as 434 Hungaria. A high albedo rock in the Hungaria group, an asteroid group relatively close to the orbit of Mars but with a high inclination. Mars control had caught a ping from the *Pau Kant* and then lost it shortly after. They’d marked the ship as missing.

But prior to that single and short-lived appearance, the *Pau Kant* didn’t seem to exist in any other records. He couldn’t find any description of her hull type or drive. Nor were there any owner records he could track down. He’d moved it to his list of ships to look into later, but something about Mars and inner Belt asteroids was making his brain itch.

The Hungaria group wasn’t a terrible place to hide things. 434 Hungaria was about twenty kilometers across. Plenty of mass to mask ships from radar, and the high albedo of the group would clutter up the results of anyone looking for ships with a telescope. The location was intriguing too. If the OPA radicals were collecting ships to pirate colony transports, the inner Belt was not a bad staging area. They’d also launched an attack on Earth in the recent past. That it had failed didn’t mean they weren’t planning more. A bunch of stolen ships hiding in the inner ring was exactly the sort of first step another attempt might take.

The Hungaria asteroids were a long way from Tycho’s current location, and Holden didn’t have a ship. But they were pretty close to Mars, and Alex was there. If he had access to a ship, it wouldn’t be too long a trip to go take a peek. See if the *Pau Kant* was still out there, tethered to the rock and staying dark. And if it matched any of Monica’s missing ships? Well, that would be interesting to take back to Fred.

Holden put his terminal on the table, angled up to record his face, and said, “Alex. Hey, hope things are going well out there, and that Bobbie is

good. So, I've been looking into this thing with missing ships? And there's a suspicious hit out at 434 Hungaria. Any chance you have access to a ship? If you need to rent one, feel free to pull the funds from my account. I'd like you to go see if a ship named the *Pau Kant* is sitting out there parked and dark. Specs on the transponder code attached to this message."

He put all the information he had on the *Pau* and its most recent location from the Mars control records into a file. It wasn't much to go on, and it felt like a long shot, but Alex would enjoy the flight and Holden was willing to foot the bill so he didn't feel too bad about asking.

He was pretty sure the burst of energy that came from having made progress would be short-lived, but he wanted to share his success and felt wide-awake, so he called Monica. He got her voice mail. He left her a message to call him back, slurped down the last of his cold and nasty noodles, and immediately fell asleep on his couch.

The next morning he wasn't on the duty roster to work on the *Roci*, and Monica hadn't called him back, so he called again. No answer. On his way to breakfast he dropped by her apartment, but she wasn't there either. She'd been a little miffed at him, but he didn't think she'd bail on the whole missing ship story without saying anything. He made another call.

"Tycho security," a young male voice said.

"Hey, this is Jim Holden. I'm checking on a visiting journalist, Monica Stuart. Has she left the station?"

"One sec. No. Records list her as still on board. Her apartment is—"

"Yeah, actually? I'm at her apartment right now and she's not answering here or on her hand terminal."

"My records show that her terminal hasn't connected to Tychonet since early yesterday."

"Huh," Holden said, frowning at her door. The quiet on the other side had taken on an ominous feel. *What if they decide to get rid of the guy with the light?* He wasn't the only one who fit that description. "So she hasn't so much as paid for a sandwich in over a day. That strikes me as not good."

"Want me to send a team?"

"Please do that."

By the time the security team arrived and opened the door to Monica's apartment, Holden was expecting the worst. He wasn't disappointed. The rooms had been methodically searched. Monica's clothes and personal

effects were scattered across the floor. The hand terminal she used for interviews had been crushed under someone's heel, but the screen still flickered when Holden touched it. The team found no traces of blood, which was about the only positive sign.

Holden called Fred while the team finished their forensic sweep. "It's me," he said as soon as the OPA chief answered. "You've got a bigger problem than radicals on Medina."

"Really?" Fred said, his voice weary. "And what is that?"

"You've got them on Tycho."

Chapter Fourteen: Naomi

Terryon Lock was supposed to be a new kind of place in the emptiness of the Jovian system. A Belter home world, they figured. Modular, so it could grow or contract at need. Outside the control of Earth or Mars or anybody. A free city in space, with its own governance, its own environmental controls. Naomi had seen the plans when they first spilled out over the networks. Rokku had them printed on thin plastics and stuck to the walls of the ship. Terryon Lock was the new Jerusalem until the security forces at Ganymede shut it down. No colonies without permission. No homes. No safe havens, not even if they built it themselves.

She hadn't even been pregnant when it happened. She didn't know that it would define her.

Filip was eight months old when the *Augustín Gamarra* died. The *Gamarra* had left Ceres Station, burning for a Coalition Navy research station on Oshima with a payload of organics and hydroponic equipment. Ten hours out, burning at a leisurely one-quarter g, the ship's magnetic bottle lost containment, spilling the fusion core into the ship. For a fraction of a second, the *Gamarra* had been as bright as the sun and two hundred thirty-four people died. No wreckage survived, and the official investigation into the event had never been closed because no conclusion could be reached. Accident or sabotage. Mischance or murder.

They had gone from the hidden cell at the back of the club to a private apartment up even nearer the center of spin. The air had the too-clean ozone smell of a recently replaced recycling filter. Filip sat at the small table, his

hands folded. She sat on the edge of the tiny foam-and-gel sofa. She looked at the boy's dark eyes and tried to connect them in her mind with the ones she remembered. His lips with the toothless, delighted smile. She couldn't tell if the resemblance was really there, or if it was only her imagination. How much did someone change between not-quite-a-toddler and not-quite-an-adult? Could it really be the same boy? It wasn't anyone else.

The hole wasn't abandoned. There were clothes in the locker, food and beer in the little refrigerator. The pale walls showed chips at the corners where the damage of minor accidents had built up over the course of years. He didn't tell her who the apartment belonged to, and she didn't ask.

"Why didn't you bring the *Rocinante*?" Filip asked. There was a tentative quality to his voice. Like the question was only a stand-in for other ones he wanted to ask. That she wanted to be able to answer. *Why did you go? Didn't you love us?*

"It's in dock for repairs. Will be for months."

Filip nodded once, sharply. She could see Marco in the movement.

"That's going to complicate things."

"Marco didn't tell me you wanted the ship," Naomi said, hating the implicit apology in the words. "All he said was that you were in trouble. That you were avoiding the law, and that I could... that I could help."

"We'll have to come up with something," he said.

The hospitals at Ceres Station were some of the best in the Belt when Naomi had been coming near to term. Neither of them had the money to travel to Europa or Ganymede for the duration of a pregnancy. Ceres had been closer to Rokku's claims than Tycho Station. Childbirth was a greater danger for Belters than for someone who'd lived under constant gravity, and Naomi's pregnancy had already had two scares. She and Marco had lived in a cheap rental near the hospital, one of dozens that catered to Belters who came for the medical care. The terms of the agreement were open-ended, letting them stay until they didn't need the doctors, nurses, expert systems, and pharmaceuticals that the medical complex boasted.

Naomi could still remember the shape of the bed there, the cheap plastic

curtains with a printed starscape that Marco hung across the doorway. The smell of it made her sick, but he'd been so pleased with himself she'd tolerated it. And even that late in the process, almost everything made her sick. She'd spent her days sleeping and feeling the baby shifting inside her. Filip had been restless as a fetus. She hadn't felt like a child having a child. She'd felt like a woman in control of her fate.

"How many do you need to get out?" Naomi asked.

"Fifteen, all told."

"Including you?"

"Sixteen."

She nodded. "Any cargo?"

"No," he said, and then seemed about to go on. After a moment, he looked away.

Ceres had still been under Earth control back then. Most of the people living on the base were Belters who'd taken contract with one of the Martian or Earther corporations. Earth security by Belters. Earth traffic control by Belters. Martian bioresearch by Belters. Marco had laughed at it all, but the laughter had an edge. He'd called Ceres humanity's largest shrine to Stockholm syndrome.

Everyone flying with Rokku had paid part of their share into the OPA, Naomi included. And the OPA looked after them in the last days of her pregnancy, local women bringing food to the hole, local men taking Marco out to the bars so that he had someone besides her to talk to. Naomi didn't think anything of it apart from being grateful. Those nights when Marco was out drinking with the local men and she was alone in her bed with Filip, her mind moving in the silence had carried an almost transcendent contentment. Or at least that was how she remembered it now. At the time, without knowing what was still to come, the experience might have been

different.

“Where do you need to be?”

“We don’t talk about that,” Filip said.

Naomi brushed her hair back from her eyes. “You brought me here because it’s secure, sa sa? So is it that you don’t want to be overheard by someone else, or that you think telling me compromises you? Because if you don’t trust me enough to ask for what you want, you don’t trust me enough for me to be here.”

The words seemed to carry more nuance than they could bear, as if the simple logistical facts also meant something about why she’d left. About who they were to each other. It was like she could feel the words creaking, but she didn’t know what Filip heard in them, or what she should have said differently. For a moment, there was a flicker in his expression. Sorrow or hatred or pain, it was gone too quickly to identify. A new stratum of guilt settled onto her, bearing her down. Compared to what she already had, it was trivial.

“He said I should tell you once we were off the station,” Filip said.

“Apparently he didn’t know I’d be arranging passage on a different ship. Plans change. It’s what they do.”

Filip’s gaze fixed on her, his eyes hard as marbles. She realized she’d been quoting Marco without meaning to. Maybe Filip thought it was a slap, that she was making a claim on his father by using his words. She didn’t know. She didn’t know him. She had to keep reminding herself of that.

“There’s a rendezvous point.”

“Is there a time?”

“Yes.”

“How long?”

She saw *We don’t talk about it* floating in his eyes. When he spoke, his voice was smaller, younger. More vulnerable. “Soon.”

“How soon?”

He looked away.

“Very.”

She'd known, back then, that there were hard-core OPA factions on Ceres, but it hadn't bothered her. Radical OPA was still OPA, and that made them family. The crazy uncle who got drunk and started fights, maybe, but with Earth cranking up tariffs and Mars lowering the prices it would pay for ore, the sense of being under siege put Belters on the side of Belters first. And after shipping with Rokku for a while, talk of killing Earthers and Martians became a kind of white noise.

The birth had been hard. Thirty hours of labor. The muscles of her abdominal wall, made weaker by a lifetime of inconstant g, had shredded themselves. If they had been in Rokku's ship or even back on Hygeia Station, she might have died, and the baby with her. But the medical complex on Ceres had seen it all before, and worse. A gray-haired woman with a cathedral of tattoos on her hands and arms had been in her room the whole time, singing little tunes in Swahili and Arabic. Naomi could still see her and hear her voice, though she'd forgotten the woman's name. If she'd ever known it.

Filip had drawn his first, exhausted, angry breath at five in the morning, the day after she'd gone into the complex. The pediatric autodoc scanned him, considered for the longest five seconds of Naomi's life, and declared the baby safely within standard error. The gray-haired woman had placed him on Naomi's breast and sung a blessing.

It hadn't occurred to her then to wonder where Marco was. She had assumed he was in a waiting area somewhere, ready to pass out some equivalent of cigars as soon as news of her came. Of her and their son. Maybe that had even been true.

"Do we need to be there, or is off station enough?" Naomi asked.

"Off station at minimum. Better to be there, but not here solid."

"And where are we going?"

"Hungaria cluster." They were a group of minor asteroids. High albedo.

No station, but an open-access storage facility. As close to the inner planets as Belt rocks got.

“Are we meeting someone there?”

“Not there. There’s a ship a few days in. Sunward. But locked to Hungaria. *Pella*, it’s called.”

“And after that?”

Filip made the hand shrug of a Belter. Apparently she could know that much, but no more. She wondered what would happen if she pushed, and knew it was an experiment she wouldn’t make. *I’m sorry*, she thought. *I loved you more than I have ever loved anything. I would have stayed if I could. I would have taken you with me.*

Filip looked at her and then away.

She’d spent most of the weeks following the birth in recovery. The baby kept her from sleeping very long at a stretch, but apart from one week of frankly hellish colic, he was neither harder nor easier than she’d been led to expect. The worst thing she suffered was boredom, and Marco helped with that. The local group he’d been drinking with were mechanics and technicians at the port, and Marco brought her engineering problems that they were trying to solve. They were the sort of work consultants would do for half a month’s credit. She did them from goodwill and the need to do something intellectually challenging. While Filip napped in the little plastic crib, she customized diagnostic programs for water recyclers. She built virtual timing sequencers for shear force detection units. She designed software overrides for testing the containment limits of magnetic bottles.

The kind of limits that, before long, would fail on the *Gamarra*.

“All right,” Naomi said. “I’ll see what I can do.”

“Do you have access to another ship?” Filip asked.

“I may be able to charter something.”

“You can’t just hire a charter. This has to be untraceable.”

Meaning, she knew, that whatever was going to happen, it would mean people with guns coming after Filip and Cyn and all the others. Maybe security forces, maybe a rival faction, maybe something else that she hadn’t anticipated yet. But there would be consequences. And there would be violence.

“I may be able to charter something discreetly,” Naomi said. “If it doesn’t work, I’ll be sure it doesn’t come back to you.”

Filip swallowed. For a moment, she saw a glimmer of fear in him. He was sixteen years old now. A year younger than when she’d met his father. Three years younger than when she’d held him to her breasts to feed.

“I would have looked for you if he’d let me,” Naomi said. The words came out of her from a need she couldn’t control. He was a boy. He was carrying whatever burden Marco had put on him already. Making him responsible for how she felt too wasn’t a kindness. She rose to her feet. “You don’t need to do anything about that. Just I would have. If he’d let me.”

If he’d let me. The words were heavy and toxic as lead. *I would have done what I wanted, except he still controlled me. Still does. After all these years, and all these changes, and everything I have done and become, I wouldn’t have left you to him except that Marco still controls me. Constrains me. Punishes me for not letting him rule me outright.*

“All right,” Filip said. His expression was empty.

Naomi nodded. Her hands were in fists so tight the knuckles ached. She made herself relax. “Give me a day. I’ll know more.”

“Come to the club,” Filip said. “If we’re not there, just wait and we’ll make contact. We need to stay moving.”

I thought I could stay with you, she thought, and then hated herself for the disappointment she felt. This wasn’t a reunion. Her unfinished business with Filip might be what brought her here, but he was doing something else. Something that had brought his long-lost mother back into his world. If she wanted to sit with him and eat sweets and share stories the way they never had, that was her problem.

“Fair enough,” Naomi said. She hesitated, then turned to the door. As she reached it, he spoke again, his voice tight. Like the words were hard to say.

“Thank you for coming.”

She felt it in her sternum, someone taking a hammer to the bones over her heart. Filip watched her from the table. He looked so much like his father. She tried to imagine that she had ever been that young herself. Tried to imagine that at that age she would have known how to pick words that were that perfectly empty and heartwarming and cruel. She felt the smile press her lips out a millimeter. It was an expression of sorrow more than joy.

“He told you to say that,” she said. “Didn’t he?”

There were a hundred ways to unpack the boy’s silence.

After the *Gamarra*, Marco had come home drunk and happy from his celebration. She’d told him to be quiet, not to wake the baby. Marco had swooped her up in his arms, twirling her in the little room until her ankle hit the bed and she yelped with pain. He’d put her down then, rubbing the little injury. Kissing it. He’d looked up at her with a smile that asked as much as it promised, and she’d thought about whether they could make love quietly enough that Filip would keep sleeping. That was what she’d been thinking of when he destroyed her.

“Managed it, us. You, *que si*?”

“Managed what?” she asked, leaning back against the gel of the bed.

“Got even for Terryon Lock,” Marco said. “Stood up for the Belt. For us. For him.”

Marco nodded toward the baby. Filip’s thumb had been in his sleep-slack mouth, his eyes so closed they seemed like they’d never open again. She’d known before she understood what she knew. An electric cold washed her heart, her belly, all her body. Marco sensed it. The memory of his quizzical smile looking up past her knee was still burned in her mind.

“What did I manage?” she said.

“Perfect crime,” he said. “First of many.”

She understood. The *Gamarra* had been killed with her code. The people who died there were dead because of her, and all of Rokku’s rough talk and ranting had stopped being empty banter. Marco was a killer now.

She was too. They'd gone on to make love anyway, him too warm and dangerous to refuse, her too much in shock even to understand how much she wanted to object. She hated the fact, but they had. It was the beginning of the dark times, but looking back, all the rest of it—the depression, the fear, the loss of Filip, her failed suicide—had all been implicit in that night.

The script over the doors of hell, writ small.

Renting a hole by the port was easy. She had enough money to buy anonymous credit, route it through an off-station exchange, and bring it back to a mayfly shadow account. It only felt strange doing it because she hadn't had to go through those motions in so long. Not since she'd signed on to the *Canterbury*, and that felt like it had been seven lifetimes ago.

She sat on the thin gel bed and waited for the weeping and nausea to stop. They would, even though at the worst of it, they felt like they might not. Then she took a long shower, changed into a fresh set of clothes purchased from a kiosk. Watching the hard puck of compressed cloth expand into a jumpsuit reminded her of an insect pulling itself out of its shell. It seemed like it should be a metaphor for something.

Her hand terminal showed a half-dozen new messages from Jim. She didn't play them. If she had, the temptation to reply—to confess to him and take comfort in him, to talk to someone she trusted completely—would have been too much. And then he would have felt obligated to do something. To come and fix things. To insert himself into the messes that she'd made and the things she'd done. The distance between here and there, between Marco and the *Rocinante*, was too precious to sacrifice. The time for comfort would come later, when she'd done the things she needed to do. When she'd saved Filip. When she'd escaped Marco. So she didn't play the messages. But she didn't delete them either.

Even back on with Rokku, Marco had been cultivating himself as a leader.

He'd been good at it. No matter how bad things got, he'd always managed to make it seem like each new hurdle was something he'd factored in, every solution—even ones he'd logically had nothing to do with—was somehow his brilliance. He'd explained once how he managed it.

The trick, he said, is to have a simple plan that more or less can't go wrong so that you always have something, and then stack your risks on that. Have another alternative that won't work but maybe one time in a hundred, and if it happens, you look like a god. And then one that won't work but one time in twenty, that if it lands you look like you're the smartest one in the room. And then one that's only one time in five, but you look like you knew you could do it. And if everything else fails, you've still got the one that would always win.

If there was a single phrase for Marco, that was it: always win.

She wondered more than once over the years where she'd been on that scale. Had she been his one-in-a-hundred or his sure thing? She'd never known, and there was no way that she ever would. It didn't even matter to her anymore, except the way a missing finger itched sometimes.

And now here she was again, doing what he wanted. He'd made her complicit in his plans, whatever they were. This time, though, she knew who she was dealing with. She wasn't the girl who he'd tricked into sabotaging the *Gamarra*. She wasn't a love-struck teenager in over her head. And Filip wasn't a baby that could be spirited away and held as hostage against her good conduct. Her silence.

And so maybe—*maybe*—this was the moment she'd wanted. Maybe calling her in was Marco's mistake. She pushed the idea away. It was too dangerous, too complicated. Too likely to be what Marco had known she would think.

Digging through the station directory, she took the better part of an hour to find the address, even knowing what she was looking for. She didn't know what Outer Fringe Exports did, except that they were shady enough that she hadn't wanted to work with them, and that they were competent enough that they'd known about the Martian claims disputing the salvage of the *Rocinante* before her crew had. Naomi found their physical address—a different berth than the one she'd been at the last time—and caught a cart.

The warehouses near the port were in a constant state of flux. The pressure of commerce and efficiency kept every space in use with as little

downtime between rental agreements, loading, and unloading as could be arranged. The sign on the tempered glass door read OUTER FRINGE EXPORTS, but in a week, a day, an hour, it could have been anything.

A young man at the counter smiled up at her. He had close-cropped hair and skin several shades darker than her own. The steel-rimmed glasses could have been an affectation or an interface device. She'd never seen him before.

"Hi," she said.

"Miss Nagata," the man said as if they were old acquaintances. "It's been some time. I'm sorry to say we don't have any work that would be suited to your ship at this time."

"Not what I'm here for," she said. "I need to charter a ship. And I need to do it very quietly."

The man's expression didn't change. "That can be an expensive problem."

"It needs to carry a crew no larger than twenty."

"How long would you need it?"

"I don't know."

"Would it be hauling cargo?"

"No."

The man's eyes lost their focus for a moment. The glasses were an interface, then. Naomi crossed her arms.

One in a hundred, she thought, I show up with my own warship ready to carry people off Ceres. One in twenty, I know how to find someone who will. She wondered what the one-in-five plan was. What was the sure thing.

The man's focus came back to her.

"I think we may be able to help," he said.

Chapter Fifteen: Alex

The ride to the hospital was a thing out of a nightmare. As the transport sped through the corridors, the painkillers started to take effect. The combination of ache and sharpness in his body shifted into a deep and troubling sense of simply being wrong. Once, when they were near the emergency admitting entrance, time stuttered as his consciousness slipped away and back again. None of the medics paid him much attention.

They were all focused on Bobbie.

The big woman's eyes were closed, and a pale plastic tube came out of her mouth, keeping her jaw open. From where he rode, Alex could make out only parts of her gurney's readout, and he wasn't sure how to interpret what he was seeing. The medics' voices were clipped and tense. Words and phrases like *attempting to reinflate* and *stabilizing* and *maintaining pressure* pushed Alex toward the edge of panic. Bobbie's body, what he could see of it, was limp. He told himself she wasn't dead. If she were dead, they wouldn't be trying to save her. He hoped that was true.

At the emergency ward, he found himself wheeled into an automated surgical bed not that different from the ones on the *Rocinante*. The scan probably took a minute and a half, but it seemed to go on forever. He kept turning to the side, looking for Bobbie, then remembering she was in a different room now. Even then he didn't understand how much his injuries and painkillers had compromised his mind until the police came and he tried to explain what had happened.

“So how did the woman with the power armor fit into it?” Bobbie asked.

She was sitting up in her hospital bed. Her gown was thick, disposable paper with Bhamini Pal Memorial Hospital printed on it like a pattern, dark blue over light. Her hair was pulled back into a loose bun, and deep bruises darkened her left cheek and her knuckles. When she shifted, the movement was careful. It was the way Alex moved after he'd worked out too hard and felt a little sore. He hadn't been shot twice—once through her left lung, once in her right leg—and he'd seriously considered taking a wheelchair to go between his room and hers.

"I meant you," Alex said. "I was having trouble coming up with your name."

Bobbie chuckled. "Yeah, they're going to want to talk to you again. I think the version they got was a little muddled."

"Do you think... Should we not be talking?"

"We're not under arrest," Bobbie said. "The only one of the other guys that's still breathing lawyered up before he got here. I'm pretty sure they're not going to be looking at us if they want to throw someone in jail."

"What did you tell them?" Alex asked.

"The truth. That a bunch of thugs broke into my rooms, tied me up, and started taking turns between kicking the shit out of me and asking why I was meeting with Alex Kamal."

Alex pressed his thumb against his upper lip until it ached a little. Bobbie's smile carried a load of sympathy.

"I don't know why that is," he said. "I don't have any enemies on Mars. That I know of."

Bobbie shook her head and Alex noticed again that she was a remarkably attractive woman. He coughed and mentally filed the thought under *horribly inappropriate given the circumstances*.

"My guess," Bobbie said, "is that it was less about who you are than who you're connected to."

"Holden?"

"And Fred Johnson. And maybe they can even put the two of us together with Avasarala. She shipped on the *Rocinante* for a while."

"For about a minute and a half, years ago."

"I remember. I was there," Bobbie said. "Still, one way or another, the most plausible scenario I've got is that they thought I was reporting something to you or you were reporting something to me. And, even better,

the idea scared them.”

“Don’t mean to look a gift horse in the mouth, but that definition of *even better* has got some mighty long teeth,” Alex said. “Did you tell them about your investigation?”

“No, I’m not ready to do that.”

“But you think this was related.”

“Oh, hell yes. Don’t you?”

“It’s what I’m hoping for, actually,” Alex said with a sigh. Across the hallway, someone shouted words Alex couldn’t make out. A nurse stalked by, scowling. “So what are we goin’ to do about it?”

“Only thing we can do,” Bobbie said. “Keep digging.”

“Fair enough. So. What exactly are we looking at?”

Bobbie’s expression sharpened. The problem, she said, was ships. The Martian Navy was the newest, best set of ships in the solar system. Earth had more ships, but her Navy was aging, with tech in them that was either generations old or retrofitted, shoehorning more recent designs into older frames. Both fleets had taken heavy losses in the last few years. Whether you called Avasarala’s influence prompting or putting her on a mission, Bobbie had started looking, and what she’d found was interesting.

The seven big *Donnager* -class ships were easy to keep track of, but the fleet of corvettes that they carried, ships like the *Rocinante*—they were slippery. Bobbie had started by going back to review the battle data from Io, from outside the Ring, from the incident in the slow zone. Really, when it came to damage reports, there was an embarrassment of riches.

At first, the numbers had seemed to match up. Half a dozen ships lost here, a handful there, the transponder codes decommissioned. But as she looked more deeply, she started running into discrepancies.

The *Tsuchi*, a corvette assigned to the *Bellaire*, had been decommissioned and scrapped after Io. A year later, it appeared in a small-group action report near Europa. The supply ship *Apalala* had been retired from service, and then seven months later, picked up a shipment headed to Ganymede. A load of medical supplies lost to accident appeared briefly on a loading schedule bound for Ceres and then disappeared again. Weapons lost in the fighting around what was now Medina Station appeared in an audit at Hecate Base once and not again.

Someone, Bobbie reasoned, had gone back through the records and

doctored the old reports, forging the deaths of ships and then erasing them from the later records, or trying to. She'd found half a dozen hiccups in the data, but any ships that had been successfully erased, she wouldn't see. That meant someone had to be involved high enough up the naval chain of command that they had access to the files.

There was protocol, of course, that laid out who was supposed to have access to the records, but she'd been in the process of looking into how that actually played out in practice when Alex had dropped her a line and suggested dinner.

"If you're up for it," Bobbie said, "that's what I'd want you to look at. Just who could have changed the information. Then I can start looking at them."

"Keep going down the road you were already on," Alex said.

"Only with maybe some friends in the Navy."

"That's one way we can go. It ain't the only one, though."

Bobbie sat forward, caught her breath, and leaned back. "What else are you thinking?"

"Someone hired the gentlemen who messed us up. Seems like findin' out what we can about them might also be worth our time."

Bobbie grinned. "That was the part I was planning to do."

"Well, all right, then," Alex said, and a man stepped into the doorway. He was huge. His shoulders brushed the doorframe on both sides, and his face was thick and heavy with a distress that could have been fear or anger. The bouquet of daffodils in his hand seemed tiny, and would until they were in a vase.

"Hey," he said. "I was just..."

"Come in," Bobbie said. "Alex, this is my brother Ben. Benji, this is Alex Kamal."

"Good to meet you," the massive man said, enfolding Alex's hand in his grip and shaking gently. "Thank you for everything you've done."

"Betcha?" Alex said.

The bed creaked as Bobbie's brother sat at its foot. He looked sheepishly at his sister. Now that she'd said the words, Alex could see the resemblance in them. Bobbie wore the look better.

"The doctor says you're doing well," Ben said. "David wanted me to tell you he's thinking of you."

“That’s sweet, but David doesn’t think about anything but terraforming and boobs,” Bobbie said.

“I’ve cleaned out the guest room,” Ben said. “When they release you from the hospital, you’re coming to stay with us.”

Bobbie’s smile grew sharper. “I don’t actually see that happening.”

“No,” her brother said. “No, this isn’t a discussion. I told you from the beginning that Innis Shallow was a dangerous place, especially for someone living by herself. If Alex hadn’t saved you—”

“Not sure I was actually saving anyone,” Alex said, but Ben scowled and kept right on going over the words.

“—you could have been killed. Or worse.”

“Worse than killed?” Bobbie said.

“You know what I mean.”

Bobbie leaned forward, resting her elbows on her knees. “Yes, I do, and I think that’s bullshit too. I am in no more danger in Innis Shallow than I would be up in Breach Candy.”

“How can you even say that?” her brother demanded, his jaw slipping forward. “After what you’ve just been through, it should be obvious that...”

Alex sidestepped toward the door. Bobbie caught his eye, and the brief smile, gone as soon as it was there, was eloquent. *I’m sorry* and *Thank you* and *We’ll talk about the important stuff when he’s gone*. Alex nodded and retreated to the hallway, the buzz-saw tones of siblings lecturing each other following after him.

When he got back to his recovery bed, the police were waiting, and this time he gave a statement that was, at least, coherent. Even if he left some of the background issues vague.

For the most part, family was a metaphor on long-haul ships. Now and then, there’d be a group that was actually related by blood, but that was almost always Belters. On military and corporate assignments, there might be a handful of married couples, and now and then someone would have a baby. People would wind up on the same ship who were cousins. They were the exception, and the rule was that family was a way of talking about need.

The need for friendship, the need for intimacy, the need for human contact that ran so deeply into the genome that anyone without it seemed not entirely human anymore. It was camaraderie writ large, a synonym for loyalty that was stronger than the concept it echoed.

Alex's experience of real family—of blood relations—was more like having a lot of people who had all wound up on the same mailing list without knowing quite why they signed up for it. He'd loved his parents when they were alive, and he still loved his memory of them. His cousins were always happy to see him, and he was glad of their welcome and their company. Seeing Bobbie and her brother together and feeling even in that brief moment the deep and unbridgeable mismatch of character between them drove something home to Alex.

A mother could love her daughter more than life itself the way the stories told, or she could hate the girl's guts. Or both. A sister and brother could get along or fight each other or pass by in a kind of uncomfortable indifference.

And if real relationship-by-blood shared descent could mean any of those things, maybe family was always a metaphor.

He was still thinking about it when he got to Min's hole. Her boys and the girl that she and her husband had adopted were all there, sharing a meal of fish and noodles when he arrived, and they all greeted him like they knew him, like his injuries were important to them, like they cared. He sat at the table for a little bit, making jokes and minimizing the assault and its aftermath, but what he wanted to do—what he did as soon as his sense of etiquette allowed—was excuse himself and head back to the guest room they'd set aside for him.

A message was waiting for him from the *Roci*. From Holden. Seeing the familiar blue eyes and tousled brown hair was weirdly displacing. Alex felt like part of him was already on the way back to the *Rocinante*, and he was a little surprised not to be there already.

"Alex. Hey, hope things are going well out there, and that Bobbie is good."

"Yeah," Alex said to the playback. "Funny you'd ask."

"So, I've been looking into this thing with missing ships? And there's a suspicious hit out at 434 Hungaria. Any chance you have access to a ship? If you need to rent one, feel free to pull the funds from my account. I'd like

you to go see if a ship named the *Pau Kant* is sitting out there parked and dark. Specs on the transponder code attached to this message.”

Alex paused the playback, the skin at the back of his neck tickling. Missing ships was turning into a motif to his day, and it made him uneasy. He played the rest of Holden’s message, rubbing his chin as he did it. There was a lot less to it than he wanted to know. The records on the *Pau Kant* didn’t show it as a Martian vessel, or anything else in particular. Alex set his hand terminal to record, saw what he looked like in the display, combed his fingers through his hair, and started the message.

“Hey, Captain. Got your thing about the *Pau Kant*. I was wondering if I could get a little more information about that. I’m sort of in the middle of somethin’ a mite odd myself.”

He described what had happened to him and Bobbie in lighter tones than he actually felt. He didn’t want to scare Holden when there was nothing the man could do to protect him or Bobbie. Apart from saying that the attackers seemed to have been spooked that Alex had appeared on the scene, he left out the details of Bobbie’s investigation and Avasarala’s. It might have been paranoia, but transmitting that information without another couple levels of encryption seemed like asking for trouble. He did ask what other ships were supposed to have gone missing, and how it might relate to Mars before he signed off.

Maybe whatever Holden was looking into was just coincidence. Maybe the *Pau Kant* and the missing Martian warships were totally unrelated. Wasn’t where Alex would put his money, though.

He checked to see if there was anything from Amos or Naomi, and felt a little let down when there wasn’t. He recorded brief messages for the both of them and sent them out.

In the main room of the apartment the kids’ voices were loud, three conversations going on at the same time, each fighting to be heard over the others. Alex ignored them, accessing the local directory and looking up old names. People he could think of from his time in the service. There were dozens. Marian Costlow. Hannu Metzinger. Aaron Hu. He checked the directory against them, old friends and acquaintances and enemies, looking for who was still on Mars, still in the Navy, still someone who might remember him well enough to go out for a few beers and talk.

By the end of the evening, he had three, and he sent messages to each of

them, then requested a connection to Bobbie. A few seconds later, she appeared on his screen. Wherever she was, it wasn't the hospital. She had on a shirt with a green collar instead of the blue patient's gown, and her hair had been washed and braided back.

"Alex," she said. "Sorry about my brother. He means well, but he's kind of a dick."

"Everybody's related to someone," he said. "You wind up at his place or your own?"

"Neither one," she said. "I need to hire a cleanup crew to get the blood off my floor, and I'm doing a solid security audit to figure out how they got in."

"Yeah. Wouldn't feel safe until that's done," Alex agreed.

"Right? And if there is a follow-up attack, I'm sure as hell not staying where it's going to catch Ben and his wife in the crossfire. I popped for a hotel room. They've got their own security, and I can pay for extra surveillance."

Min's voice rose in the background, calling for calm. There was laughter in her tones, and he heard it echoed in the protests of her children. A tightness like a hand closed over his heart. He hadn't thought about a follow-up attack. He should have.

"They got a spare room at that hotel?" he asked.

"Probably. You want me to find out?"

"Nah, I'll just pack up and head over, if that's all right. They don't, someone will." *And whoever it is, it won't be Min*, he thought but didn't say. "I got a few people I thought I'd try chatting up in the next few days. See if anything seems likely."

"I really appreciate this, Alex," Bobbie said. "We should talk about how to manage that safely. I don't want you walking into a trap."

"Wouldn't make me happy either. Also, you don't have access to a ship, do you?"

Bobbie blinked at the non sequitur. "What kind of ship?"

"Something small and fast," Alex said. "May need to get out to the Belt, take a gander at something for Holden."

"Well, actually, yeah," Bobbie said. "Avasarala gave me the old racing pinnace we took from Jules-Pierre Mao back in the day. It's pretty much just been sucking dock fees, but I could probably get it polished up."

“You’re kiddin’. She gave you the *Razorback*?”

“Not kidding. I think it was her way of paying me without actually paying me. She’d probably be confused that I haven’t sold it yet. Why? What’s up?”

“I’ll let you know when I hear more,” Alex said. “Maybe something, maybe nothing.”

But either way, he thought, it’ll get you and me both where it’s hard as hell to have someone make a follow-up attack.

Chapter Sixteen: Holden

The security footage from Tycho Station covered almost all of the public spaces. The wide, open common corridors, the thinner access ways. Gantries and maintenance corridors. It seemed like the only places the eyes of station security didn't reach were the businesses and personal quarters. Even the storage lockers and tool shops had cameras logging whoever went in or out. It should have made things easy. It didn't.

"This has got to be it," Holden said, tapping a finger against the screen. Under his nail, Monica's doorway opened. Two people came out. They wore light blue jumpsuits with no signs or insignia, dark, close-fitting caps, and work gloves. The crate they wheeled between them was the same formed plastic and ceramic that food and environmental services used to transport biological materials: raw fungal matter to be textured and flavored, then the foods that were made from them, and—when needed—the processed fecal remains taken back as substrate for the fungus. Magnetic clamps held it to the cart, and the indicator on the side showed it was sealed. It was big enough, maybe, to hold a woman. Or a woman's body.

They'd gone in an hour earlier. Monica had gone in twenty minutes before. Whatever happened, she had to have been in that box.

Fred, scowling and hunched over, marked the crate as an item of interest and put a follow order on it. Holden couldn't tell what the older man was thinking, but his eyes were flat with anger. Anger and something else.

"You recognize them?" Holden asked.

"They're not in the system."

"Then how did they get on the station?"

Fred glanced at him. "Working on that."

“Right. Sorry.”

On-screen, the two men—Holden was pretty sure they were both men—took the crate to a maintenance corridor, the trace clicking over from camera to camera automatically. In the narrower space, the crate bumped against the walls and tried to bind up where the corridor turned.

“Doors and corners,” Holden said.

“What?”

“Nothing.”

The security trace showed men and cart entering a warehouse. Pallets of similar crates filled the space. The men guided the cart to a half-filled one, unlocked the clamps, and hauled the crate up and onto the pallet with its siblings. Fred split the display, holding the trace on the cart, but adding one to each of the two men. One panel showed the storage space; the other followed the two figures out to the common corridors.

In the warehouse, a pair of mech drivers came, logged in from lunch, and resumed the task of piling on crates. In the common corridor, the two men went into a lavatory and didn’t come out. The trace on them flickered forward until the green border that marked a live feed framed the images. A short call to the warehouse manager verified that the two men hadn’t holed up there; they’d just disappeared. The cart, still going through the older records, was buried in among others just like it. Fred advanced the feed. Mech drivers came and went. Pallets filled and were piled on top of each other.

“Present status,” Fred said, and the security feed skipped forward without moving away from the warehouse camera. Whatever had been in the crate was still there.

“Well,” Fred said, rising to his feet, “this is about to turn into an unpleasant day. You coming?”

The environmental controls in the warehouse showed no anomalies, but Holden couldn’t help imagining he smelled something under the oil and ozone. A smell like death. The mech driver was a fresh-faced young woman with straight brown hair the same color as her skin. Her expression as she moved the crates back out from the pallet spoke of excitement and curiosity and barely constrained dread. With every crate that came off, Holden’s gut went tighter. Monica had told him that involving other people in his investigation was dangerous. He couldn’t help thinking that whatever they

found in the next few minutes was going to be his fault.

And so fixing it would be his responsibility. Assuming it could be fixed.

“That’s the one,” Fred said to the mech driver. “Put it over here.”

She maneuvered the container to the empty decking. Its magnetic clamps engaged with a deep thump. The indicator still showed that it was sealed. Even if Monica had been put into the thing alive, her air would have run out hours ago. The mech backed away, settling onto titanium and ceramic haunches. Fred stepped forward, lifted his hand terminal, and tapped in an override. The indicator on the crate shifted. Fred flipped open the lid.

The smell was rich and organic. Holden had a sudden powerful memory of being fourteen at his family compound on Earth. Mother Sophie had kept an herb garden by the kitchen, and when she’d turned the dirt before planting, it smelled just like this. The crate was filled to the brim with the soft, crumbling beige of raw fungal protein. Fred leaned forward, pressing his hand deep. Looking for a hidden body. When he pulled his arm back, dust clung to it up to the elbow. He shook his head no. It was an Earth gesture.

“Are you sure it’s the right crate?” Holden asked.

“I am,” Fred said. “But let’s check anyway.”

For the next hour, the increasingly confused mech driver hauled out crates from the pallet and Fred and Holden opened them. When the motes of protein dust in the air set off the particulate warning alarm twice, Fred called a stop.

“She’s not here,” he said.

“I saw that. So that’s kind of weird, right?”

“It is.”

Fred rubbed his eyes with his finger and thumb. He looked old. Tired. When he gathered himself, the sense of power and authority was still there. “Either they switched the crates somewhere between her quarters and here or they doctored the feed.”

“Both of those would be bad.”

Fred looked over at the mech driver as she piled the opened crates into a stack to ship back for reprocessing. When he spoke, his voice was low enough it would only carry to Holden. “Both of which would mean they had a high-level working knowledge of the security system, but not enough

access to wipe the records completely.”

“That narrows it down?”

“A little, maybe. Could be a UN black ops team. They could have done something like this. Or Mars.”

“But you don’t think that’s it, do you?”

Fred chewed his lip. He pulled up his hand terminal, typed in a series of codes, every tap sharp and percussive. An alert Klaxon sounded and gold-and-green alert icons appeared on every display from Holden’s hand terminal to the door controls to the mech status panel. Fred pushed his fists into his pockets with a satisfied grunt.

“Did you just lock down the *station*?” Holden said.

“I did,” Fred said. “And I’m keeping it locked down until I’ve got some answers. And Monica Stuart back.”

“Good,” Holden said. “Extreme, but good.”

“I may be a little pissed off.”

The contents of Monica’s quarters were laid out on the gray-green ceramic counters of the security lab. No blood, no images, and the background soup of DNA from thousands of people who’d been in contact with the objects in the last week, usually with too small a sample to identify an individual. This was what was left. A clothing bag, its zipper ripped and hanging open in a mindless smile. A shirt Holden remembered her wearing when he’d seen her a few days before. Her crippled hand terminal with its shattered display. All the things that hadn’t belonged to the station when it rented her the space. It seemed small, like there wasn’t enough there. He realized it was just that he was thinking of it as the collection of a lifetime. Probably she had other possessions somewhere else, but maybe she didn’t. If they didn’t find her alive, maybe this was all she’d have to leave behind.

“You cannot be fucking serious,” Sakai said for what seemed like the third or fourth time. The chief engineer’s face was red, his jaw set. He’d arrived at the security station a few minutes after Fred and Holden, and Holden was a little surprised Fred hadn’t had him thrown out yet. “I have eight ships inbound within the next week. What am I supposed to do? Tell

them to match orbit and float until we decide whether we'll let them in?"

"Seems like a good start," Fred said.

"We have supplies due to ship on half a dozen contracts."

"I'm aware of that, Mister Sakai." Fred's voice was no louder; there was no anger in it. The cool politeness made the hair on the back of Holden's neck rise. Sakai seemed to feel it too. It didn't stop him, but his voice went from accusatory to almost wheedling.

"I've got shipments on two dozen jobs due to go *out*. There are a lot of people counting on us."

For a moment, Fred's shoulders seemed to sag, but his voice was just as strong. "I'm aware of that. We'll open up for business again as soon as we can."

Sakai wavered, on the edge of saying something more. Instead, he made a short, impatient sigh and walked back out as the head of security came in. She was a thin-faced woman Fred called Drummer, but Holden didn't know if that was her first name, her last, or just something she went by.

"How's it going?" Fred asked.

"Nothing we can't handle," she said. Her voice had a crisp accent that Holden couldn't place. She glanced at him, nodded curtly, and turned back to Fred. "Do we have any information we can give on how long we expect the lockdown to be in effect?"

"Tell them the interruption of service will be as brief as possible."

"Yes, sir. Thank you, sir," Drummer said, then turned away.

"Drummer. Close the door when you go, eh?"

Her eyes flickered, cut back to Holden, then away again. She didn't say anything, but she pulled the door closed behind her when she left. Fred gave Holden a mirthless, tired smile.

"Sakai's right. I just shut down the equivalent of a major port city because of one missing woman. Every hour I keep it like this, Tycho's losing thousands of credits in a dozen different scrips."

"So we'll have to find her quickly."

"If they haven't already fed her into the recyclers and broken her down to water and a few active molecules," Fred said. And then a moment later, "I have the sensor arrays sweeping the local area. If she's been spaced, we'll know it soon."

"Thank you," Holden said, leaning against the counter. "I know I don't

say it often, but I do appreciate this.”

Fred nodded to the door. “You see her? Drummer?”

“Sure.”

“I’ve been working with her directly for three years. Knew who she was for ten before that.”

“All right,” Holden said.

“If you’d asked me yesterday, I’d have told you I trusted her with my life.”

“Now?”

“Now there is exactly one person on this station who I’m certain isn’t going to shoot me in the back of the head if I keep pressing on this, and that’s you,” Fred said.

“That’s got to be uncomfortable.”

“It really is. So what I mean to say, James, is that while I am glad that you appreciate all I’m doing for you, I’m also taking you on right now as my personal bodyguard. In return, I’ll try to keep anyone from shooting you.”

Holden nodded slowly. Something in the back of his brain was shifting, like a thought that wasn’t quite formed. A wave of vertigo washed over him like he was looking over a cliff. “Two of us against a deep OPA conspiracy.”

“Until I have evidence to the contrary, yes.”

“That really is an uncomfortable position to be in, isn’t it?”

“Not what I would have picked, no,” Fred said. “But someone knows how to circumvent my security systems, and whatever your reporter friend was doing was enough to spook them into action direct enough to tip their hand.”

“The missing ships,” Holden said. “There were a couple of people I mentioned it to.”

“That’s not something you do.”

“In retrospect, I wish I’d played it a little closer to the vest, but—”

“Not that,” Fred said. “When you’ve infiltrated the enemy security structures, you don’t do anything that shows that you’ve managed it. It’s basic information warfare. As long as the enemy doesn’t know they’re compromised, you can keep gathering intelligence. That’s not something you give up unless the stakes are unimaginably high or...”

“Or?”

“Or the enemy you’ve compromised isn’t going to be around very long anyway. I don’t know if those missing ships spooked someone into making a stupid mistake, or if my position on Tycho is so precarious that it doesn’t matter anymore whether I know.”

“You seem to be taking it all in stride.”

Fred hoisted an eyebrow. “I’m panicking on the inside,” he said in a deadpan.

Holden looked over the pile of Monica’s belongings as if they might have something to add to the conversation. The hand terminal blinked forlornly. The blouse hung loose and sad.

“Did you pull anything from her terminal?” he asked.

“We can’t connect to it,” Fred said. “All the diagnostics are disabled or sunk in third-party encryption. Journalists.”

Holden picked up the hand terminal. The shattered display was a mess of light scatter. The only sections that still had anything close to recognizable were a blinking red button in one corner and a few letters in a particularly large shard: NG SIG. Holden tapped the red button and the hand terminal flashed once. The button was gone, the letters replaced by something pale brown with a line across it, a single jigsaw puzzle piece floating in a sea of noise-light.

“What did you do?” Fred asked.

“There was a button,” Holden said. “I pushed it.”

“Jesus Christ. That really is how you go through life, isn’t it?”

“But look. It... I think I may have accepted an incoming signal.”

“From what?”

Holden shook his head. Then turned back to the pile of Monica’s belongings, the tiny half-thought that had been bothering him slipping into his consciousness with something like relief.

“Her video capture,” he said. “She has a little wearable interview rig. It’s intentionally unobtrusive so that the person she’s talking to sort of forgets they’re on camera.”

“And?”

Holden spread his hands. “It’s not here.”

Fred moved forward, his lips thin, his eyes shifting over the mess of

light from the broken screen. Holden had a sense of movement, as if the image was shifting slightly. Voices came from the far side of Fred's office door. A man's voice raised in anger; Drummer's calm, clipped reply.

"Are you sure we can't get into this hand terminal?" Holden said.

"Positive," Fred said, "but there may be another way. Come on. If we're going to solve this, we're going to need an imaging astronomer."

Once Fred explained the problem, it took three hours to set up a rig that would capture the glow coming from the scattered screen and an hour more to get the computer to understand its new task. The properties of light coming off extrasolar dust clouds were apparently very different from a busted terminal display. Once the expert systems were convinced that the problem fit inside their job description, the lab went to work matching polarizations and angles, mapping the fissures in the surface of the display, and building a computational lens that couldn't exist in the physical world.

Fred had emptied the lab and sealed it. Holden sat on a chair, listening to the tick-tick-tick of the scanners recording photons and watching the image on the display slowly cohere. Fred hummed to himself, a low, slow tune that seemed melancholy and threatening at the same time. The empty stations and desks highlighted how alone the two of them were in a station filled with people.

A computational run ended. The image updated. It was still rough. Rainbow-colored deformations crossed it and sections were simply missing; it looked like the beginning of a migraine.

But it was enough. Several empty meters, ending in a square metal door complicated by an industrial bolt mechanism. Walls, ceiling, and floor marked with scuffed yellow paint and stippled by guide holes where pallets and crates would stack.

"That's a storage container," Fred said. "She's in a shipping container."

"The way the image moves. Is that her? Is she moving?"

Fred shrugged.

"Because if she's moving, then she's probably alive, right?"

"Could be. If she's alive, it's because they want her alive. And off

Tycho. Look at that.”

Holden followed Fred’s finger. “It’s the edge of the doorway?”

“The door’s sealed. You don’t do that until it’s ready to ship. There are probably a quarter million containers like that on the station, but I’d bet we don’t have more than a few thousand sealed and ready to go out. Whoever wants her, they want her someplace we can’t get her back from.”

Holden felt something in his gut relax. She was out there, and she was okay. Not safe, not yet. But not dead. He hadn’t realized how much the guilt and fear had settled down on his shoulders until the moment of hope lifted it.

“What?” Fred said.

“I didn’t say anything.”

“But you made that noise.”

“Oh,” Holden said. “Yeah, I was just noticing how having everyone I care about gone makes it really important that I not screw up the things I can control.”

“Good insight. Well done.”

“Are you making fun of me?”

“Little bit. But I’m also running a targeted security scan of the shipping containers on the float. And guess what?” Fred gestured to the display on the desk before him. The great emptiness of the Tycho work sphere was drawn in thin, clean schematic lines. From habit, Holden’s gaze went to the *Rocinante*. Fred pointed beyond it to a floating cluster of metal containers. “One of them’s warm.”

Chapter Seventeen: Alex

Alex had spent a fair amount of his training time at Hecate Base, and going back now was strange in a couple ways. There were the sorts of changes that he'd become accustomed to on Mars—old bars gone, new restaurants in place, the crappy handball courts converted to an administrative center, things like that. But driving his cart through the wide corridors, the thing that struck him most was how young everyone was. Cadets strutted in front of the bar that had once been the Steel Cactus Mexican Grill and sold to-go cups of Thai food now, their chins up and their chests out looking like they were playing dress-up. The ads on the screens were all for weapons and churches, singles services designed for people on tours of duty, and life insurance tailored for the families they left behind. They were the sorts of things that promised control or comfort in an uncertain universe. Alex remembered ads like that from decades before. The styles had changed, but the needs and subterranean fears that fueled them were the same.

Alex had worn the uniform, told the jokes. Or at least the same kind. He'd wondered whether there would be violence when he got out with a mixture of hope and dread. He'd pretended to be tougher than he was in hope of becoming tougher. He remembered how serious it had all been. The time Preston had gotten drunk and started a fight with Gregory. Alex had been pulled into it, and they'd all ended up before the MPs, certain their careers were over. The time Andrea Howard got busted cheating and had been dishonorably discharged. It had felt like someone died.

Now, looking at these kids, of course there was brawling and stupid decisions. They were children. And so he'd been a child when he was there too, and his choices had been made by a guy who didn't know any better.

He'd married Talissa when he was about that old. They'd made their blueprints for how he'd serve his tours and then come home. All their plans had been made by kids this young. Looked at that way, it made sense how nothing had worked out.

The other thing that surprised him was that *everyone* seemed to know who he was.

He parked his cart outside a teahouse called Poush that had survived the years since he'd served. The blue-and-gold awning put a gentle shadow over the glassed doorway. Faux-aged paint on the window curved in art nouveau framing with phrases in French. Alex figured the intention was to evoke the idea of some Parisian café of centuries before for people who'd never so much as stepped on the same planet as France. It was strange that the quaint feeling translated so well.

Inside, a dozen small tables with real linen cloth crowded together. The air was thick with the scent of the local qahwa—almonds and cinnamon and sugar. Captain Holden had a thing for coffee, and Alex felt a moment's regret that he was off on Tycho Station where he couldn't smell this. Before he could finish the thought, Fermín boiled up out of his chair and wrapped his arms around him.

"Alex!" Fermín shouted. "Good God, man. You got fat."

"No," Alex said, returning the hug and then breaking it. "That was you."

"Ah," his old friend said, nodding. "Yes, that was me. I forgot. Sit down."

The waiter, a young man of maybe eighteen, looked out from behind the kitchen door and his eyes widened. The smile pretended to be the customary politeness, but when he ducked back Alex could hear him talking to someone. He sounded excited. Alex tried not to feel awkward about that.

"Thanks for this," Alex said. "I don't like to be the guy who doesn't keep in touch until he needs a favor."

"And yet," Fermín said. The years had turned his stubble gray and thickened his jowls. Alex felt like if he squinted, he could still see the sharp-faced man he'd served with hidden somewhere in him. It was easier to see him in his gestures when he waved Alex's concern away. "It's nothing. Happy to do a favor for a friend."

The waiter came out of the kitchen, nodding. The wide-mouthed cup in

his hand steamed. He put it in front of Alex almost shyly.

“Specialty of the house,” the boy said. “For you, Mr. Kamal.”

“Ah,” Alex said. “Thank you.”

The boy nodded again and retreated. Alex chuckled uncomfortably at the cup, and Fermín grinned. “Come on now. You’ve got to be used to this kind of thing, right? You’re Alex Kamal. First pilot through the Ring.”

“Naw, just the first one that lived.”

“Same thing.”

“And I surely didn’t want to be,” Alex said. “They were shooting at me.”

“And that makes it less romantic?”

Alex blew across the surface of the cup and sipped at it. Chai with honey and cardamom and something else he couldn’t quite place. “That trip was a lot of things,” he drawled. “Romantic wasn’t one of ’em. And usually since then I’ve had the captain around to soak up the attention.”

“Probably different elsewhere. But you’re a local boy. One of us who got out and made good.”

“Is that what happened?”

Fermín spread his hands, the gesture taking in the teahouse, the corridor outside, Hecate Base, and Mars. “I’ve been here the whole damned time. Made it as far as chief petty officer. Two divorces and a kid in upper university calls me twice a year to borrow money.”

“Bet you had fewer people shooting at you, though. It’s not as much fun as you make it sound.”

“Suppose not,” Fermín said. “Grass is always greener.”

For an hour, more or less, they sat drinking chai and eating almond cookies—though fewer of those than they had when they’d been younger. Fermín brought him up to speed on half a dozen of the others that they’d known in common back in the day. The chai was good and Fermín jovial. It was hard to say what it was exactly that left Alex melancholy. When the time came to leave, the boy wouldn’t take their money. He just said “On the house” when they tried.

The checkpoint into the base proper was manned by a security team that had Fermín glance into a facial recognition setup. Once he cleared, they checked Alex for weapons and contraband and issued him a visitor pass. The process was less than five minutes, and leisurely at that. Alex followed

Fermín to a moving walkway and leaned against the rail with him as it drew them forward, deeper into Olympus Mons.

“So this guy,” Alex said.

“Commander Duarte? You’ll like him. Everyone likes him. Admiral Long’s aide. Has been for the last ten years.”

“Long hasn’t retired?”

“She’ll die at her desk,” Fermín said. He sounded just on the edge of resentful, but his smile covered whatever it was over.

“I appreciate you setting this up.”

“Not a problem. Duarte was excited to meet you.”

“Really?”

“Why the surprise? You’re pilot of the *Rocinante*. You’re famous.”

Winston Duarte’s office was plain and comfortable. The desk was simple pressed polycarbonate, a little larger maybe than the receptionist’s in the lobby. The screen on the wall was set to a calm semi-abstract piece that flowed in sepia and brown, evoking fallen leaves and mathematical proofs in roughly equal proportions. The only touch of luxury was a shelf of what appeared to be actual printed books on military strategy. The man himself fit in the space like he’d been designed for it. Half a head shorter than Alex with acne-pocked cheeks and warm brown eyes, Duarte radiated politeness and competence. After they shook hands, he took the seat beside Alex rather than cross back behind his desk.

“I have to say I’m a little surprised at the visit,” Duarte said. “Most of my dealings with the OPA are formal.”

“The *Roci*’s not OPA.”

Duarte’s eyebrows ticked up a millimeter. “Really?”

“We’re more of an independent contractor. We’ve taken jobs from the OPA, but Earth’s paid some of our bills. Private companies too, if the job’s a good fit.”

“I stand corrected. All the same, I’m honored. What can I do for you, Mr. Kamal?”

“Call me Alex for one thing. I’m not here officially. I mean, I’m on

leave from the ship. Came back to the old stompin' grounds for a visit, came across an old friend who needed a hand with something, and one thing led to another."

"Which led you to me," Duarte said. His smile was sudden and warm. "I'll count myself lucky for that. What's on your friend's mind?"

"Missing ships."

Duarte went still, his smile still perfectly in place. For a moment, it was like the man had become a statue. When he moved again, he sat back, leaning into the chair with a barely exaggerated casualness that plucked at Alex's ears. "I'm not aware of any ships that have gone missing. Is there something I should know about?"

Alex folded his hands on his knee. "My friend. She's a marine. Well, ex now. She's been doing a little digging into the black market."

"A journalist, then?"

"A patriotic Martian," Alex said. "She's not looking to stir up anything, and neither am I. But she's found some things that got her back up."

"Things like what?"

Alex lifted a finger. "I'll get there in a minute. Thing is, she's not Navy. Doesn't have friends and contacts on our side. So she asked if I'd ask, and when I did—"

"Chief Petty Officer Beltran sent you to me," Duarte said. "I see."

"Did he make a mistake?"

Duarte was quiet for a long moment, his eyes soft and fixed on nothing. Alex shifted in his seat. These sorts of conversations weren't part of his usual duties, and he couldn't tell if it was going well or poorly. Duarte sighed. "No. He didn't."

"You're... you're seeing things too. Aren't you?"

Duarte stood and moved to the door, not touching it, but looking. His head bent a degree. "This isn't the sort of thing we talk about. I don't break the chain of command."

"I respect that," Alex said. "I'm not asking you to be disloyal to anyone. Only I have some information, you maybe have some too. I'll tell you what I'm comfortable sharing, you do the same. Maybe we can do each other some good."

"I have an investigation in progress."

"Anything I give you, I don't mind your passing on," Alex said. "And

maybe it'd be best if it was like that for you too."

Duarte considered, his lips pressing together. "All right. What have you got?"

"Blips in the inventories. Things that got lost or destroyed that showed up again later. Weapons. Medical supplies."

"Ships?"

"Yeah," Alex said. "Ships."

"Give me a name."

"*Apalala*."

Duarte seemed to deflate. He went to his desk and sank into the chair behind it, but when he spoke, his voice had a relaxed tone that made Alex feel like he'd passed a test. Like the false and cordial ease that had begun the meeting had fallen away like a mask.

"That's one I've been looking at too," Duarte said.

"What are you seeing?"

"I don't know. Not exactly. We're stretched thin. You know that?"

"People heading out for the new planets."

"Inventories are running slow. I think more of them are being dry-labbed than anyone wants to admit. I've been trying to convince the admiral that it's a problem, but either she doesn't understand or..."

"Or?"

Duarte didn't finish his thought. "There has been a pattern of attacks too. They may be political or it may just be theft and piracy. You heard about the attack on Callisto?"

"Heard about it."

"Have you come across anything about it particularly?"

"No."

Duarte clenched his jaw in disappointment. "There was something about that one that bothers me, but I can't put my finger on it. The timing was precise. The attack was well coordinated. And for what? To loot a shipyard?"

"What did they take?"

Duarte's gaze clicked onto Alex. His smile was sorrowful. "I don't know. Nobody knows. I think nobody will ever know, because I can't even figure out what was there. That's how bad it is."

Alex scowled. "You're telling me that the Martian Navy doesn't know

where its own ships are?”

“I’m telling you that the tracking of supplies, ships, and material has all but collapsed. We don’t know what’s missing because *we don’t know*. And I’m telling you that the leadership is so focused on trying not to lose face in front of Earth and the OPA that they’re downplaying it.”

“Covering it up.”

“Downplaying it,” Duarte said. “Prime Minister Smith is making a big show *right now* of taking a convoy to Luna to meet with the UN secretary-general and swearing that everything’s fine, and he’s doing that because it isn’t true. If I were a criminal and a black marketer, all this would look like a permanent Christmas.”

Alex said something obscene. Duarte opened his desk and took out a pad of paper and a silver pen. He wrote for a moment, then tore off the sheet and handed it across the desk. In precise, legible handwriting he’d written KAARLO HENDERSON-CHARLES and an address in base housing. The act of physically writing something down, not trusting the information to electronic transfer, felt like either sensible precaution or paranoia. Alex wasn’t sure which.

“While you’re here, I’d recommend talking to Kaarlo. He’s a senior programmer that’s been working on a project that was supposed to coordinate the databases. He was the one who came to me first to say he was seeing problems. If you have specific questions, he may be able to give you answers. Or he may be able to point you to where they are.”

“Will he help me?”

“He may,” Duarte said. “I did.”

“Could you... give him cover?”

“No,” Duarte said, with his sad smile. “I’m not ordering anyone to do anything with you. No offense. You’re not Navy anymore. Whatever we do, you and I, we do as part of my investigation. And I report all of it, down to the letter, to the admiral.”

“Covering your ass.”

“Hell yes,” Duarte said. “You should do the same.”

“Yes, sir,” Alex said.

Fermín wasn’t in the waiting area when he left, so Alex went out and caught one of the moving walkways heading east, toward base housing. His

head felt a little light, like he'd been running the oxygen too lean for too long.

The Navy had always been the thing in his life that didn't change. The permanent factor. His relationship to it might shift. He did his tours, he mustered out, but those changes were all about him. His life, his fragility and mortality and impermanence. The idea that the Navy itself could be fragile, that the government of Mars might stumble or collapse, was like saying the sun might go out. If that wasn't solid, then nothing was.

So maybe nothing was.

Kaarlo Henderson-Charles' hole was in a stretch of a hundred just like it, spare and spartan. There was nothing on the gray-green door to identify it beyond numbers. No flowers in the planter, only dry soil. Alex rang the bell. When he knocked, the door opened under his knuckles. He heard someone grumbling angrily under their breath. No. Not a person. The recyclers on high, scrubbing the air. He caught a whiff of cordite and something like rotten meat.

The body was on the kitchen table in its uniform jumper. The blood had pooled under the chair and splattered along the wall and ceiling. A pistol still hung in the limp right hand. Alex coughed out a laugh of mixed disbelief and despair, then he pulled out his hand terminal and called the MPs.

"Then what happened?" Bobbie asked.

"What do you think? The MPs came."

The hotel lobby was decorated in crimson and gold. A wall fountain burbled and chuckled beside the couches, giving the two of them something like privacy. Alex sipped at his gin and tonic. The alcohol bit a little. Bobbie pressed her knuckles against her lips and scowled. She was looking solid for any other person who'd been tortured and shot, but still a little fragile for Bobbie. The bandages that covered bullet wounds on her left side made an awkward bump under her blouse, but nothing more.

"They questioned you?" she said, barely even making it a question.

"For about eight hours. Duarte was able to give me a solid alibi, though,

so I'm not in prison."

"Small favors. And your friend? Fermín?"

"Apparently his terminal's not on the network. I don't know if he killed the guy or if whoever killed the guy killed him or... anything. I don't know anything." He drank again, more deeply this time. "I may not be good at this whole investigation thing."

"I'm not much better," Bobbie said. "Mostly I've just been shaking the trees and seeing what falls out. So far the only thing I'm really sure about is that something's going on."

"And that people are willing to kill each other over it," Alex said.

"And now that the MPs are involved, they're going to lock down the investigation like it was fissionable. I'm not going to be able to do a damned thing."

"Amateur detective hour does seem to be pretty much over," Alex agreed. "I mean, I can still ask around."

"You did more than enough," Bobbie said. "I shouldn't have gotten you into this in the first place. I just don't like disappointing the old lady."

"I can respect that. But I do kind of wish I knew what was going on."

"Me too."

Alex finished his drink, the ice clicking against his teeth. He had a pleasant warmth in his belly. He looked at Bobbie, saw her looking back at him.

"You know," he said slowly, "just because everything's shut down here, it doesn't mean everything's shut down everywhere."

Bobbie blinked. Her shrug was noncommittal, but there was a gleam in her eyes. "You're thinking about that backwater asteroid Holden was asking about?"

"You've got a ship. There's nothing we can do here," Alex said. "Seems like something we could do."

"Anyone shot at us, at least we'd see it coming," Bobbie said, her nonchalance radiating a kind of excitement. Or perhaps it was the alcohol and the prospect of being in a pilot's chair again making Alex see what he wanted to see.

"We could go," he said. "Take a look. Probably it's nothing."

Chapter Eighteen: Holden

The construction sphere of Tycho Station glittered around Holden, brighter than stars. Ships hung in their berths in all states of undress, the *Rocinante* just one among many. Other ships hung in the center, awaiting clearance to leave. The sparks of welding rigs and the white plumes of maneuvering thrusters blinked into and out of existence like fireflies. The only sound he heard was his own breath, the only smell the too-clean scent of bottled air. The dirty green-gray EVA suit had TYCHO SECURITY stenciled on the arm in orange, and the rifle in his hand had come from Fred's weapons locker.

Station security was on high alert, Drummer and her teams all set to watch each other on the assumption—and Holden was too painfully aware that it wasn't anything more—that if there was a dissident faction within them, they'd be outnumbered by the ones loyal to Fred. When they'd started out from the airlock, Holden had turned on the security system. It highlighted slightly over a thousand possible sniper's nests. He'd turned it off again.

Fred floated ahead of him strapped into a bright yellow salvage mech. The rescue-and-recovery kit looked like a massive backpack slung across the mech's shoulders. A burst of white gas came from the mech's left side, and Fred drifted elegantly to the right. For a moment, Holden's brain interpreted the dozens of shipping containers clustered in the empty space outside the massive warehouse bays as being below them, as if he and Fred were divers in a vast airless sea; then they flipped and he was rising up toward them feetfirst. He turned the HUD back on, resetting its display priorities, and one container took on a green overlay. The target. Monica Stuart's prison, or else her tomb.

"How're you doing back there?" Fred asked in his ear.

“I’m solid,” Holden said, then curled his lip in annoyance and turned his mic on. “I’m solid except that this isn’t my usual suit of armor. The controls on this thing are all just a little bit wrong.”

“Keep you from dying if they start shooting at us.”

“Sure, unless they’re good at it.”

“We can hope they’re bad,” Fred said. “Get ready. I’m heading in.”

As soon as they’d identified the container, Holden had thought they’d send out a mech, haul it into a bay, and open it. He hadn’t thought about the possibility of booby traps until Fred pointed it out. The container’s data showed awaiting pickup, but the frame that should have said what ship it was slated for was garbled. The image from Monica’s feed didn’t show anything beyond the access door. For all they knew, she could be sitting on tanks of acetylene and oxygen wired to the same circuit as the docking clamps. What they knew for certain was that the main doors were bolted and sealed. But even those could be wired to a trigger. The lowest-risk option, according to Fred, was to cut a hole into the visible doorframe and send someone in to take a look. And the only someone he was sure he could trust was Holden.

Fred positioned himself in front of the container’s doors, and the mech’s massive arm reached back and plucked the r-and-r pack loose. Fred unpacked it with a speed and efficiency of movement that made it seem like something he did all the time. The thin plastic emergency airlock, a single-use cutting torch, two emergency pressure suits, a distress beacon, and a small, sealed crate of medical supplies all took their places in the vacuum around him like they’d been hooked in place. Holden had spent enough years bucking ice to admire how little drift each piece of equipment had.

“Wish me luck,” Fred said.

“Don’t blow up,” Holden replied. Fred’s mic cut out on his chuckle, and the mech’s arms swung into motion with a surgical speed and precision. The welding torch bloomed, slicing through the metal while a sealant foam injector followed to keep the air in the box from venting. Holden opened a connection to the lab and the captured image from Monica’s feed. A brightness like a star shone there.

“We’ve got confirmation,” Holden said. “This is the right one.”

“I saw,” Fred replied, finishing the cut. He smoothed the airlock over the scar, pressing the adhesive against the surface, and then opened the outer

zipper. “You’re up.”

Holden moved forward. Fred held out a bulky three-fingered mech claw, and Holden gave it the rifle, scooping up the medical bag and emergency suit.

“If anything looks suspicious, just get back out,” Fred said. “We’ll take our chances with a real demolitions tech.”

“I’ll just pop my head in,” Holden said.

“Sure you will,” Fred said. The angle of the faceplate made Fred’s smile impossible to see, but he could hear it. Holden pulled the outer sheet of the lock over him, sealed it, inflated the blister, and opened the interior sheet. The cut was a square, a meter to each side, black scorch marks with a pale beige foam between them. Holden put a foot on the uncut container door, locking the mag boot in place, and kicked in. The foam splintered and broke inward; the cut panel floated into the container. Dull buttery light spilled out.

Monica Stuart lay strapped in a crash couch. Her eyes were open but glazed, her mouth slack. A cut across her cheek had a ridge of black scab. A cheap autodoc was clamped to the wall, a tube reaching out to her neck like a leash. There didn’t seem to be anything else there. Nothing with a big CAUTION EXPLOSIVES sign anyway.

When Holden grabbed the edge of the crash couch, it shifted on its gimbals. Her eyes looked into his, and he thought he saw a flicker of emotion there—confusion and maybe relief. He took the needle out of her neck gently. A tiny spurt of clear liquid bubbling and dancing in the air. He cracked the emergency medical kit open and strapped it over her arm. Forty long seconds later, it reported that she appeared sedated but stable and asked if Holden wanted to intervene.

“How’s it going in there?” Fred asked, and this time Holden remembered to turn on the mic.

“I’ve got her.”

Three hours later, they were in the medical bay on Tycho Station proper. The room was sealed off, four guards posted outside and all network

connections to the suite physically disabled. Three other beds sat empty, the patients, if there were any, rerouted to other places. It was half recovery room, half protective custody, and Holden could only wonder if Monica understood how much of that security was just theater.

“That wasn’t fun,” Monica said.

“I know,” Holden said. “You’ve been through a lot.”

“I have.” The words were slushy, like she was drunk, but her eyes had the sharpness and focus Holden was used to seeing in them.

Fred, standing at the foot of the bed, crossed his arms. “I’m sorry, Monica, but I’m going to have to ask you some questions.”

Her smile reached her eyes. “Usually goes the other way.”

“Yes, but I usually don’t answer. I’m hoping you will.”

She took a deep breath. “Okay. What do you have?”

“Why don’t we start with how you wound up in that container,” Fred said.

Her shrug looked sore and painful. “Not much to tell there. I was in my quarters and the door opened. Two guys came in. I sent an emergency alert to security, screamed a lot, and tried to get away from them. But then they sprayed something in my face and I blacked out.”

“The door opened,” Fred said. “You didn’t answer it?”

“No.”

Fred’s expression didn’t change, but Holden had the sense of growing weight in the angle of his shoulders. “Go on.”

“I came to when they were loading me into the crash couch. I couldn’t move much,” Monica went on, “but I managed to turn my camera rig on.”

“Did you hear anyone speaking?”

“Did,” she said. “They were Belters. That’s what you’re getting at, isn’t it?”

“It’s one thing. Can you tell me what they said?”

“They called me some unpleasant names,” Monica said. “There was something about a trigger. I couldn’t follow all of it.”

“Belter creole can be hard to follow.”

“And I’d been drugged and assaulted,” Monica said, her voice growing hard. Fred lifted his hands, placating.

“No offense meant,” he said. “Do you remember anything specific that —”

“This is about the missing colony ships, isn’t it?”

“It’s early to say what this is ‘about,’ ” Fred said, and then, grudgingly, “but that’s certainly one possibility.”

“The OPA’s doing it, then. Only you didn’t know about it.”

“I’m not confirming or denying anything, just at the moment.”

“Then neither am I,” Monica said, crossing her arms.

“Hey, hey, hey,” Holden said. “Come on, you two. We’re all on the same side here, right?”

“Not without terms,” Monica said.

Fred’s jaw went tight. “We just saved your life.”

“Thanks for that,” Monica said. “I’m included in the investigation. All of it. Exclusive interviews with both of you. I’ll give you everything I have about the colony ships and my abduction. Even the parts I didn’t tell Holden. And fair warning before I go public with any of this.”

“Wait a minute,” Holden said. “There were parts you didn’t tell me?”

“Final approval before anything sees air,” Fred said.

“Not a chance,” Monica said. “And you need me.”

“Final approval exclusively for issues of security and safety,” Fred said. “And two weeks lead time.”

Monica’s eyes were bright and hungry. Holden had traveled with her for weeks going out to the Ring the first time, and he felt like he knew her. The ruthlessness in her expression was surprising. Fred only seemed amused by it.

“One week lead time, and nothing unreasonably withheld,” she said and pointed an accusing finger at Fred. “I’m trusting you on that.”

Fred looked to Holden, his smile thin and unamused. “Well, now I’ve got two people I know aren’t working for the other side.”

The thing Holden hadn’t known—No, that wasn’t true. The thing Holden had known, but hadn’t appreciated, was the number of ships moving through the rings and out to the vast spread of new planets. Monica’s full logs tracked the almost five hundred ships that had made the transit. Many were smaller even than the *Rocinante*, traveling together in groups to make

a claim on a new and unknown world or else to join newly founded steadings on places with names like Paris and New Mars and Firdaws. Other ships were larger—true colony ships loaded with the same kinds of supplies that, generations before, humanity had taken out to Luna, Mars, and the Jovian moons.

The first one to vanish had been the *Sigyn*. She'd been a converted water hauler a little newer than the *Canterbury*. Then the *Highland Swing*, a tiny rock hopper that had been nearly gutted to put in an Epstein drive with three times the power a ship like that could ever have used. The *Rabia Balkhi* that she'd shown him had the best footage of its transit, but it wasn't the first or the last to disappear. As he went through, he made note of the types and profiles of all the missing ships to forward on to Alex. The *Pau Kant* could be any of them.

There was another pattern to the vanishing too. The ships that went missing did so during times of high traffic when Medina Station's attention was stretched between five or six different ships. And afterward—this was interesting—the ring through which the missing ship had passed showed not a spike in radiation but a discontinuity—a moment when the background levels changed suddenly. It wasn't something that other transits seemed to have. Monica had interpreted it as evidence of alien technology doing something inscrutable and eerie. Knowing what they did now, it looked to Holden more like a glitch left over where the data had been doctored. Like switching the crate that Monica had been taken away in or vanishing into a men's room and never coming out, someone would have had to hide the “missing” ships coming back through the ring. If there was a similar glitch in the sensor data of the ring that led back to humanity's home system—

“Holden?”

The security office around him was empty. Fred had cleared it for his “personal use”—meaning as the center for his private investigation of how deeply he had been compromised. The security personnel Holden had walked past coming in seemed nonplussed to be turned out of their own offices, but no one had raised any objection. Or at least none that he'd heard.

Fred stood in the archway of the short hall that led to the interrogation rooms. He was in civilian clothes, well tailored. A scattering of white

stubble dusted his chin and cheeks, and his eyes were bloodshot and the yellow of old ivory. His spine was stiff though, and his demeanor sharp enough to cut.

“Did you hear something?” Holden asked.

“I’ve had a conversation with an associate of mine who I’ve known for a long time. Light delay always makes these things painfully slow, but... I have a better idea what I’m looking at. A start, anyway.”

“Can you trust them?”

Fred’s smile was weary. “If Anderson Dawes is against me, I’m screwed whatever I do.”

“All right,” Holden said. “So where do we start?”

“If I could borrow you for a few minutes,” Fred said, nodding back toward the interrogation rooms.

“You want to question me?”

“More use you as a prop in a little play I’m putting on.”

“Seriously?”

“If it works, it’ll save us time.”

Holden stood. “And if it doesn’t?”

“Then it won’t.”

“Good enough.”

The interrogation room was bare, cold, and unfriendly. A steel table bolted to the floor separated the single backless stool from three gel-cushioned chairs. Monica was already sitting in one. The cut on her face was looking much better—little more than a long red welt. Without makeup, she looked harder. Older. It suited her. Fred gestured to the seat at the other side for Holden, then sat in the middle.

“Just look serious and let me do the talking,” he said.

Holden caught Monica’s gaze and lifted his eyebrows. *What is this?* She cracked a thin smile. *Guess we’ll find out.*

The door opened, and Drummer walked in. Sakai followed her. The chief engineer’s gaze flickered from Holden to Monica and back. Drummer guided him to a stool.

“Thank you,” Fred said. Drummer nodded and walked tightly out of the room. She might have been pissed at being kept out of the proceedings. Or maybe it was something else. Holden could see how something like this could lead to crippling paranoia pretty quickly.

Fred sighed. When he spoke, his voice was soft and warm as flannel. "So. I think you know what this is about."

Sakai opened his mouth, shut it. And then it was like watching a mask fall away. His features settled into an image of perfect, burning hatred.

"You know what?" Sakai said. "Fuck you."

Fred sat still, his expression set. It was like he hadn't heard the words at all. Sakai clenched his jaw and scowled at the silence until the pressure built up and it became too much to bear.

"You arrogant fucking Earthers. All of you. Out here in the Belt leading the poor skinnies to salvation? Is that who you think you are? Do you have any idea how fucking patronizing you are? All of you. *All* of you. The Belt doesn't need Earther bitches like you to save us. We save ourselves, and you assholes can pay for it, yeah?"

Holden felt a flush of anger rising in his chest, but Fred's voice was calm and soft.

"I'm hearing you say you resent me for being from Earth. Am I getting that right?"

Sakai leaned back on the stool, caught his balance, then turned and spat on the decking. Fred waited again, but this time Sakai let the silence stretch. After a few moments Fred shrugged, then sighed and stood up. When he leaned forward and hit Sakai it was such a simple, pedestrian movement, Holden wasn't even shocked until Sakai fell over. Blood poured down the engineer's lip.

"I have given up my life and the lives of people I care for a hell of a lot more than you to protect and defend the Belt," Fred growled. "And I am not in the mood to have some jumped-up terrorist piece of shit tell me different."

"I'm not scared of you," Sakai said in a voice that made it very clear to Holden he was desperately scared. Holden was a little unnerved himself. He'd seen Fred Johnson angry before, but the white-hot rage radiating from the man now was another thing entirely. Fred's eyes didn't flicker. This was the man who had led armies and massacred thousands. The killer. Sakai shrank from his pitiless regard like it was a physical blow.

"Drummer!"

The head of security opened the door and stepped in. If she was surprised, it didn't show in her face. Fred didn't look at her.

“Mister Drummer, take this piece of shit to the brig. Put him in an isolation cell, and be sure he gets enough kibble and water that he doesn’t die. No one in, no one out. And I want a complete audit of his station presence. Who he’s talked to. Who he’s traded messages with. How often he’s taken a shit. Everything goes through code analysis.”

“Yes, sir,” Drummer said, paused. And then, “Should I take the station off lockdown?”

“No,” Fred said.

“Yes, sir,” Drummer repeated, and then helped Sakai to his feet and ushered him out the door. Holden cleared his throat.

“We need to double-check the work on the *Rocinante*,” he said, “because there’s no way I’m flying something that guy did the safety inspections for.”

Monica whistled low.

“Schismatic OPA faction?” she said. “Well. It wouldn’t be the first time a revolutionary leader was targeted by the extreme wing of his own side.”

“It wouldn’t,” Fred agreed. “What bothers me is that they’re feeling secure enough to tip their hand.”

Chapter Nineteen: Naomi

The beer was vat-brewed: rich and yeasty with a little fungal aftertaste where the hops had been cut with engineered mushrooms. Karal was making hot-plate cousa: thin, unleavened cracker bread heavy with gum roux and hot onion. With Cyn and Naomi and a new man named Miral sharing air with Karal and the hot plate both, the recyclers were working near their top rate for the space. The heat and the spiced air, the closeness of bodies and the just-buzzed relaxation of the alcohol felt like falling backward through time. Like if she opened the door, it wouldn't be the dockside grunge of Ceres Station but Rokku's ship burning for the next claim or the next port.

"So Josie," Cyn said, waving one vast palm. He paused and turned a scowl to Naomi. "Kennst Josie?"

"I remember which one he is," Naomi said.

"Yeah, so Josie sets up shop there, sa sa? Start charging the Earthers to go down the corridor. Calls it..."—Cyn snapped three times, trying to call up the story's punch line—"calls it a municipal tollway. Tollway!"

"And how long did that last?" Naomi asked.

"Long enough we had to get off station before security grabbed us," Cyn said around a grin. Then he grew sober. "That was before, though."

"Before," Naomi agreed, lifting her glass. "Everything changed after Eros."

"Everything changed after the fuckers killed the *Cant*," Miral said, eyes narrowed at Naomi as if to say *That was your ship, wasn't it?* Another invitation for her to tell her stories.

She leaned forward a degree, hiding behind the veil of her hair. "Everything changed after Metis Base. Everything changed after Anderson

Station. Everything changed after Terryon Lock. Everything changed after everything.”

“Ez maldecido igaz,” Cyn said, nodding. “Everything changed after everything.”

Karal looked up. His expression was a mix of camaraderie and regret that meant *Everything changed after the Gamarra*.

Naomi smiled back. It had, and she was sorry too. Being here, with these men, brought up a kind of nostalgia that seeped into everything. All of them would have liked her to tell her stories—being on Eros, riding the first ship through the gate, trekking out to the first colony on the new worlds. Cyn and Karal wouldn’t ask, and so the new one followed their lead. And she kept her own counsel.

Filip was asleep in the next room, his body curled into a comma, his eyes merely closed. They weren’t the profoundly shut eyes of a sleeping baby. The rest of the cell were in other safe houses. Smaller groups drew less attention, and even if they lost one group, the rest could go on. It wasn’t something anyone had said. The strategy was familiar and strange at the same time, like a once-favorite song heard again after years of being forgotten. Karal scooped up the cousa, lifting it off the heating element and spinning it on his fingertips in the same motion. Naomi held out her hand, and he set the cracker down on her palm, their fingers brushing against each other. The simple physical intimacy of close companionship. Of family. It had been true once, and that it was less true now was forgiven by the fact that they all knew it wasn’t what it had been. Since she’d arrived, they’d all been careful not to let conversation stray into anything that put too fine a point on the gap of years she’d been absent.

And so when she broke the unspoken covenant, they would know she’d meant to. And as much as she didn’t want to undo the fragile moment, the only thing worse than talking about it was leaving it all unsaid.

“Filip is looking well,” she said, as if the words carried no extra significance. She bit the cracker, roux and onion flooding her tongue and the back of her nose with salt and sweet and bitter. She talked around it. “He’s grown.”

“Has,” Cyn said, his voice cautious.

Naomi felt years of grief and anger, loss and betrayal at the back of her throat. She smiled. Her voice didn’t waver. “How’s he been?”

Cyn's glance at Karal was nothing, a flicker almost too fast to notice. They were in dangerous territory now. She didn't know if they were looking to protect her from the truth or Filip and Marco from her. Or if they only didn't want a part of the drama that had been and still was her old lover and their son.

"Filipito's been good," Karal said. "Smart boy, and focused. Ser focused. Marco seen after him. Kept him safe."

"Safe as any of us ever are," Miral said, trying to make the words light. The hunger of curiosity was in the man's expression. He hadn't been there when Naomi and Marco had been together. It was like the rest of them were having a conversation, and half the words Miral couldn't hear.

"Que a mí?" Naomi asked.

"We all told him the truth," Karal said, a hardness coming into his voice. "Not going to lie to our own."

Cyn coughed once. He looked at her sideways, like a guilty dog. "When he got old enough to ask, him, Marco tells him how things got harsh. Too harsh. His mother, she needed to step away from it. Put ellas kappa together."

"Ah," Naomi said. So that was the story of who she was. The one who'd been too sensitive. Too weak. From where Marco sat, it might even look like the truth.

But then what must it have been to see who she'd become? XO of the *Rocinante*, survivor of Eros Station, traveler to new worlds. Looked at that way, "too harsh" was a strange thing. Unless it meant she just didn't love her son enough to stay. Unless what she'd run from was him.

"Filipito, he's solid," Cyn said. "Be proud of him."

"Nothing but," Naomi said.

"So," Miral said, his voice fighting and failing for casual. "You ship sui James Holden, yeah? What's that like?"

"Steady work. No room for promotion," Naomi said, and Cyn laughed. After a moment, Miral joined in ruefully. Only Karal kept quiet, and that might only have been from concentrating on the hot plate.

Naomi's hand terminal chimed. She picked it up. Two more messages from Jim. Her fingertip was a centimeter from the button to accept them. His voice was a few small movements away, and the thought pulled at her like a magnet. Hearing him now, even just his recorded voice, would be like

taking a long shower in clean water. She pushed the messages into her hold queue. Soon, and then all of them. But if she started now, she wouldn't stop, and she wasn't done yet. Instead, she put in a connection request to the address the Outer Fringe Exports representative had given her. A few seconds later, the connection hiccupped to life, a red border marking that the channel was secure.

"Ms. Nagata," the young man said. "How can I help you today?"

"Waiting on the ship," she said. "Need to know where we stand."

The man's eyes unfocused for a moment, then his smile sharpened. "We're waiting for the title transfer to update in the base registry, ma'am."

"So the payment's gone through?"

"Yes. If you'd like, you can take possession now, but please be aware you can't be cleared to leave port until the registry updates."

"That's fine," she said, getting to her feet. "Where's she berthed?"

"Dock six, berth nineteen, ma'am. Would you like a representative present for the handover?"

"No," she said. "Just leave the keys in the ignition, and we can take it from here."

"Of course. It's been a pleasure."

"Likewise," Naomi said. "Have a better one."

She dropped the connection. Cyn and Miral were already gathering their few things. Karal scooped up the last cousa from the hot plate with one hand and unplugged it with the other. She didn't need to tell them to alert the others. Cyn was already doing it. Without changing, the air in the room felt suddenly too thick, the heat from the hot plate and their bodies too oppressive. Naomi stepped through the doorway.

"It's time," she said, her voice gentle. She remembered all the drama feeds and films with a mother waking her child up for school. This was the closest thing she would ever have to that, and against her best judgment, she savored it. "Filip. We can go now."

His eyes opened, and for a moment, he wasn't wholly awake. He looked confused. Vulnerable. Young. And then his focus sharpened, and he was himself again. His new self. The one she didn't know.

They cycled the front door and stepped out into the corridor. The cool rotation breeze smelled of damp and ozone. She was still holding Karal's cousa half-eaten in her off hand. She took another bite, but it had gone cold

and the roux was clotting. She dropped what was left in the recycler and tried not to see it as a metaphor for anything else.

Cyn loomed up from the door, his face in its resting scowl. He looked older. Harder. She missed who he'd been when they were young. She missed who she'd been.

"Ready to go, Knuckles?" Cyn asked.

"Hell, yes," she said, and he looked at her more closely. Hearing, maybe, something more in the words than only the affirmation.

The ship was a simple transport skiff so small that the docking clamps holding it seemed about to crush its tarnished sides in. It didn't have an Epstein drive, so most of the hold would be taken up by the propellant mass. It would have to fly teakettle, and even then, a fair stretch of the way they'd be on the float. It was one step better than getting EVA suits and a bunch of extra air bottles, but it would do what they needed. Naomi had bought it at salvage rates, routing money from her share in the *Rocinante* through two anonymized accounts, one on Luna, the other on Ganymede. The final owner of record was Edward Slight Risk Abatement Cooperative, a company that had not existed before it appeared on the registration forms and that would vanish again when the ship was disposed of. The transponders would announce it as the *Chetzemoka*. In all, it represented about half of everything Naomi could call her own, and her name wasn't on any of the paperwork.

It didn't seem like enough. It seemed like too much. She didn't know what it seemed like.

Filip waited in the bay outside the boarding gantry, and so she did too. Cyn and Karal and Miral stood far enough away to give them something like privacy. The berth was a rental space with a red-numbered counter on the wall measuring the minutes left under agreement before its ownership changed. The metal and ceramic walls had the foggy look of sealant breaking down from the constant radiation of space. The air stank of lubricant. Someone had left an old poster on the wall, the split circle of the OPA with a hemisphere of Mars and one of Earth as the circle. Not just

OPA, but militant OPA.

They'd been her people, once.

The others arrived. Josie and Old Sandy. Wings, whatever his real name was. A thick-faced, sorrow-eyed woman with one missing tooth that Naomi hadn't seen before. A shaven-headed man with livid scars webbing the dark flesh of his scalp and the limp of an unhealed foot wound. More. Each of them nodded to Filip as they passed, their expressions a mix of respect and indulgence. All of them knew him better than she did. All of them would ship with him when he left. The ache behind her breastbone would have concerned her any other time. Just now, she knew what it was.

Soft tears threatened, but she blinked them back. Bit her tongue to stop them.

"All well?" Filip asked.

She laughed, and the tightness around her heart grew harder. "Well enough. As soon as the registry updates, we can file a plan and go."

"Good."

"Do you have a moment?"

His gaze flickered up to hers, something like anxiety in his eyes. A heartbeat later, he nodded once and pointed to the corner with his chin. They walked together, and the others gave them space. Naomi's heart beat like she was in danger. She could feel her pulse in her throat.

At the wall of the berth, she stopped. Filip turned to face her. The memory of him as an infant, toothless and grabbing onto her finger with a grin of unmistakable pride intruded powerfully into her mind and she took a moment to shove it away.

"It's been good seeing you," she said.

For a moment, she thought he wouldn't answer, then, "You too."

"The ship," she said. "When it's done, it's yours, all right?"

Filip looked over her shoulder toward the gantry. "Mine?"

"I want you to have it. Resell it, keep the money for yourself. Or hold it, if you want. Yours, though. No one else."

He tilted his head. "You're not coming with?"

"I didn't come here to join back in," she said, then sighed. "I came because he said you were in trouble. I came because of you. Whatever he's doing, whatever he's having you do, I can't be part of it. Not before. Not now either."

For a long moment, Filip didn't move. Her throat felt too narrow, like she couldn't get air through it.

"I understand," her son said. Her son who was leaving again. Who was going back to Marco and everything he was.

"Your father isn't a good man," Naomi said, the words spilling out. "I know you love him. I loved him too once, but he isn't..."

"You don't have to justify it," Filip said. "You did this for us, and I appreciate it. This is all you're willing to do, and that's disappointing, but he told me it might happen this way."

"You could come with me." She hadn't meant to say it, but as soon as she did, she meant it to her marrow. "The ship I'm on needs crew. We're independent and we're well stocked. Come do a tour with me, yeah? Get to... get to know each other?"

For the first time, a real expression cracked her son's reserve. Three thin lines drew themselves between his brows and he smiled with what could have been confusion or pity. "Kind of in the middle of something," he said.

She wanted to beg. She wanted to pick him up and carry him away. She wanted him back. It hurt worse than sickness that she couldn't have him.

"Maybe after, then," she said. "When you want it, you say it. There's room for you on the *Rocinante*."

If Marco lets you, she thought, but didn't say. If he doesn't hurt you as a way to punish me. And then, a moment later, God this will be weird to explain to Jim.

"Maybe after," Filip said, nodding. He put his hand out, and they held each other by the wrist for a moment. He turned first, walking away with his hands in his pockets.

The sense of loss was vast and oceanic. And it was worse because the loss wasn't happening now. It had happened every day since she'd left. Every day that she'd lived the life she chose instead of the one Marco had prescribed for her. It only hurt so badly now because she was seeing what all those days summed to and feeling the tragedy of it.

She didn't see Cyn and Karal coming up until they were there. She wiped her eyes with the heel of her palm, angry and embarrassed and afraid that a kind word would shatter the composure she still had. A kind word or a cruel one.

"Hoy, Knuckles," Cyn said, his landslide-deep voice low and soft. "So.

No chance kommt mit? Filipito's something. Know he's tight and thin right now, but he's still on mission. When he's not running herd, he can be funny. Sweet too."

"I left for reasons," Naomi said, the words feeling thick and muddy and true. "They haven't changed."

"Your son, him," Karal said, and the accusation in his voice was calming because she knew how to answer it.

"You know those stories about a trapped wolf chewing itself free?" she said. "That boy's my paw. I'll never be whole without him, but I'm fucked if I'll give up getting free."

Cyn smiled, and she saw the sorrow in his eyes. Something released in her. It was done. She was done. All she wanted now was to go listen to every message Jim had left her and find the fastest transport back to Tycho that there was. She was ready to go home.

Cyn spread his arms, and she walked into them one last time. The big man folded around her, and she rested her head on his shoulder. She said something obscene and Cyn chuckled. He smelled of sweat and incense.

"Ah, Knuckles," Cyn rumbled. "Didn't have to fall this way. Suis désolé, yeah?"

His arms tightened around her, pinning her arms to her sides. He reared back, lifting her feet off the deck. Something bit at the flesh of her thigh and Karal limped back, needle still in his hand. Naomi thrashed, slamming her knee into Cyn's body. The vicious embrace pressed the air out of her. She bit Cyn's shoulder where she could reach it and tasted blood. The big man's voice was soft and lulling in her ears, but she couldn't tell what the words were anymore. A numbness spread along her leg and up into her belly. Cyn seemed to fall with her locked in his arms, but he never landed. Only spun backward into space without his legs ever leaving the deck.

"Don't do this," she gasped, but her voice seemed to come from far away. "Please don't do this."

"Had to, Knuckles," Cyn said. "Was the plan immer and always, sa sa? What it's all about."

A thought came to her and then slid away. She tried to land her knee in his crotch, but she wasn't sure where her legs were anymore. Her breath was loud and close. Over Cyn's shoulder, she saw the others standing beside the gantry to the ship. Her ship. Filip's ship. They were all turned to

watch her. Filip was among them, his face empty, his eyes on her. She thought she might have cried out, but it could only have been something she imagined. And then, like a light going out, her mind stopped.

Chapter Twenty: Alex

When piloting a ship—any ship—there was a point where Alex's sense of his body reached out to subtly include the whole vessel. Coming to know how that individual ship felt as she maneuvered—how the thrust gravity cut out as that particular drive shut down, how long the flip took at the midpoint of a run—all of it made a deep kind of intimacy. It wasn't rational, but it changed how Alex felt about himself. His sense of who he was. When he'd gone from the massive, stately heft of the colony-ship-turned-ice-hauler *Canterbury* to the fast-attack frigate that had become the *Rocinante*, it had been like turning twenty years younger.

But even the *Roci* had tons of metal and ceramic. She could spin fast and hard, but there was an authority behind the movement. Muscle. Piloting the racing pinnacle *Razorback* was like strapping onto a feather in a thunderstorm. There was nothing to the ship but a blister the size of the *Roci*'s ops deck strapped to a fusion drive. Even the engineering deck was a sealed compartment, accessible to technicians at the dock. It wasn't the sort of ship the crew was going to maintain; they had hired help for that. The two crash couches huddled close together, and the compartments behind them were just a head, a food dispenser, and a bunk too small for Bobbie to fit in. There wasn't even a system to recycle food, only water and air. A maneuvering thruster could spin the ship around twice in ten seconds with power output that would have shifted the *Roci* five degrees in twice the time.

If piloting the *Rocinante* required Alex to think of the ship like a knight's horse, the *Razorback* begged for attention like a puppy. The screens wrapped around the couches and covered the walls, filling his whole visual field with the stars, the distant sun, the vector and relative

speed of every ship within a quarter AU. It threw the ship's performance data at him like it was boasting. Even with interior anti-spalling fabric a decade out of fashion and the grime and signs of wear on the edge of the couches, the ship felt young. Idealistic, feckless, and a little bit out of control. He knew if he spent enough time to get used to her, the *Roci* would feel sluggish and dull when he got back. But, he told himself, only for a little while. Until he got used to it again. The thought kept him from feeling disloyal. For sheer power and exuberance, the *Razorback* would have been an easy ship to fall in love with.

But she wasn't built for privacy.

"... as a community, Mars has got its collective asshole puckered up so tight it's bending light," Chrisjen Avasarala continued behind him. "But the prime minister's convoy has finally launched. When he gets to Luna, I'm hoping we can get him to say something that hasn't already been chewed by half a dozen diplomats playing cover-your-ass. At least he knows there's a problem. Realizing you've got shit on your fingers is the first step toward washing your hands."

He hadn't seen the old woman since Luna, but he could picture her. Her grandmotherly face and contempt-filled eyes. She projected a weariness and amusement as part of being ruthless, and he could tell Bobbie liked her. More, that she trusted her.

"In the meantime, you stay out of trouble. You're no good to anybody dead. And if that idiot Holden's plucking another thread in the same knot, God alone knows how he'll fuck it up. So. Report in when you can."

The recording ticked and went silent.

"Well," Alex said. "She sounds the same as ever."

"Give her that," Bobbie agreed. "She's consistent."

Alex turned his couch to look back at her. Bobbie made hers look small, even though it was the same size as his own. The pinnacle was doing a fairly gentle three-quarter-g burn. Over twice the pull of Mars, but Bobbie still trained for full g just the way she had when she was an active duty marine. He'd offered less in deference to her wounds, but she'd just laughed. Still, he didn't need to burn hard.

"So when you said you were working with her?" Alex said, trying not to make it sound like an accusation. "How different is that from working for her?"

Bobbie's laugh was a cough. "I don't get paid, I guess."

"Except for the ship."

"And other things," Bobbie said. Her voice was carefully upbeat in a way that meant she'd practiced hiding her discomfort. "She's got a lot of ways to sneak carrots to me when she wants to. My job is with veterans' outreach. This other stuff..."

"Sounds complicated."

"It is," Bobbie said. "But it all needs doing, and I'm in a position to do it. Makes me feel like I matter, so that's something. Still miss being who I was, though. Before."

"A-fucking-men," Alex said. The lift of her eyebrows told him he'd said more than he'd meant to. "It's not that I don't love the *Roci*. She's a great ship, and the others are family. It's just... I don't know. I came to it out of watching a lot of people I knew and kind of liked get blown up. Could have lived without that."

Bobbie's expression went calm, focused, distant. "You still dream about it sometimes?"

"Yeah," Alex drawled. It felt like confession. "You?"

"Less than I used to. But sometimes. I've sort of come to peace with it."

"Really?"

"Well, at least I'm more comfortable with the idea that I won't come to peace with it. That's kind of the same thing."

"You miss being a marine?"

"I do. I was good at it."

"You couldn't go back?"

"Nope."

"Yeah," Alex said. "Me neither."

"The Navy, you mean?"

"Any of it. Things change, and they don't change back."

Bobbie's sigh was like agreement. The vast emptiness between Mars and the Belt, between the two of them and the distant stars, was an illusion made by curved screens and good exterior cameras. The way the space contained their voices was more real. The two of them were a tiny bubble in a sea immeasurably greater than mere oceans. It gave them permission to casually discuss things that Alex normally found hard to talk about. Bobbie herself was in that halfway space between a stranger and a shipmate that let

him trust her but not feel a responsibility to protect her from what he thought and felt. The days out from Mars to Hungaria were like sitting at a bar, talking to someone over beer.

He told her his fears about Holden and Naomi's romance and the panic attacks he'd had on the way back to Earth from New Terra. The times he'd killed someone, and the nightmares that eventually replaced the guilt. The stories about when his father died, and his mother. The brief affair he'd had while he was flying for the Navy and the regret he still felt about it.

For her part, Bobbie told him about her family. The brothers who loved her but didn't seem to have any idea who or what she was. The attempts she'd made at dating since she'd become a civilian, and how poorly they'd gone. The time she'd stepped in to keep her nephew from getting involved with the drug trade.

Rather than trying to fold into the bunk, Bobbie slept in her couch. Out of unspoken solidarity, Alex did the same. It meant they wound up on the same sleep cycle. Bad for rotating watches, good for long meandering conversations.

They talked about the rings and the protomolecule, the rumors Bobbie had heard about the new kinds of metamaterials the labs on Ganymede were discovering based on observation of the Ring and the Martian probes reverse engineering what had happened on Venus. In the long hours of comfortable silence, they ate the rations that they'd packed and watched the scopes as the other ships went on their own ways: a pair of prospectors making for an unclaimed asteroid, the little flotilla escorting the Martian prime minister to Luna, a water hauler burning back out toward Saturn to gather ice for Ceres Station, making up for all the oxygen and hydrogen humanity had used spinning the rock into the greatest port city in the Belt. The tracking system generated tiny dots from the transponder data; the actual ships themselves were too small and far away to see without magnification. Even the high albedo of the Hungaria cluster only meant the sensor arrays picked them up a little easier. Alex wouldn't have identified that particular centimeter of star-sown sky as being different from any other if the ship hadn't told him.

The intimacy of the *Razorback* and shortness of the trip was like a weekend love affair without the sex. Alex wished they'd thought to bring a few bottles of wine.

The first sign that they weren't alone came when they were still a couple hundred thousand clicks out from Hungaria. The *Razorback's* external sensors blinked and flashed, the proximity reading dancing in and out. Alex closed down the false stars and pulled up tactical and sensor data in their place.

"What's the matter?" Bobbie asked.

"Unless I'm reading this wrong, this is the time when a military ship would be telling us that someone out there's painting us."

"Targeting lasers?"

"Yup," Alex said, and a creeping sensation went up his spine. "Which is a mite more provocative than I'd have expected."

"So there is a ship out here that's gone dark."

Alex flipped through the databases and matching routines, but it was just standard procedure. He hadn't expected to find anything and he didn't.

"No transponder signal. I think we've found the *Pau Kant*. I mean, assuming we can find her. Let's just see what we see."

He started a sensor sweep going in a ten-degree arc and popped open the comms for an open broadcast. "Hey out there. We're the private ship *Razorback* out of Mars. Couldn't help noticing you're pointing a finger at us. We're not looking for any trouble. If you could see your way to answering back, it'd ease my mind."

The *Razorback* was a racing ship. A rich kid's toy. In the time it took her system to identify the ship that was targeting them, the *Roci* would have had the dark ship's profile and specs and a target lock of her own just to make the point. The *Razorback* chimed that the profile data had been collected and matches were being sought. For the first time since they'd left Mars, Alex felt a profound desire for the pilot's chair in the *Rocinante*.

"They're not answering," Bobbie said.

"They're not shooting either," Alex said. "As long as they think we're just some yahoo out joyriding, we'll be fine. Probably."

Bobbie's couch hissed on its gimbals as she shifted her weight. She didn't believe it either. The moments stretched. Alex opened the channel again. "Hey out there, unidentified ship. I'm going to cut thrust here until I hear from you. I'm just letting you know so I don't startle anyone. I'd really appreciate a ping back, just so we all know we're good here. No offense meant."

He cut the drive; the grip of acceleration gravity loosened its hold on him. The gel of the couch launched him gently against his restraints. He could feel his heartbeat in his neck. It was going fast.

"They're deciding what to do about us," Bobbie said.

"That's my guess too."

"Taking them a while."

The *Razorback* announced a visual match, but it wasn't with the data Holden had sent them. The ship with its sights on them wasn't any of the colony ships that had gone missing out in the gates. With an eighty-nine percent certainty, it was a Martian naval corvette, floating dark. Behind him, Bobbie saw the same thing and drew the same conclusions.

"Well," she said. "Fuck."

Profile match completed, the *Razorback* returned to its scanning arc. Another passive contact. If the corvette was the *Pau Kant*, it wasn't out here alone. And then two more. And then six. The *Razorback* picked the nearest one and cheerfully started matching its profile. By reflex, Alex went to activate his point defense cannons. Only, of course, he didn't have any.

"Maybe they'll talk," Bobbie said. He could hear it in her voice that she didn't expect them to. He didn't either. Half a second later, the *Razorback* announced two fast-movers coming from the corvette.

He spun the pinnacle away from the missiles and punched the drive. The couch slammed into his back like a blow. Behind him, Bobbie grunted. With a mental apology to her, he pushed them to ten g, and the pinnacle leaped forward eagerly.

It wasn't going to be enough.

As light as the *Razorback* was, the missiles were an order of magnitude less mass to accelerate. And they didn't carry anything as fragile as a human body. They could pull a much heavier burn and close the gap to target in a matter of hours. He didn't have countermeasures to shoot them down, and there was nothing to hide behind. He didn't even have a load of cargo to drop out the back in hopes the missiles might blunder into it.

His vision started to narrow, darkening at the edges and dancing gold and fractured in the center. He felt the couch's needles slide into his thighs and neck, the juice like pouring ice water into his veins. His heart labored and he was fighting to breathe, but his vision was clear. And his mind. He had to think. His ship was fast, as ships went, but nothing compared to a

missile. There was no cover he could reach in time, and if the missiles were half as good as the ship that fired them, they'd be able to guide themselves right up his drive cone, no matter what he tried to huddle behind.

He could run away, draw the attackers into a line behind him, and then drop core. The vented fusion reaction would probably take out at least the first one. Maybe more. But then they'd be on the float, and at the mercy of a second volley.

Well. A bad plan was better than no plan at all. His finger twitched on the controls. The layout was unfamiliar and the fear that he was coding in the wrong information just because he wasn't on his own damned boat was like a stake in his heart.

Bobbie grunted. He wasn't strong enough to look back at her. He hoped it wasn't pain. High g wasn't a good thing for someone who'd had a bunch of holes pushed through her recently. He told himself it was just the needles feeding her the juice.

An alert popped onto his screen from Bobbie's console. PRIME MINISTER. GUARD SHIPS.

Between the drugs and the panic and the compromised blood flow in his brain, it took Alex a few seconds to understand what she meant. The *Razorback* didn't have point defense cannons or interceptor missiles, but the flotilla heading for Luna did. Alex pulled the data into the plotting system. There was no way they could reach the Martian ships before the missiles caught up with them, but it was just possible—barely—to get inside the range of their antimissile defenses. If he turned course now. If the Martians figured out what was going on and launched almost immediately. And the burn was going to be at the outer limit of what he or Bobbie could handle.

Almost without thinking, he engaged the maneuvering thrusters and the crash couches clicked to match the new vector. The missiles seemed to leap closer, correcting for the new course and anticipating where the pinnacle would be. He sent an emergency signal, broadcast on all standard frequencies, and hoped whoever saw it on the flotilla was a quick thinker. The two spheres—time-to-collision and Martian antimissile range—didn't overlap, but there were only a few hundred clicks between them. Barely an eyeblink at their relative speeds. He shifted to medical control and switched

Bobbie from juice to life support protocol.

Sorry, Bobbie, he thought. *I'd warn you if I had time, but you're gonna need to take a little nap if we don't want you bleeding out.* He watched her vital signs spike and then drop, her blood pressure and core temperature falling like a stone in the ocean. He pushed the ship to fifteen g.

His head hurt. He hoped he wasn't having a stroke, but it'd be fair if he did. Sustained fifteen g was a stupid, suicidal thing to do. He felt the air pressed out of his chest under the weight of his ribs, his skin. The sound of his gasping was like gagging. But the spheres touched now. Minutes stretched. Then fast-movers from the Martian flotilla. It had taken damned long enough, but the defenses were on the way. He tried to type in a message, warning the Martians that there were more ships out there, a dark fleet. He couldn't keep hold of the thought long enough to send it. His consciousness kept blinking, like the universe stuttering.

The medical system flashed up a warning, and he thought it was Bobbie, her old wounds reopening after all. But it was tagged for him. Something in his gut had ripped free. He canceled the alert and went back to watching death get closer.

They weren't going to make it. The lead missile was too close. It was going to take out the *Razorback* before the rescuers could come. Hadn't he had an idea about that? Something...

He wasn't aware of changing course. His fingers just did it. The spheres didn't touch anymore, until he switched to collision to track the second missile. Then, maybe. Maybe.

He waited. The lead missile closed. Five thousand kilometers. Four thousand. He vented the core.

Two hundred kilometers—

The crush of gravity vanished. The *Razorback*, still hurtling through space, stopped accelerating. Behind him, the lead missile died in the nuclear furnace of the rapidly diffusing core. The second missile jittered and turned to avoid the expanding cloud of superhot gas, and four lights burned before him, streaking across his screens so quickly he only knew them by their afterimages.

A fraction of a second later the Martian antimissile defenses destroyed the pursuing torpedo, but he had already lost consciousness.

Chapter Twenty-one: Naomi

Bist bien, Knuckles?” Karal asked.

The thin, slapped-together galley was too big for so small a crew. Bad design, waste of space. It wasn’t worn; it was cheap. She looked at him from behind the veil of her hair and smiled. “Fine, things being,” she said, making a joke. “Como sa?”

Karal shrugged with his hands. His hair had gotten gray over the years. And the stubble of his beard. It had been as black as the space between the stars once.

He looked at her eyes and she didn’t flinch. “Something to say, me.”

“No secrets between us now,” she replied, and he laughed. She smiled back. The prisoner flirting with the turnkey, hoping a kind thought in his head would help her later. Maybe it would.

The thing that frightened her most was how well she knew how to play it. From the moment she’d come back to consciousness, she talked when people talked to her, laughed when someone told a joke. She acted like her abduction was just one of those things that happens, like using someone’s tools without asking first. She pretended to sleep. Ate as much as she could past the tightness in her gut. And they all treated her like she was the girl she’d been, like they could all ignore the years and the differences, fold her back in as though she’d never gone away. As if she’d never been anyone else. Hiding her fear and her outrage slipped back on so easily, it was as if she’d never stopped.

It made her wonder whether perhaps she hadn’t.

“So I was one,” he said. “Helped with Filipito. Took care.”

“Good.”

“No,” Karal said. “Before that. Sometimes, he was with me.”

Naomi smiled. She'd been trying not to remember those desperate days after she'd told Marco she was leaving. The days after he'd taken Filip. To keep the boy safe, he'd said. Until she got her emotions under control, he'd said. A knot filled her throat, but she smiled past it.

"Those days. *You* had him?"

"Immer, no. But sometimes. Hijo moved, yeah? Night here, two nights there."

Her baby passed around among the people she knew. The manipulation of it was brilliant. Marco using his child as a marker of how much trust he placed in them and at the same time painting her as the crazed one. The dangerous one. Making sure the story in their community was about how solid he was and how close to cracked she'd come. She had the sudden powerful memory of Karal looking in from the kitchen while she broke down in his wife's arms. Souja, her name had been. What must her tears and profanity have looked like to him then?

"Kept it quiet," Naomi said, "and I wouldn't have known. So why say it here?"

Karal's hands shrugged again. "New day. New start. Looking to scrape off some old rust."

She tried to read from his face whether that was true, or if this was just another little cruelty in a form she couldn't call out without looking like the crazy one. If it had been back on the *Roci*, she would have known. But here, now, the balance between fear and anger and trying to control herself swamped little things like truth. It was the beauty of the way Marco had set her against herself. Tell her she was broken as a way to break her, and here they were a decade and a half past, and it still worked.

Then, for a moment, Amos was there, stronger in her memory than the surrounding ship. *It don't matter what's inside, boss. They only care what you do.* She didn't know if it was a memory or just her mind reaching for a place of certainty in an environment where nothing could be relied upon.

If Amos has become my personal touchstone for wisdom, I'm fucked, she thought, and laughed. Karal ventured a smile.

"Thank you for telling it straight," Naomi said. "New start. Scrape off the rust."

And if I ever get the chance to leave you behind in a fire, Karal, then good God you will burn.

A chime sounded, then the acceleration warning came on. She hadn't noticed when the ship had made its flip. Might have been when she was asleep, or slowly over the course of hours so that the rotation was subliminal. It didn't matter. She was cargo here. It didn't matter what she knew.

"Strap in, yeah?" Karal said.

"On my way," she said, launching herself gently to the ceiling, and then back to the deck at the crash couch between Cyn and Wings. It had turned out Wings' real name was Alex, but that space was taken in her mind, so he was Wings forever to her. He smiled to her and she smiled back as she strapped herself in against the gel.

The warning went from an amber glow to a ten-count in soft amber numbers, and at zero the couch lurched up against her, folding her a few centimeters in. The deceleration burn had started. When it stopped, they'd be where Marco was.

After the passageway linked the airlocks, she'd thought there would be some kind of farewell. Hugs and lies and all the things people did at the parting after a long journey. When it didn't happen, she understood that it had only been a long journey for her. The flight from Ceres to the empty space sunward of Mars and the Hungaria asteroids was like going from the couch to the head for them.

Filip emerged from the ops deck looking sharp and hard. No, that wasn't true. Looking like a boy trying to look sharp and hard.

"Check her for weapons," Filip said, biting at the words.

Cyn looked from Filip to Naomi and back. "Verdad? Knuckles been packing, she's been for a long time. Doesn't seem—"

"No prisoners on the *Pella* without a check," Filip said, pulling a fléchette gun from his pocket and not pointing it at her in particular. "Way it is, yeah?"

Cyn shrugged and turned to her. "Way it is."

Filip looked at her, his lips pressed thin. His fingers too aware of the trigger on his gun. He should have looked threatening, but he mostly looked

scared. And angry. Sending a son on a kidnap job was the sort of thing Marco would do. It wasn't that it was cruel, though it was cruel. It wasn't that it would corrode any relationship that they might have had, though it did that too. It was only that it would work. Even putting Filip on Ceres looked like a manipulation now. *Here is your son, where you left him. Come into the mousetrap and take him back.*

And she'd done it. She didn't know if she was more disappointed in Filip or herself. They were two very different kinds of disappointment, and the one pointed at her had more poison in it. She could forgive Filip anything. He was a boy, and living with Marco in his head. Forgiving herself was going to be harder, and she didn't have much practice.

When the outer airlock cycled, she suffered a wave of disorientation. The passage was the usual design of inflated Mylar and titanium ribs. There was nothing about it that looked strange. It wasn't until they'd nearly reached the other side that she recognized the smell of it: tangy and deep and probably carcinogenic. The outgassing of volatile organics from the cloth.

"This is new?" she said.

"We don't talk about it," Filip said.

"We don't talk about much, do we?" she snapped, and he looked back at her, surprised by the bite in her voice. *You think you know what I am*, she thought, *but all you've got is stories.*

The airlock of the other ship was weirdly familiar. The curve was like the airlock on the *Roci*, and the design of the latch. Martian design. And more than that, Martian Navy. Marco had come into a military ship. Inside, soldiers waited. Unlike the ragged group on Ceres, they wore a rough kind of uniform: gray jumpsuits with the split circle on their arms and breasts. Against the clean design of the ship's corridor, they looked like bad costumes in a play with good set design. The guns were real though, and she didn't doubt they'd use them.

The bridge looked like the *Rocinante's* younger brother. After the cheap, barely-enough aesthetic of the *Chetzemoka*, military-grade crash couches and terminal displays looked solid and reassuring. And there, in the center of it all like he'd posed himself, floated Marco. He wore something like a military uniform, but without any insignia.

He was beautiful as a statue. Even now, she had to give him that. She

could still remember when those lips and the softness in those eyes had made her feel safe. Lifetimes ago, that was. Now he smiled, and a strange relief spread through her. She was with him again, and unquestionably in his power. Her nightmare had come true, so at least she didn't have to dread it anymore.

"I've brought her, sir," Filip said, all his consonants sharp enough to cut with. "Mission accomplished."

"I never had a doubt," Marco said. In person, his voice had a richness that recorded messages lost. "Good work, mijo."

Filip gave a little salute, and spun to leave.

"Ah!" Marco said, pulling the boy up short. "Don't be rude, Filip. Kiss your mother before you go."

"You don't have to do that," Naomi said, but—eyes blank and empty—Filip floated over and pecked her cheek with dry lips before returning to the lift. The guards went with him, except for two that took up stations behind her.

"It's been a long time," Marco said. "You look good. The years have been kind to you."

"You too," she said. "Sound different too. When did you stop talking like a Belter?"

Marco spread his hands. "In order to be heard by the oppressing class, one must speak as a member of it. Not only the language, but the diction. The accusation of tyranny, however well-founded in fact, is dismissed unless it is delivered in the manner that power recognizes as powerful. That's why Fred Johnson was useful. He was already iconic of an authority that the authorities understood."

"So you've been practicing, then," she said, folding her arms.

"It's my job." Marco reached up, pushed his fingertips against the upper deck, and floated down toward the control couches. "Thank you for coming."

Naomi didn't answer that. She could feel him already rewriting the past. Treating her like she'd chosen to join him. Like she was responsible for being here. Instead, she nodded toward the ops deck. "Nice ride. Where'd you get it?"

"Friends in high places," Marco said, and then chuckled. "And strange, strange alliances. There are always people who understand that when the

world changes, the rules change with it.”

Naomi tugged at her hair, pulling it down over her eyes, and then, angry with herself, pushed it back. “So then. To what do I owe this setup bullshit?”

Marco’s hurt expression could have passed for genuine. “No setup. Filip was in trouble, you were in a position to get our son out of a bad place that had the potential to get a whole lot worse.”

“And paid for it by being pulled on your ship against my will? I can’t really thank you for that.”

“You should,” Marco said. “We brought you because you’re one of ours. To keep you safe. If we could have explained it all, we would have, but things are delicate, and you don’t stop to explain why you’re protecting someone when the danger’s close. The stakes are the lives of millions of Belters, and—”

“Oh please,” Naomi said.

“You don’t think so?” Marco said, a harshness coming into his voice. “You’re the one who killed us. You and your new captain. The minute those gates opened, all the rest of us were dead.”

“You’re still breathing,” Naomi said, but her anger sounded like petulance even to herself. He heard it that way too.

“You didn’t grow up down a well. You know how little the inners cared about us. The *Chesed*. Anderson Station. The Cielo mine fire. Belter lives don’t mean shit to inners. Never have. You know that.”

“They’re not all like that.”

“Some that pretend they aren’t, yeah?” The accents of the Belt slipped into his voice. And a rattling anger with them. “But they can still go down the wells. There’re a thousand new worlds, and billions of inners who can just step onto them. No training, no rehab, no drugs. You know how many Belters can tolerate a full g? Give them everything, all the medical care, the exoskeleton support mechs, nursing homes? Two-thirds. *Two-thirds* of us could go be cripples on these brave *néo* worlds, *if* the inners pulled together and threw all their money at it. You think that’s going to happen? Never has before. Last year, three pharmaceutical plants stopped even making their low-end bone density cocktails. Didn’t open the patents. Didn’t apologize to any ships don’t have budget for the high-end stuff. Just stopped. Needed the capacity for colony ships and all the new *ganga* they’re making with the

data coming back from the rings.

“We’re leftovers, Naomi. You and me and Karal and Cyn. Tia Margolis. Filip. They’re moving on, and they’re forgetting us because they can. They write the histories, you know what we’ll be? A paragraph about how much it sucks when a race of people go obsolete, and how it would have been more humane to put us down.

“Come. Tell me I’m wrong.”

It was the same ranting he’d done before, but perfected by years. A new variation of the same arguments he’d made on Ceres. She half expected him to say *The Gamarra had it coming. This is war, and anyone who helps choke out the enemy is a soldier whether they know it or not.* Her gut felt like it was made from water. It was a feeling she remembered from the dark times. Something in the back of her head shifted. The serpent of learned helplessness long asleep starting to wake. She pretended it wasn’t there, in hopes that if she denied it enough, it wouldn’t exist.

“What’s it got to do with me?” Naomi asked, less forcefully than she intended.

Marco smiled. When he spoke, it was back in the voice of the cultured leader. The rough-cut Belter thug vanished behind his mask. “You’re one of us. Estranged, yes, but one of us all the same. You’re the mother of my son. I didn’t want you in harm’s way.”

She was supposed to ask what that meant. The path was laid out before her in lights. *What do you mean, harm’s way?* she’d say, and he’d tell her. Watch her eyes go wide. See the fear in her.

Fuck that.

“Didn’t want me,” she said. “Wanted the *Rocinante*, only that didn’t work out. Was it the ship? Or was it Holden? You can tell me. Did you want to show off in front of my new boyfriend? Because that would be kind of sad.”

She felt her breath coming fast, adrenaline pumping through her. Marco’s expression hardened, but before he could speak, the comms chimed and a voice she didn’t recognize echoed on the deck.

“Hast contact,” the woman said.

“Que?”

“Little one. Pinnacle out from Mars. Talking to the *Andreas Hofer*.”

“Scout ship?” Marco snapped.

The pause stretched for seconds. Then, “Looks like just some pinché asshole wrong-placing it. Seen one, seen the whole strike force, though, yeah?”

“How long before the trigger impact?”

“Twenty-seven minutes.” There had been no hesitation. Whoever was on the other end of the comms had known the question was coming. Marco scowled at the control panel.

“Couldn’t have waited a little longer. Would have been prettier without. But fine. Take out the pinnacle.”

“Toda?”

Marco looked over at Naomi, his dark eyes on her. A smile touched his lips. Theatrical asshole that he was.

“No. No es toda. Launch the assault on the Martian prime minister’s ship too. And tell the hunt group to get ready, so that when the duster runs, we can take him down.”

“Sabez,” the woman said. “Orders out.”

Marco waited, hand out like a challenge. “This is the way,” he said. “Make it so they can’t forget us. Take chains they fashioned to bind us and use them as whips. We won’t go down to darkness. They’ll respect us now.”

“And do what? Shut down the Ring?” Naomi said. “Start making your cheap bone drugs again? What do you think shooting a Martian politician’s going to do for ‘our people’? How does that help anybody?”

Marco didn’t laugh, but he softened. She had the sense that she’d said something stupid, and it had pleased him. Despite it all, she felt a twinge of embarrassment.

“I’m sorry, Naomi. We’re going to have to take this up later. But I really am glad you’ve come back. I know there’s a lot of harsh between us, and that we don’t see the world the same way. But you’ll always be the mother of my son, and I will always love you for that.”

He lifted a fist to the guards. “Make sure she’s secure, then get ready for hard burn. We’re heading to the fight.”

“Sir,” one guard said as the other took Naomi by the elbow. Her first instinct was to resist, pull back, but what would the point have been? She pushed off for the lift, her jaw tight, her teeth aching.

“One thing,” Marco said, and she turned, thinking he was speaking to her. He wasn’t. “When you lock her down, make sure it’s someplace she

can watch a newsfeed. Today everything changes. Wouldn't want her to miss it, yeah?"

OceanofPDF.com

Chapter Twenty-two: Amos

Reports at this hour are that a massive asteroid has impacted northern Africa. The Oxford Center in Rabat, five hundred kilometers west of the event, is estimating eight point seven five on the Richter scale at the epicenter.”

Amos tried again to lean back in his chair. It was an uncomfortable little piece of furniture. Just crappy lightweight plastic to start with, then molded in a factory by a machine that didn’t have to sit in it. His first guess was that it had been designed specifically to be awkward and ineffective if you tried to hit someone with it. And then they’d bolted it to the floor. So every five minutes or so, he placed his heels on the textured concrete and pushed back without even knowing he was doing it. The chair bent a little under the pressure, but didn’t get more comfortable, and when he gave up, it bounced right back into its old shape.

“—unseen since Krakatoa. Air traffic is being severely affected as the debris plume threatens both civilian and commercial craft. For further analysis of the situation on the ground, we are going now to Kivrin Althusser in Dakar. Kivrin?”

The screen jumped to an olive-skinned woman in a sand-colored hijab. She licked her lips, nodded, and started talking.

“The shock wave hit Dakar just under an hour ago, and authorities are still taking stock of the damage. My experience is that the city is devastated. We have reports that many, many of the local structures have not survived the initial shock. The power grid has also collapsed. The hospitals and emergency medical centers are overwhelmed. The Elkhashab Towers are being evacuated as I speak, and there are fears that the north tower may have become unstable. The sky... the sky here—”

Amos tried to lean back in his chair, sighed, and stood up. The waiting room was empty apart from him and an old woman in the far corner who kept coughing into the crook of her elbow. It wasn't what you'd call a big place. The windows looked out on an uninspiring two hundred meters of North Carolina, bare from the entrance facility to the perimeter gate. Two rows of monofilament hurricane fencing blocked the path to a two-story concrete wall. Sniper nests stood at each corner, the automatic defense and control weapons stiller than tree trunks. The building was low—a single story peeking up out of the ground with administrative offices and a massive service entrance. Most of what happened here happened underground. It was exactly the kind of place Amos had never hoped to be.

Good thing was, when he was done, he could leave again.

"In other news, a distress call from the convoy carrying the Martian prime minister appears to be genuine. A group of unidentified ships—"

Behind him, the admin door swung open. The man inside looked like he was one hundred kilos of sculpted muscle and also tremendously bored. "Clarke!"

"Here!" the coughing old woman said, rising to her feet. "I'm Clarke!"

"This way, ma'am."

Amos scratched his neck and went back to looking at the prison yard. The newsfeed kept on being excited about shitty things going on. He'd have paid more attention to it if the back of his head hadn't been planning the ways he'd have pushed to get out of here if they'd sent him, and where he'd have died trying. From the parts he caught, though, it sounded like a good day for reporters.

"Burton!"

He walked over slowly. The big guy checked his hand terminal.

"You Burton?"

"Today I am."

"This way, sir."

He led him to a small room with more chairs bolted to the floor and a table too. The table was solidly made, anyway.

"So. Visitation?"

"Yup," Amos said. "Looking for Clarissa Mao."

The big guy looked up under his eyebrows. "We don't have names here."

Amos opened his hand terminal. "I'm looking for 42-82-4131."

"Thank you. You'll need to surrender all personal effects including any food or beverages, your hand terminal, and any clothing with more than seven grams of metal. No zippers, arch supports, anything like that. While you are inside the prison grounds, you are subject to reduced civil rights, as outlined in the Gorman code. A copy of the code will be made available to you at your request. Do you request a copy of the code?"

"That's all right."

"I'm sorry, sir. I need a yes or no."

"No."

"Thank you, sir. While in the prison, you are required to follow the directives of any guard or prison employee without hesitation or question. This is for your own safety. If you fail to comply, the guards and prison employees are authorized to use any means they deem necessary to ensure your safety and the safety of others. Do you understand and consent?"

"Sure," Amos said. "Why not?"

The big guy pushed a hand terminal across the table, and Amos mashed his thumb onto it until the print read. A little indicator on the side of the form went green. The big guy took it back along with Amos' hand terminal and shoes. The slippers were made out of paper and glue.

"Welcome to the Pit," the big guy said, smiling for the first time.

The elevator was steel and titanium with a harsh set of overhead lights that flickered just a little too quickly to be sure it was really flickering. Two guards apparently lived in it, going up and down whenever it did. So that seemed like a shitty job. At the tenth level down, they let him out, and an escort was waiting for him: a gray-haired woman with a wide face, light armor, and a gun in her holster that he didn't recognize. Something beeped twice as he stepped into the hall, but none of the guards tried to shoot anyone, so he figured it was supposed to do that.

"This way, sir," the escort said.

"Yeah. Okay," Amos said. Their footsteps echoed off the hard floor and ceiling. The lights were recessed into metal cages, making a mesh of

shadows over everything. Amos found himself flexing his hands and balling them into fists, thinking about how exactly he'd have to bounce the guard's head against the wall in order to get the gun off her. Nothing more than habit, really, but the place brought it out in him.

"First time down?" the escort asked.

"It show?"

"Little."

From down the hall, a man's voice lifted in a roar. A familiar calmness came over him. The escort's eyebrows went up, and he smiled at her. Her lips turned up in answer, but there was a different assessment behind it.

"You'll be fine," she said. "Right through here."

The hallway was brutal concrete; green-gray metal doors in a line with identical windows of thick green-tinted glass that made the rooms beyond look like they were underwater. In the first, four guards in the same armor Amos' escort wore were forcing a man to the ground. The woman from the waiting room huddled in the corner, her eyes closed. She seemed to be praying. The prisoner—a tall, thin man with long hair and a flowing beard the color of iron—roared again. His arm flashed out, quicker than Amos' eye could follow, grabbing one of the guards by the ankle and pulling. The guard toppled, but two of the others had what looked like cattle prods out. One of them landed on the prisoner's back, the other at the base of his skull. With one last obscenity, the iron-bearded man collapsed. The fallen guard rose back to her feet, blood pouring from her nose as the others teased her. The old woman sank to her knees, her lips moving. She took a long, shuddering breath, and when she spoke, she wailed, her voice sounding like it came from kilometers away.

Amos' escort ignored it, so he did too.

"Yours is there. No exchange of goods of any sort. If at any point you feel threatened, raise your hand. We'll be watching."

"Thanks for that," Amos said.

Until he saw her, Amos hadn't realized how much the place reminded him of a medical clinic for people on basic. A cheap plastic hospital bed, a steel toilet on the wall without so much as a screen around it, a battered medical expert system, a wall-mounted screen set to an empty glowing gray, and Clarissa with three long plastic tubes snaking into her veins. She was thinner than she'd been on the ride back from Medina Station before it

had been Medina Station. Her elbows were thicker than her arms. Her eyes looked huge in her face.

“Hey there, Peaches,” Amos said, sitting in the chair at her bedside. “You look like shit on a stick.”

She smiled. “Welcome to Bedlam.”

“I thought it was called Bethlehem.”

“Bedlam was called Bethlehem too. So what brings you to my little state-sponsored apartment?”

On the other side of the window, two guards hauled the iron man past. Clarissa followed Amos’ gaze and smirked.

“That’s Konecheck,” she said. “He’s a volunteer.”

“How’d you figure?”

“He can leave if he wants to,” she said, lifting her arm to display the tubes. “We’re all modified down here. If he let them take out his mods, he could transfer up to Angola or Newport. Not freedom, but there’d be a sky.”

“They couldn’t just take ’em?”

“Body privacy’s written into the constitution. Konecheck’s a bad, bad monkey, but he’d still win the lawsuit.”

“What about you? Your... y’know. Stuff?”

Clarissa bowed her head. Her laugh shook the tubes. “Apart from the fact that every time I used them, I wound up puking and mewling for a couple minutes afterward, they’ve got some other drawbacks. If we pull them out, I’d survive, but it would be even less pleasant than this. Turns out there’s a reason the stuff I got isn’t in general use.”

“Shit. That’s got to suck for you.”

“Among other things, it means I’m here until... well. Until I’m not anywhere. I get my blockers every morning, lunch in the cafeteria, half an hour of exercise, and then I can sit in my cell or in a holding tank with nine other inmates for three hours. Rinse, repeat. It’s fair. I did bad things.”

“All that shit the preacher pitched about redemption, getting reformed —”

“Sometimes you don’t get redeemed,” she said, and her voice made it clear she’d thought about the question. Tired and strong at the same time. “Not every stain comes out. Sometimes you do something bad enough that you carry the consequences for the rest of your life and take the regrets to the grave. That’s your happy ending.”

“Huh,” he said. “Actually, I think I know what you mean.”

“I really hope you don’t,” she said.

“Sorry I didn’t put a bullet in your head when I had the chance.”

“Sorry I didn’t know to ask. What brings you down here, anyway?”

“Was in the neighborhood saying goodbye to a bunch of my past, mostly. Don’t see how I’m coming back this way, so thought I’d better say hi now if I was going to at all.”

Tears welled up in her eyes, and she took his hand. The contact was weird. Her fingers felt too thin, waxy. Seemed rude to push her away though, so he tried to remember what people were like when they had an intimate moment like this. He pretended he was Naomi and squeezed Clarissa’s hand.

“Thank you. For remembering me,” she said. “Tell me about the others. What’s Holden doing?”

“Well, shit,” Amos said. “How much they tell you about what happened on Ilus?”

“The censors don’t let me see anything that involves him. Or you. Or anything involving Mao-Kwikowski or the protomolecule or the rings. It might be disruptive for me.”

Amos settled in. “All right. So a while back, Cap’n gets this call...”

For maybe forty-five minutes, maybe an hour, he laid out all the stuff that had happened since the *Rocinante* turned Clarissa Mao over to the authorities. Telling stories that didn’t have a punch line wasn’t something he had much practice with, so he was pretty sure that as story time went, it sucked. But she drank it up like he was pouring water on beach sand. The medical system beeped every now and then, responding to whatever was happening in her bloodstream.

Her eyes started to close like she was going to sleep, but her fingers didn’t lose their grip on his. Her breath got deeper too. He wasn’t sure if that was part of the medical whatever it was they were doing to her or something else. He stopped talking, and she didn’t seem to notice. It felt weird to sneak out without saying anything, but he also didn’t want to wake her up just to do it. So he sat for a while, looking at her because there wasn’t anything else to look at.

The weird thing was, she looked younger. No wrinkles at the sides of her mouth or eyes. No sagging in her cheeks. Like the time she’d spent down in

the prison didn't count. As if she'd never get old, never die, just be here wishing for it. It was probably some kind of side effect of the shit they'd pumped into her. There were kinds of environmental poisoning that did that too, not that he knew the details. She'd killed a lot of people, but he had too, one way and another. Seemed a little weird that she'd be staying and he'd be walking out. She felt bad about all the things she'd done. Maybe that was the difference. Regret and punishment the flip sides of the karmic coin. Or maybe the universe was just that fucking random. Konecheck didn't look like he had a lot of regrets, and he was locked up just the same.

Amos was about to start trying to get his hand free when the Klaxons went off. Clarissa's eyes shot open and she sat up, present and alert and not even sort of groggy. So maybe she hadn't been asleep after all.

"What is that?" she said.

"I was about to ask you."

She shook her head. "I haven't heard that one before."

It seemed like the right time to get his hand back. He went to the door, but his escort was already there coming in. She had her weapon drawn, but not pointing at anything.

"I'm sorry, sir," she said, and her voice was higher than it had been before. She was scared. Or maybe excited. "This facility has been put on lockdown. I'm afraid I'm going to have to ask you to remain in here for the time being."

"How long are we talking about?" he asked.

"I don't know the answer to that, sir. Until the lockdown is lifted."

"Is there a problem?" Clarissa asked. "Is he in danger?"

That was a good move. No guard ever gave a fuck whether the prisoner was in danger, so she was asking about the civilian. Even so, the escort wasn't going to say a goddamn thing unless she wanted to.

Turned out, she wanted to.

"A rock came down outside Morocco about three hours ago," she said, her sentence curling up at the end like it was a question.

"I saw something about that," Amos said.

"How did it get through?" Clarissa asked.

"It was going very, very fast," the escort said. "Accelerated."

"Jesus," Clarissa said, like someone had punched her in the chest.

"Someone dropped a rock on purpose?" Amos said.

“Rocks. Plural,” the escort said. “Another one came down about fifteen minutes ago in the middle of the Atlantic. There’re tsunami and flood warnings going out everywhere from Greenland to fucking Brazil.”

“Baltimore?” Amos said.

“Everyplace. Everywhere.” The escort’s eyes were getting watery and wild. Panic maybe. Maybe grief. She gestured with her gun, but it just looked impotent. “We’re on lockdown until we know.”

“Know what?” Amos said.

It was Clarissa that answered. “If that was the last one. Or if the hits are going to keep on coming.”

In the silence that came afterward, they weren’t guard, prisoner, and civilian. They were just three people in a room.

The moment passed.

“I’ll be back with an update as soon as I have one, sir.”

Amos’ brain ran through all the scenarios that came easy and didn’t see many options. “Hey, wait. I know it ain’t for pleasure viewing or nothing, but that screen over there catch newsfeeds?”

“Prisoners only get access in the common area.”

“Sure,” Amos said. “But I’m not a prisoner, right?”

The woman looked down, then shrugged. She took out her hand terminal, tapped in a few lines of text, and the empty gray screen flickered to life. A pale man with broad, soft lips was in the middle of his report.

“—undetected by the radar arrays, we are getting reports that there was a temperature anomaly that may have been related to the attack.”

The guard nodded to him and closed the door. He couldn’t hear it lock, but he was pretty sure it had. He sat back in his chair and propped his heels on the side of the hospital bed. Clarissa sat forward, her bone-thin hands knotted together. The feed switched over to a white-haired man talking earnestly about the importance of not jumping to conclusions.

“Do you know where the first one hit?” Clarissa asked. “Do you remember anything from the news?”

“I wasn’t paying attention. I think they said Krakatoa? Is that a place?”

Clarissa closed her eyes. If anything, she went a little paler. “Not exactly. It’s a volcano that blew itself up a long, long time ago. Sent ash eighty kilometers up. Shock waves went around the world seven times.”

“But it’s not North Africa?”

“No,” she said. “I can’t believe they really did it. They’re dropping rocks. I mean, who would even do that? You can’t... you can’t replace Earth.”

“Maybe you kind of can now,” Amos said. “Lot of planets out there now weren’t around before.”

“I can’t believe someone would do this.”

“Yeah, but they did.”

Clarissa swallowed. There had to be stairs around here. They’d be locked up so that prisoners couldn’t get to them, but Amos figured there’d have to be stairs. He went to the window to the hall and pressed his head against it. He couldn’t see anything down the hall either way. Kicking the glass out seemed unlikely too. Not that he was looking to try. Just thinking.

On the screen, a mushroom cloud rose over a vast and empty sea. Then, as a woman’s voice calmly talked about megatonnage and destructive capacity, a map was displayed with one bright red dot on North Africa, another in the ocean.

Clarissa hissed.

“Yeah?” Amos said.

“If the spacing’s even,” Clarissa said, “if there’s another one, it’s going to be close.”

“Okay,” Amos said. “Can’t do anything about that, though.”

The hinges were on the other side of the door too, because of course they were. It was a fucking prison. He clicked his tongue against his teeth. Maybe they’d take it off lockdown and send him on his way. Might happen. If it didn’t, though... Well, this was going to be a stupid way to die.

“What’re you thinking?” she asked.

“Well, Peaches. I’m thinking that I stayed on this mudball a day too long.”

Chapter Twenty-three: Holden

Holden sat back, light-headed, his eyes still on the screen. The immensity of the news made Fred's office seem fresh and unfamiliar: the desk with the fine black lines of wear at the corner; the captain's safe set into the wall like a little privacy window; the industrial carpeting. It was like he was seeing Fred, leaning forward on his elbows, grief in his eyes, for the first time. Less than an hour earlier, reports had come through with red frames around the feed windows to show how serious everything was. The previous headlines—a meteor or possibly a small comet had struck North Africa—were forgotten. The ships carrying the prime minister of the Martian Republic were being approached by an unknown and apparently hostile force, his escort moving to intercept. It was the news of the year.

Then the second rock hit Earth, and what might have been a natural disaster was revealed as an attack.

"They're connected," Holden said. Every word came out slow. Every thought. It was like the shock had dropped his mind in resistance gel. "The attack on the prime minister. This. They're connected, aren't they?"

"I don't know. Maybe," Fred said. "Probably."

"This is what they were planning. Your dissident OPA faction," Holden said. "Tell me you didn't know about this. Tell me you're not part of it."

Fred sighed and turned to him. The weariness in his expression was vast. "Fuck you."

"Yeah. Okay. Just had to ask." And then a moment later, "Holy shit."

On the newsfeed, images of Earth's upper atmosphere showed the strike like a bruise. The cloud of dust was smearing off to the west as the planet turned under it. The dust plume would keep widening until it covered the whole northern hemisphere—and maybe more—but for now it was just a

blackness. His mind kept bouncing off the image, rejecting it. His family was on Earth—his mothers and his fathers and the land he'd grown up on. He hadn't been back in too long, and now—

He couldn't finish the thought.

"We have to get in front of this," Fred said, to himself as much as Holden. "We have to—"

A communication request popped onto the side of the screen, and Fred accepted it. Drummer's face filled a small window.

"Sir, we have a problem," she said. "One of the ships we've got parked out there waiting to dock just put target locks on the main engines and the upper habitation ring."

"Defense grid up?"

"That's the problem, sir. We're seeing—"

The door of the office opened. The three people who came in wore Tycho Station security uniforms. One carried a large duffel bag; the other two had instruments in their hands that Holden struggled to make sense of. Strange hand terminals, or some sort of compact tool.

Or, guns.

Like someone speaking through the radio, a voice in the back of Holden's mind said *This is a coordinated, system-wide attack* just as the first woman fired. The sound alone was like being struck, and Fred toppled back in his seat. Holden scrambled for his own sidearm, but the second woman had already turned to him. He tried to drop down, to take cover behind the desk, but the two women fired almost simultaneously. Holden caught his breath. Something kicked him just below the rib, and he didn't know if he'd hit the edge of the desk or he'd been shot. He fired wild, and the man dropped the duffel bag. The first woman's head snapped back and she dropped to her knees. Someone else was shooting, and it took what seemed like minutes and was probably less than a second to realize it was Fred, supine behind the desk and firing between his feet. Holden had no idea where Fred had acquired a gun in the seconds since the attack started.

The second woman turned her gun toward Fred, but Holden took a breath and remembered how to aim, hitting her in the ribs. The man fled out the office door. Holden let him go and slid to the ground. There didn't seem to be any blood on him, but he still wasn't sure whether he'd taken a bullet. The first woman struggled to her knees, one blood-soaked hand pressing

her ear. Fred shot her again. She dropped. Like it was happening in a dream, Holden noticed that the duffel bag had fallen open. It had emergency environment suits in it.

When Fred shouted, his voice was strangely high and very far away. The gunfire had left them both almost deaf. “You’re a shitty bodyguard, Holden. Do you know that?”

“No formal training,” Holden shouted back. The words felt louder in his throat than they sounded in his ears. He became aware of another voice shouting, but not from here. From the desk console. Drummer. He stooped over Fred, ignoring her. Blood covered the man’s side, but Holden couldn’t see where the wound was.

“Are you okay?” Holden shouted.

“Just ducky,” Fred growled, hauling himself up. He winced, clenched his teeth, and took his seat. On the monitor, Drummer blanched.

“You’ll have to speak up,” Fred said. “Things got a little loud here. Holden! Secure the goddamn door.”

“Doors and corners,” Holden said, stepping over the bodies. “Always doors and corners.”

Outside, the security office was empty. A light was flashing on the wall. Emergency signal of some kind. Now that he knew to listen for it, he could hear the alarm. Evacuation warning. Someone was evacuating the station ring. That couldn’t be good. He wondered if the good guys had sounded the alert, or if it was just part of the plan. A distraction while something even worse happened. He was having a hard time catching his breath. He had to keep checking to make sure he hadn’t been shot.

He looked at the gun in his fist. *I think I just killed someone*, he thought. And someone dropped a rock on Earth. And then they tried to kill Fred. It was bad. It was all just bad.

He didn’t notice Fred coming up behind him until he took Holden’s elbow, leaning against him for support and pushing him forward at the same time.

“Look alive, sailor,” Fred said. “We’ve got to go. They’ve fired a torpedo at us, and some ratfucker sabotaged my defense grid.” Fred was cursing more than usual. The stress of combat waking up the long-dormant marine inside of him.

“They’re shooting the ring?” Holden said.

“Yes. And in particular, they’re shooting at my office. I’m starting to get the feeling they don’t like me.”

Together, they struggled forward. In the wide corridor, people were scampering to hardened shelters and evacuation stations.

An older man with close-shaved hair and a mouth set in a permanent grimace saw Fred and the blood. Without a word, he took Fred’s far arm across his shoulder.

“Are we heading to medical bay or evac?” Grimace asked.

“Neither one,” Fred said. “The bad guys are trying to take engineering. My men got jumped. They’re pinned down, and there are two enemy torpedoes on their way to disable the engines. We’ve got to relieve our people, and get the grid back up. See if we can’t start firing back.”

“Are you joking?” Holden said. “You’ve been shot. You’re bleeding.”

“I’m aware of that,” Fred said. “There’s a security transfer up here to the left. We can take it. Get to the construction sphere. What’s your name, chief?”

Grimace looked at Holden, asking by his expression who Fred was talking to. Holden shook his head. Fred knew his name already. “Electrician First Class Garret Ming, sir. Been working for you about ten years, one way and another.”

“Sorry I haven’t met you before,” Fred said. “You know how to use a gun?”

“I’m a quick study, sir.”

Fred’s face was gray. Holden didn’t know if it was blood loss or shock or the first symptoms of a deeper despair. “That’s good.”

Tycho Station was built like a ball half a kilometer across. The construction sphere was big enough to accommodate almost any ship smaller than a battleship in its interior space. At rest, the two rings at its equator gave spin gravity to a city’s worth of the Belt’s best engineers and technicians. The great drives at the sphere’s base could move the station anywhere in the system. Or out of it, now. Tycho had overseen the spinning up of Ceres and Pallas. It was the beating heart of the Belt and its loudest boast. The

Nauvoo, the ship that would have taken humans to the stars, had been too large to fit inside the construction sphere, but it had been built in space next to the massive station. There was no better place for the construction of grand dreams than Tycho. Along with the terraforming of Mars and the farms of Ganymede, it was a living testament to humanity's ambition and skill.

Holden would never have imagined it could feel fragile.

The transfer from ring to construction dome was like taking a particularly awkward lift. They began at the full one-third g of the station, lurched, and their weight began to leach away. When doors opened again, they were in free fall. The blood that had started dripping from Fred's arm was a fluid coating now, the liquid held to his body by surface tension as it gradually thickened into a kind of jelly. Garret was covered with it. Holden was too. He kept expecting Fred to pass out, but the old man didn't lose focus or determination.

Visible from the long translucent tube of the access corridor, the construction sphere looked like a network of purified functionality. Other corridors curved between the ship berths, the walls tiled with a subtly repeating pattern of access panels, power transfers, storage and equipment lockers, and mech parking plates. The steel and ceramic bones of the station showed everywhere, and the light was as bright and harsh as sunlight in vacuum. The air in the access corridor was sweet with the scent of carbon lubricant and electrical discharge. Together, the three of them pulled themselves headfirst toward station south, the engineering decks, and the massive fusion reactors. Holden's body couldn't decide if he was falling down a long, bent well or swimming along an underground river of air.

"Drummer!" Fred snapped. "Report."

The audio feed from his hand terminal was confused for a moment, then the woman's voice came, her syllables clipped, calm, and measured in a way that sounded like the professional version of raw panic.

"Understood. Main engineering has been shut down by the hostiles. They are holding auxiliary engineering with a force of approximately twenty well-armed enemy, sir. We're in a mutual holding action."

"Can you disengage?"

"Not safely, sir. They can't move, but neither can we."

"Do we know—"

Something loud happened on the other end of the terminal, and a second later, a bone-deep ringing shuddered through the corridor. Garret swore under his breath.

“The first torpedo has made impact, sir,” Drummer said.

“The ring?”

“No, sir. The drive cone. The torpedo targeting the ring hit a few minutes ago, but failed to detonate.”

“Small favors,” Fred said. “Do we know the armament of the insurgents?”

“Small automatic weapons. Some grenades.”

“Can you shut down their air?”

“There’s a manual cutoff, but I haven’t had the spare manpower yet.”

“I’ve got an electrician first class with me,” Fred said. “Tell me where to take him.”

“Understood. We’re looking at an access on service deck four. Environment controls Delta-Foxtrot-Whiskey-slash-six-one-four-eight.”

“They had vacuum suits,” Holden said. “The ones in your office. They had emergency suits. Turning off the air may not matter.”

Drummer answered from Fred’s hand terminal. “We’ll keep them in place until their bottles run out if that’s what we need to do.”

“Good,” Fred said. “We’re on our way.”

“Don’t stop for beer, sir,” Drummer said, and the background hiss of the connection dropped. Fred made a small, satisfied grunt and pushed himself farther down the hall.

“It’s not going to work,” Holden said. “They’ll figure out what we’re doing and cut through a bulkhead or something.”

“You know the difference between a code and a cipher, Holden?”

“What?”

“A code and a cipher. Cipher, you encrypt text so that no one can tell what the words in the message are. A code, you say the words right out in the open, but you change what they mean. Anyone with a smart computer and a lot of time can break a cipher. No one can break a code.”

Holden launched himself across a wide intersection where three passageways came together. For a moment, the station extended around him on all three axes. Fred and Garret floated close behind him but pushed off faster, so that they reached the far side before him. Fred turned to his left

and gestured for them to follow.

“Service deck four’s the other way, sir,” Garret said.

“But the four people on the ambush team are this way,” Fred replied. His words were getting slushy. “Level six, section fourteen, berth eight. Once we’re in position, I’ll try to pull the bad guys out, and we’ll take them in the flank.”

Holden thought for a moment. “You had a whole system set up in case this happened. But what if Drummer had been one of them?”

“I had other systems set up with Oliver, Chu, and Stavros,” Fred said. “Secure, open communications with whoever I had left.”

“Tricky,” Holden said.

“I’ve been doing this sort of thing for a while.”

The ambush team was where Fred said it would be: three male Belters and a woman with the thick build of Earth, all in light armor with riot guns and suppression grenades. Fred gave Garret a short-barreled shotgun and a position at the rear where he could be both useful and safe. One tried to tend to Fred’s gunshot wound, but he waved the man away.

Near the bottom of the station, the curve of the corridors was tighter, the horizon close. They were less than ten meters from the doors to auxiliary engineering, and the bent wall offered them cover. When the time came, they’d have to get even closer.

Holden’s hand terminal vibrated in his pocket. Around a red frame, the newsfeed announced a third rock had struck Earth. Holden thumbed it off. If he let himself think about what was happening around the rest of the solar system now, he couldn’t think about what was about to happen in this corridor. Still, his throat felt thick and his hands had a shudder he couldn’t entirely control. His family was on Earth. Amos was on Earth. And Alex was in a tiny ship someplace not too far from the Martian prime minister’s convoy. And Naomi was... somewhere. That he didn’t know where made it worse.

“Be okay,” he murmured. “Just be okay.”

“What?” Fred said.

“Nothing. I’m ready.”

Fred opened a connection. “Drummer. Killing the air is a no-go. We’re going to have to pull in heavy artillery. I have a squad of combat marines I scraped out of a bar. They’re coming to relieve you now.”

“Understood,” Drummer said. Holden thought there was a smile in her voice. “Make it fast, though. We’ve got two down. I’m not sure we can hold much longer.”

“Ten minutes,” Fred said, raising his bloodied left hand in the Belter idiom for *Take position*. The ambush team steadied their weapons. Holden did too. It took the people holed up in auxiliary engineering almost five minutes to decide they should make a break for it.

The door popped open, and the first half dozen or so of the enemy streamed out of engineering. They were dressed like normal people: security uniforms, technicians’ jumpsuits, the sort of casual clothing Holden would have seen in a bar or in the corridors. They were just people, citizens of Tycho. Of the Belt. They took positions that gave them cover from Drummer’s suppressing fire, unaware at first of the second team. At Fred’s signal, the six of them opened up, though Holden was aware that he wasn’t trying very hard to hit anyone. A second wave tried to get out of engineering as the first one tried to retreat back into it. Drummer’s force moved forward with a barrage of gel rounds and suppression grenades that burst into foam and hardened to stone almost instantly.

In half a minute, the fight was over. Fifteen minutes later, the defense grid was back up, and the attacking torpedo boat was burning hard for someplace in among the Trojan asteroids. It was almost an hour before the real cost became clear.

With the station in relative safety, Fred had allowed himself to be taken to the medical bay. The gentle gravity of the ring was still enough to show how weak he’d become. The expert system inserted four needles, inflating him with artificial blood, and the color began to come back to his face. Holden, sitting at the bedside, watched the readouts without really seeing them. He wanted to check the newsfeeds about Earth, and he also didn’t. The longer he could put it off, the longer he didn’t have to think about it. When Drummer came in with the damage report, it was almost a relief. Another distraction.

“The torpedoes cracked the drive cone,” she said.

“How badly?” Fred asked.

“Do you want to fly this thing on a patched-up cone? Badly enough that we’re going to manufacture a new one.”

“Fair enough,” Fred said.

“At least they didn’t blow the ring,” Holden said. “If that one hadn’t been a dud—”

Drummer’s face went still. “About that. We were mistaken. The enemy fired a weapon with the hull and drive of a torpedo, but they rigged it with a salvage mech on the end. Ran it into your office, sliced through the exterior decking, and pulled half the wall away with them.”

Fred blinked.

“*That* was why they needed EVA suits,” Holden said. “I was wondering. But it seems like a pretty weird way to get to you. Peeling your office open like a sardine can.”

“They weren’t after me,” Fred said, then paused and said something obscene.

“What?” Holden said. “What is it?”

Drummer answered. Her voice had the same professional calm she’d used in the firefight. “The enemy took the wall that had Colonel Johnson’s safe. It won’t be easy getting it open, but with enough time and resources, we have to assume they will.”

“But they already compromised your command structure, right? Any sensitive information they get, they probably already had?”

Holden knew even before Fred said it, but he wanted to give the universe a chance to prove him wrong. Make it so that the worst possible thing hadn’t happened.

“They got the sample,” Fred said, making it a reality. “Whoever did this? They now have the protomolecule.”

Chapter Twenty-four: Amos

Wouldn't the density figure in?" Clarissa asked. Whatever crap they'd been feeding into her bloodstream, it had run out. She was starting to look a little better. He could still see the veins under her parchment-thin skin, but she was getting some color back in her cheeks.

"Sure, but that's all energy you'd put in getting the rocks up to speed in the first place. You drop a slug of tungsten out of a ship or a fucking feather pillow, you've still got to get the ship going whatever speed you're aiming for. All that price got paid at the front, energetically speaking."

"But a pillow would have burned up before it hit ground."

"Okay, now *that's* a fair point."

On the screen, the newsfeed showed the strikes again and again, looting footage from as many different sources as they could find—terminals, security cameras, high-orbit mapping satellites. The bolt of ionized air glowed like the trail of a rail gun, and North Africa bloomed a massive rose of fire, again and again. Another beam-like trail in the air, and the Atlantic Ocean went from a vast expanse of slate-blue water to an expanding circle of eerie green and then spewed white and black to the sky. It was like the reporters thought if they all just kept looking at it, it would start making sense.

Millions of people were dead, and millions more would be in the next few hours as the tsunamis and flooding hit. Billions would go in the next few weeks and months. The Earth had become a different planet since he'd gone underground. It wasn't the sort of thing you could make sense of by staring at it, but he couldn't look away either. All he could do was talk to Peaches about trivia and wait to see what came next.

The man doing the voice-over had a gentle European accent and a sense

of calm that probably meant he'd sucked down a lot of pills. Or it might have been tweaked and enhanced by the sound techs. "The weapons remained undetected by radar until they entered the Terran atmosphere, less than a second before impact."

The image shifted to an apocalyptic satellite image: five frames in a loop showing the Atlantic impact and the raw shock wave rolling out from it across the ocean. The scale was massive.

"You see," Amos said, pointing a thumb at the screen, "that's how you know they were using radar-absorbing coating on the rocks. Burned off and stopped working after they hit atmo, right? Anyway, you figure it went from the ionosphere to sea level in about half a second, so that's about two hundred klicks per. I'm making this up here, but the kind of bang they're talking about, you could do it with a block of tungsten carbide maybe three and a half, four meters to a side. That ain't big."

"You can figure all that in your head?"

Amos shrugged. "My job has been playing with magnetically contained fusion reactions for a lot of years now. It's the same kind of math, more or less. You get a feel for it."

"I can see that," she said. And then, "You think we're going to die?"

"Yup."

"Of this?"

"Maybe."

On the screen, the newsfeed replayed a five-second clip from a sailing boat. The flash of perfectly straight lightning, the weird deforming lens of the pressure wave bending the air and light, and the image shattered. Whoever had been in the ship, they'd died before they knew what they were looking at. Probably the most common last words that day were going to be *Huh, that's weird*. That or *Oh shit*. Amos was aware in a distant way that his gut hurt, like he'd eaten a little too much food. Probably fear or shock or something. Clarissa made a small sound in the back of her throat. Amos looked over at her.

"I wish I'd seen my father again."

"Yeah?"

She was silent for a moment. Then, "If he'd done it? If he'd figured out how to control the protomolecule? Everything would have been different. This wouldn't be happening."

“Something else would be,” Amos said. “And if you’d ever seen that thing up close, you wouldn’t think it was better.”

“Do you think Captain Holden would ever—”

The floor rose up and punched Amos in the legs. By instinct, he tried to roll, but the attack was too wide. There was no way to get around it. The screen shattered; the lights failed. Something loud happened. For a few seconds, he was rattled around the room like dice in a box, not knowing what was hitting him. Everything went black.

An endless moment later, the amber emergency light flickered on. Clarissa’s bed was on its side, the girl poured out of it to the floor. A pool of clear liquid widened around the medical expert system, filling the air with a pungent smell like coolant and alcohol. The thick wire-and-bulletproof-glass window had shattered in its frame and was now opaque as snow. A network of cracks laced the wall. From the corner, Clarissa’s half-panicked laughter bubbled up, and Amos felt his own feral smile rise up to meet it. An alarm was sounding, the wail rising and stuttering and rising again. He didn’t know if it was supposed to sound like that or if the shock wave had broken it.

“You all in one piece there, Peaches?”

“Not sure. My hand really hurts. May have broken something.”

He got to his feet. He hurt everywhere. But long familiarity with pain told him nothing was seriously damaged, so he shoved the hurt to one side and ignored it. Either the ground was still shaking a little or he was. “Well, if you did, that’ll suck.” The door to the hall was closed, but it looked wrong. Like the frame had warped. He wondered if it would ever open again.

“We’re ten stories underground,” Clarissa said.

“Yeah.”

“If it was like this for us, how bad is it up top?”

“Don’t know,” Amos said. “Let’s go see.”

She sat up. Her left hand was already swollen to about twice the size of the right one, so something in it was busted. In her prison gown, she looked like a ghost. Something already dead that hadn’t stopped moving yet. Which, he figured, might be accurate.

“We’re on lockdown,” she said. “We’re not going anywhere.”

“Thing is, for us to be in lockdown, this has to be a prison. For this to be

a prison, there has to be, you know, a civilization out there. I think this just turned into a big hole in the ground with a bunch of dangerous people in it. We should leave.”

He kicked the door. It was like punching a bulkhead with a bare fist. He moved over and tried the shattered window. It was only a little bit better. He tried three more times before a voice shouting from outside interrupted him. “Stop that immediately! We’re in lockdown!”

“Someone doesn’t know this isn’t a prison anymore,” Clarissa said. She sounded a little drunk. Might be a concussion to go with her broken hand.

“In here!” Amos shouted. “Hey! We’re stuck in here!”

“We are in lockdown, sir. You have to stay where you are until—”

“The wall’s cracked,” Amos shouted back. “It’s gonna collapse.” It might even have been true.

There was a long moment of quiet, and then a click from the doorway. The door scraped open a couple centimeters and jammed. The escort looked in. Dim emergency lighting from down the hall turned her into a grayscale outline. Even so, he could see the fear in her expression. There were other people behind her, but he couldn’t make them out.

“I’m sorry, sir,” she said, “but this facility is—”

Amos put his shoulder against the door, not pushing out, but not letting her close it again either.

“In lockdown. I got that,” he said. “Here’s the thing, though. We need to evacuate.”

“You can’t, sir, this is—”

“Not just us,” Amos said. “You too. You need to get out of here too. Unless you’re really looking to die at work, which I would find disappointing.”

The escort licked her lips. Her gaze cut to the right. He tried to think what would convince her the rest of the way, but the best he came up with was punching her in the jaw and hoping he could push his way out before anyone shot him. He was cocking back his arm when Clarissa put a hand on his shoulder.

“You’ve got people on the top, don’t you?” she said. “Friends? Family?”

The escort’s gaze lost focus, seeing something else. Someone else. Probably someone dead but not cool yet. “I can’t... I can’t think about that right now.”

“Penal regulations say that you have the responsibility to maintain the safety and health of prisoners in your custody,” Clarissa said. “You won’t get in trouble for leading an evacuation. You’ll be a hero.”

The escort was breathing heavily, like she was doing some kind of hard physical labor. Amos had seen people do that kind of thing when they were upset about something, but he didn’t really understand it. Clarissa moved him gently aside and leaned in toward the escort.

“You can’t be part of a relief effort up there if you’re buried alive down here,” the girl said, softly. Like she was apologizing for something. “There might be aftershocks. The walls might collapse. There’s no dishonor in evacuating.”

The escort swallowed.

Clarissa leaned in, almost whispering. “There’s a civilian in here.”

The escort said something under her breath that Amos didn’t quite catch, then turned to talk over her shoulder. “Help me get this goddamned door open, Sullivan. The structure’s compromised, and we’ve got a fucking civilian in here that we need to get to safety. Morris, if that bastard tries anything, take him down hard. You understand, asshole? One wrong move, and we’ll end you.”

Someone in the corridor laughed, and it sounded like a threat. Amos and Clarissa backed up. Two new hands took hold of the door and started hauling it back open.

“Keep the civilian safe? That’s what got to her?” Amos asked.

Clarissa shrugged. “It was the excuse she needed. Though you *are* a precious flower.”

“Well, sure. Just not used to anybody appreciating it.”

The door opened with a shriek, swinging into the corridor only halfway before it stuck fast. Probably permanently. In the hallway, the damage was clearer. A crack ran down the center, three or four centimeters lower on one side than the other. The air was thicker than it had been coming in; Amos felt the reflexive urge to check the air recyclers. Maybe that wasn’t even wrong. Being thirty-odd meters underground was a lot like being in vacuum. If things were busted enough, atmosphere was going to be a problem.

The other prisoner—Konecheck—knelt on the ground, a second guard—Morris—standing three paces behind him with a weapon pointed at the

man's back. If it was a gun, it wasn't a design Amos recognized. The prisoner's face was swollen all down the left side like he'd lost a boxing match with a very slow ref. The escort, two other guards, Peaches, and this fella.

Konecheck looked up from behind strands of long iron-gray hair and gave a one-millimeter nod. Amos felt a wave of something a lot like comfort pass through him—a looseness across his shoulders, a warmth in his gut. This was going to get ugly before it was over, but it was a scale of violence he understood.

"New plan," the escort said. "We're evacuating these prisoners and the civilian to the surface."

The guard who'd helped pull the door open—Suliman? Sullivan? Something like that—was a thick-necked bull of a man with a single black eyebrow running across his forehead. Morris, the one with the gun, was thinner, older, with bad teeth and missing the last knuckle on his left pinky finger.

"Sure you don't want to put the prisoners in a closet before we go?" Morris asked. "I'd feel a lot better getting out of here if we didn't have these fucking psychos at our back."

"Peaches comes with me," Amos said with a loose shrug. "That's just a thing."

"Might need some help clearing debris," Konecheck said. He'd been the one that laughed before. The words, innocuous as they were, held just as much threat but the others didn't seem to hear it. Amos wondered why that was.

"Elevators are disabled, so we'll get to the stairs," the escort said. "That'll get us out of here. Once we're up top, we can secure the prisoners."

"What about fallout?" the thick guard—Amos was almost sure the name was Sullivan—said.

"That's nukes, asshole," Konecheck growled.

"Rona? Shouldn't you query the captain before we do this?" Morris asked. His eyes hadn't shifted off Konecheck's back. *Competent*, Amos thought, and filed the information away for later.

"Captain's not answering," the escort, Rona, said. Her voice was tight, too controlled to let the panic out. From the way the other two went quiet, Amos guessed they hadn't known that. "Let's head for the stairs. Morris,

you take lead, then the prisoners, then me and Sully. You'll need to follow behind, sir."

"I'll walk with them," Amos said.

"Don't trust me with your girlfriend?" Konecheck growled.

Amos grinned. "Nope."

"Let's get moving," Rona said. "Before there's a fucking aftershock."

Fear was an interesting thing. Amos could see it in all the guards without quite being able to point to what it was. The way Morris kept looking over his shoulder, maybe. Or the way Rona and Sullivan walked exactly in step behind them, like they were trying to agree with each other just by the length of their stride. Peaches seemed focused and empty, but that was kind of just her. Konecheck, on Amos' left, was jutting out his beard and making a big show of what a badass he was, which would have been funnier if he didn't have a nervous system redesigned for violence. Guys like that were either scared all the time anyway or so broken they didn't count. Amos wondered whether he was scared. He didn't know how he'd tell. He also wondered if there were going to be more rocks falling, but it didn't seem like the kind of thing he had any say over.

All around them, the prison was in shambles. Cracks ran along the walls like the floor had been shoved out a couple centimeters and pushed back in place. There was a sound of water running through pipes from somewhere. The emergency lights were on, but here and there a few had failed, leaving pools of darkness. Even if the elevators were running, he wouldn't have wanted to take them. One of the things living on a ship for years had done was give him a sense for how the whole vessel was running based on a few local indicators. And if the Pit had been above orbit, he'd have been sleeping in an environment suit, just so as not to be unpleasantly surprised by waking up airless.

"Stop fucking whistling," Konecheck said.

"Was I whistling?" Amos asked.

"You were," Clarissa said, still cradling her swollen hand.

"Huh," Amos said, and started whistling again, consciously this time.

"I said stop it," Konecheck growled.

"Yeah," Amos agreed with a friendly nod. "You did say that."

"Prisoners will maintain silence," Rona snapped behind them. "And the civilian will kindly shut the fuck up too."

Amos considered Konecheck out of the corner of his eyes. Still too early to be sure, but maybe sixty-forty that one of them was going to have to kill the other. Not now, but before it was over. He could hope for the forty.

A shudder passed through the floor like a badly tuned thruster firing. Concrete dust sifted down from the lights like amber snow. Morris said something obscene.

"Aftershock," Rona said. "Just an aftershock."

"Might be," Clarissa said. "Might be the shock wave from Africa. I don't remember how fast that kind of force travels through the mantle."

"Not fucking North Africa," Konecheck said. "No way we'd feel that."

"When the Galveston plant went up, the shock wave was still measurable on its third time around the planet," Clarissa said.

"Oh, the bitch is a history professor now?"

"The prisoners will maintain silence!" Rona shouted. She was sounding a lot more agitated. Around a corner, a light glowed green, the icon of a thick-legged stick man walking up steps. He wondered how many other people were on this level, still in lockdown, waiting on rescue. How many were already trudging up the stairs on their way out. The guards were playing it pretty close to the vest, but he'd have bet good money that there were a whole lot of people making their own decisions right now.

Morris stopped at the door to the stairway. The readout set into the wall beside it showed a red image of a closed lock until he swiped his hand terminal across it and keyed something into the display that opened. The lock switched to green, and the door slid open. Of course a prison would put the locks on the emergency power circuit, Amos thought. He wondered what else was locked.

A landslide of mud, water, rocks, concrete, and rebar spilled into the corridor. Morris yelped and jumped back, then fell to the ground, grabbing one shin. His pants were ripped, and Amos caught a glimpse of a dark wetness between the man's fingers. Blood.

"Morris!" Rona said. "Report!"

"I'm gonna need stitches."

"I'm moving ahead to look," Amos said, leaving *So don't shoot me* as a given. Beyond the door, the stairway was gone. Rubble and dirt were so thick, he couldn't even tell if the stairs still existed under them. He couldn't tell where the water was coming from, but it smelled clean. Which meant it

was probably the drinking water. Another tremble shook a few stones and a head-sized ball of concrete loose.

Sullivan was muttering a stream of obscenities under his breath that sounded less like anger and more like the first signs of panic. Amos shook his head.

“No one’s getting out that way,” he said. “Not without a few months and a digging mech. We’re gonna have to find another way up.”

“There isn’t a goddamn other way up,” Rona said. “That’s the evacuation route. That right there.”

“Peaches?”

Clarissa’s voice was calm but still a little slurred. “Hard call, Amos. It’s a prison for high-risk criminals. They don’t put a lot of easy egress routes in it.”

“Fair enough,” Amos said. “But say you had to think of something clever?”

“The guards have overrides. If we can get access to the elevator shaft and the car’s not blocking it, we might be able to climb up.”

“Ten stories at one g on a broken hand?” He didn’t mention the possible concussion that was probably screwing with her sense of balance.

“Didn’t say it’d be fun.”

“The access ladders are all locked down,” the escort said. “They put doors across them so no one can get up without permission.”

Konecheck gave a wide, mirthless laugh, and Sullivan trained another of the strange not-quite-guns on him.

“Peaches?”

“I don’t know. Maybe we could find something else.”

Amos stretched his neck, the vertebrae popping like firecrackers. “This,” he said, “is getting to be a long fucking day.”

Chapter Twenty-five: Naomi

Hour by hour, history rolled out, every new moment making things worse. The newsfeeds from Earth and Mars, and then reports from Tycho Station and Ganymede filled with reporters and journalists blank with shock or else weeping. The hammering of Earth took most of the bandwidth: images from an apocalypse. Cities along the coasts of the Atlantic with grinding waves shattering fourth-and fifth-story windows. An army of small tornados forming behind the shock wave's leading edge. The planet she was so used to seeing glow as the city lights made it a permanent fire, going dark. The field hospital at Dakar where ash and stones rained down upon row after row of the dead. The shaking UN spokesman confirming the death of the secretary-general. The void between the planets was alive with chatter and speculation, reports and theories and then conflicting reports and theories. With the complexity of light delay, it was almost impossible to put events in order. Everything seemed to be happening at once.

Which, she supposed, was how Marco had wanted it.

The events in other places—things that would have been shattering on any other day—seemed footnotes to the grand thesis of destruction playing out on Earth. Yes, there had been an attempted coup on Tycho Station, but the Earth was dying. Yes, an OPA cell had taken control of the ports on Ganymede, but the Earth was dying. Yes, a battle was going on between Martian escort ships and an unknown force near the Hungaria asteroids, but Earth was dying. The sense that something vast had descended on all humanity was inescapable.

Outside, in the common room, elated voices rose with each new report, cheering with delight. In her assigned quarters, she watched with a growing numbness. And beneath it, something else. After half a shift, she turned the

screen off. Her own face reflected in the emptiness that followed looked like another stunned reporter searching for words and failing. She pulled herself out of her crash couch and walked out to the common room. It was so much like the *Roci*'s galley that her brain kept trying to recognize it, failing, and trying again. An utterly unfamiliar space would have been easier than this architectural uncanny valley.

"Hoy, Knuckles," Cyn said, rising from among the crowd. "A que gehst, yeah?"

She made an automatic Belter's shrug, but Cyn didn't sit back down. Not the question of a friend wondering where she was going, but of a guard demanding information of a prisoner. She arranged her expression more carefully.

"This was why, wasn't it? This was why he wanted me?"

"Marco son Marco," Cyn said, and his voice was weirdly gentle. "He thought we should get you, so did, yeah? Why does why matter? Still the safest place to be in the system right here."

Naomi took a long breath and blew it out.

"Lot to take in," she said. "Big."

"Is that," Cyn said. Naomi looked at her hands, her fingers laced together. *Act like one of them*, she thought. What would she do if she were one of them again? The answer came too naturally. As if she *was* one of them. As if she always had been.

"Ship's got an inventory," she said. "I can do the checks. Be useful."

"I'll join," he said, falling into step with her.

She knew where to go, how the lift would take her, where the machine shop was. In the years she'd been on the *Roci*, she hadn't been aware that she was also internalizing the design logic of the Martian Navy, but she had been. When they reached the shop, she knew where the diagnostic arrays would be stored even though she'd never set foot in the place before.

Cyn hesitated before he opened the cabinets, but only a little. Checking inventory, testing batteries and relays and storage bubbles, was something everyone did in their spare time if they grew up in the Belt. It was as natural as drinking water, and when she picked up an array, he did too. The door to the cargo bay was sealed, but it cycled open for Cyn.

The bay was well-stocked. Magnetic pallets locked to the decks and walls in neat rows. She wondered idly where it had all come from, and what

promises had been given in exchange. She went to the nearest, plugged the array into the pallet, and popped it open. The crates unfolded. Batteries. She took the first, snapped it into the array. The indicator went green, and she snapped the battery back out, replaced it, and took the next one.

“All going to be good,” Cyn said. “Military grade, this.”

“Well thank God militaries never get shit wrong.” The indicator went green. She swapped the battery in her hand for the next one. Cyn went to the next crate over, popped it, and started doing as she was doing.

She recognized it as a kindness. He hadn’t come down to be her friend, but her jailer. He could as easily have put her back in her cabin and locked the door to keep her there, but he hadn’t. He could have stood guard over her while she worked through the batteries, but he didn’t. He pretended that they were together on the task, equals. Even if it meant missing beer and Armageddon with his friends. Against her will, Naomi felt a spark of gratitude for that.

“Big day,” she said.

“A long time coming,” Cyn said.

“Long time,” she agreed automatically.

“Got to be weird seeing him again.”

She pulled another battery, checked it, put it back, grabbed the next one. Cyn cleared his throat.

“Mé falta,” he said. “Shouldn’t have said it.”

“No, it’s fine,” Naomi said. “Yes, it’s weird seeing him again. Did a lot to get away from him last time. Didn’t see ever coming back.”

“Bad times.”

“Those or these?”

Cyn coughed out a laugh and looked over at her, a question in his eyes. “These? Esá the promised land. Belt standing up. You know how it was before. You remember running thin because we couldn’t get enough oxygen. Breaking bones because the meds got taxed too much.”

“I do,” she said, but Cyn was on a roll now, and he wasn’t ready to stop. He put down his array and stared at her. The sympathy had burned out of him, and there was a rage in his eyes. Not with her. With something bigger.

“I got three cousins died because Earth corporations wouldn’t sell the good cancer meds to Belters. Gave us the crap left over from the farms on Ganymede. Only vat meats aren’t like people, yeah? Don’t work the same,

but who cares? Tio Bennett got his ship taken away because he was behind on his permitting. He wasn't even in a pinché Earther dock, but he didn't pay, so they boarded him, dropped him on Ceres, and sold his rig. And for what? They protect us from pirates? They protect us from third-rate manufacturers passing off old suits as new? They care if we got shot? If we got killed?"

"I know they don't."

"Didn't, Knuckles. They *didn't*. Because past is the past now. Today," Cyn said, poking the air with his thumb. "You been flying on their side for a lot of years, and maybe not *tu falta*. Things before, keeping Filipito away, maybe we all did that wrong, yeah? But I'm starting to think you been sharing a couch with an Earth coyo so long you forgot what you *are*. Started thinking maybe you're like them."

No, she wanted to say. *No, I never forgot*. But even as she formed the words, she wasn't sure if they were true. Once, there had been a girl with her name who had belonged here. Who'd felt the rage she saw in Cyn and in Filip. There had been a time when she could have cheered the deaths on Earth. But Jim was from Earth. And Amos. Alex from Mars, which from a Belt perspective was more or less the same thing. And what was she? Their pet Belter? The one that didn't belong? She didn't think so. So then, she was something else.

And still, how well had they known her, really? There was so much she hadn't said. She didn't know what would have changed if she had.

Cyn was scowling at her, his eyes hard, his jaw set. She tried to retreat back behind the curtain of her hair, but it wasn't enough. Not here. Not now. She had to say something; she had to react or it would be the same as confessing, and she was done taking responsibility for things she hadn't chosen. She tried to think what Jim would have said, but imagining him was like touching an open wound. Guilt at keeping her past from him and the grief and longing of being away from him and the fear that something bad had happened to him on Tycho. Or was happening to him, right now, while she could do nothing about it. She didn't know what Jim would do, and didn't dare to imagine him.

All right. Amos, then. What would Amos do?

She took a deep breath, let it out. When she looked up, she brushed her hair away. Grinned. "Well, Cyn. That's one way of looking at things," she

said, leaning into the words. “Ain’t it?”

Cyn blinked. Whatever he’d expected, it hadn’t been that. She checked the last battery on her pallet, replaced it, and shut the box back down. Cyn was still looking at her, his head turned a degree to his left. It made him seem wary of her.

Good.

She nodded at the open pallet at his feet. “You going to check those?” she asked. “Or d’you need some help?”

By dinner, it seemed like the attacks were done. The feeds, on the other hand, were in full swarm. She sat at a table that, like everything on the ship, seemed too familiar. Cyn sat on her right, and a young woman she didn’t know on her left. Her plate was heaped with fried mushroom in hot sauce, the way Rokku used to make it. She ate it one-handed, the way the others did, and wondered whether someone looking over the room would have been able to pick her out as the one that didn’t fit.

The screen was set to a feed coming out of Tycho Station. She watched it and tried not to feel anything. When Monica Stuart appeared, she felt a shock of fear that she couldn’t quite explain. The woman made an introduction that told Naomi nothing new, then turned to Fred Johnson sitting stiffly across from her. He looked old. He looked tired. She didn’t watch him, barely listened to them speak, straining instead at the edges of the screen in case Jim was there. The others were heckling and catcalling anyway. She caught fragments.

“Do you believe that you were the primary target of the attack?”

“That appears to be the case.”

“Fucking liar!” someone across the galley shouted, and the others roared their approval. Including Cyn.

Fred moved carefully, and the camera stayed close on his face. He was hurt then, and hiding it. She’d heard once that birds back on Earth would do everything they could to hide that they were ill. Any visible weakness was an invitation to attack. The comparison made Fred Johnson seem vulnerable. Maybe everything was vulnerable now. “The attackers are in

custody, and we hope very soon to have a clear idea who was behind this.” Something about that caught her. It was odd, knowing Marco, that he hadn’t made a press release of it. He’d brought her here to show off, hadn’t he?

Or had he? She was supposed to bring the *Rocinante* with her, and they’d been disappointed when she didn’t. Was the ship what he’d really wanted? Or Jim? She wondered with a sense of dread what would have happened if she hadn’t come alone.

And then, as if thinking had summoned him, Monica Stuart ended the interview with Colonel Fred Johnson, voice of the OPA and director of Tycho Station, and turned instead to Captain James Holden.

Her breath stuttered.

“I understand you were working as a bodyguard for Colonel Johnson,” Monica said.

“Yes, that’s true,” Jim said with a little grimace. He hadn’t done a very good job of it apparently. “It wasn’t really needed. The people who infiltrated the security team turned out to be a very small minority. He wasn’t ever in real danger.”

He was lying. Naomi pushed her food away.

“Is it true that there was a secondary target? There are some people reporting that the attack may have been cover for some kind of theft.”

Annoyance flashed in Jim’s eyes. She wondered if anyone else saw it. Monica was probably pushing into territory that they hadn’t agreed on. Or had agreed to avoid. “They’re not reporting that to me,” Jim said. “As far as I know, apart from some damage to the station, the coup was a total failure.” Another lie.

“Switch the feed!” someone shouted. A chorus of agreement rose. Someone called Jim something insulting, and Cyn glanced over at her and then away. Naomi went back to her food. The hot sauce burned her lips, but she didn’t mind. The screen switched to a major newsfeed from Earth. The reporter was a young man in a black raincoat. The text said he was in someplace called Porto. The buildings behind him were a mix of ancient and new, with thick, muddy water tearing at them all. On the higher ground behind him, there were rows of sacks. No, body bags.

“That was him, wasn’t it?”

She didn’t know how long Filip had been standing behind her. The girl to her left nodded to Filip and fled. The boy took the empty seat. Wisps of

stubble stretched along the line of his jaw, black against the golden brown of his skin. He turned to look at her, and his eyes took a moment to find her, like he was drunk. “That was the man you left us for, si no?”

Cyn grunted like he’d been hit. Naomi didn’t know why. The question was so wrong it was actually funny.

“Not how it played,” she said. “But yes. I ship with him.”

“He’s handsome,” Filip said. She wondered whose voice he was echoing. It didn’t sound like Marco. “Wanted to say, about your being here? Wanted to say.”

But then he didn’t go on to actually finish the thought. She wondered whether she saw regret in his eyes, or if she was imagining it because she wanted it to be there. She didn’t know what to say, how to answer. It felt like there were many versions of her—the captive, the collaborator, the mother reunited, the mother who went away—and all of them spoke differently. She didn’t know which was her real self. If any of them.

Probably, it was all.

“Not the way I’d have chosen,” she said, stepping through the words like they were sharp. “But that’s true of a lot of things, yeah?”

Filip nodded, looked down. For a moment she thought he’d move away, and didn’t know whether she wanted him to stay or go.

“It’s me up there now, you know,” Filip said. “On the feed? That’s me.”

The reporter was older than Filip, broader across the face and shoulders. For a moment, she tried to see a resemblance between them, and then like walking into a freezer, she understood.

“Your work,” she said.

“Gave it to me as a present,” Filip said. “The stealth coating on the rocks? I led the team that retrieved it, me. Without me, none of this.”

He was boasting. It was in the corner of his eyes and the tightness of his lips how badly he wanted her to be impressed. To approve. Something like rage shifted in her gut. On the screen, the reporter was listing relief organizations and religious groups. People who were trying to organize help for the refugees. As if anyone on the planet didn’t need refuge now.

“Did that to me too,” she said. Filip’s expression asked the question. “Your father. He put blood on my hands too. Made me complicit in killing people. Thought it would make me easier to control, I guess.”

It was the wrong thing to say. The boy flinched, drawing into himself

like a snail's feeler touched with salt. The feed changed. The dead and missing on Earth had topped two hundred million. A cheer went up all through the galley.

"Is that why you left?" Filip asked. "Couldn't handle doing the work?"

She sat silent for a long moment. Then, "Yes."

"Better that you went, then," Filip said. She told herself he didn't mean it. It was just something he said to hurt her. It worked. But more than that, she felt a vast sorrow for all the things her baby boy might have been that he wasn't. For the child she could have had in him, if there had been a way. But she'd left her child in the hands of a monster, and the infection had spread. A family of monsters, father and mother and child.

It made it easier.

"Weighed on me," she said. "All those dead people because of what I'd done. I tried to leave. Told him I wouldn't turn him in if he just let me take you and go. So instead he took you away. Said I was acting crazy, and he didn't trust me around you. That if anyone was getting turned in, it would be me."

"I know," Filip said. Spat. "He told me."

"And I was going to have to do it again. And again. And again. Kill more people for him. I tried to do it too. Tried to push through. Let them die. He tell you I tried to kill myself?"

"Yeah," Filip said. She should stop. She didn't need to put this on him. Her little boy. Her little boy who'd just helped kill a world.

God, she still wanted to protect him. How stupid was that? He was a murderer now. He needed to know.

"I was at an airlock on Ceres Station. Rigged it to open. All I needed to do was step out. It was an old-style one. Blue and gray. And it smelled like fake apple. Something about the recycler there. And, anyway, I did it. I triggered it. Only the station had put in a fail-safe I didn't know about. So." She shrugged. "That was when I knew."

"Knew what?"

"That I couldn't save you. You could have a gone mother or a dead one. Those were all the options."

"Some people aren't meant to be soldiers," Filip said. It was meant to cut, but she was past feeling now.

"The only right you have with anyone in life is the right to walk away. I

would have taken you with me if I could. But I couldn't. I would have stayed if I could. But I couldn't. I would have saved you if I could."

"I didn't need saving."

"You just killed a quarter of a billion people," she said. "Someone should have kept that from happening."

Filip stood, his motions wooden. For a moment, she saw what he would look like as a man. And what he had been as a boy. There was a deep pain in his eyes. Not like her own. His pain was his, and she could only hope he would feel it. That he would at least learn to regret.

"Before you kill yourself," she said, "come find me."

He pulled back a centimeter, as if she'd shouted. "Con que I do something stupid like that? Soy no coward, me."

"When it comes," she said, "find me. Nothing can ever take it back, but I'll help you if I can."

"You're merde to me, puta," Filip snapped and stalked away. Around the galley, the others stared or pretended not to. Naomi shook her head. Let them look. She was past caring. She didn't even hurt. Her heart was vast and dry and empty as a desert. For the first time since she'd taken Marco's call on Tycho, her mind was clear.

She'd almost forgotten Cyn was there until he spoke. "Harsh words for his big day."

"Life's like that," she said. But she thought, *This isn't the big day.*

In her memory, Marco spoke. *In order to be heard by the oppressing class, one must speak as a member of it. Not only the language, but the diction.* But he hadn't made his pronouncement yet. Not in any diction. She didn't know his plans. Likely no one but Marco knew all of them.

But whatever his grand design was, it wasn't over yet.

Chapter Twenty-six: Amos

Sullivan died when they were about fifteen meters up the shaft.

The plan, if you wanted to call it that, was open the elevator shaft doors, then boost up a level and pry those open. Each level could be a staging area for getting to the next, and by the time they got to where the car was stuck at the very top level, they'd have enough experience with the layout they'd maybe be able to find a way to get past it or get the guards posted in it to let them through. Anyway, it was a problem they could solve once they got there.

It took about an hour to get the first set of doors opened. They defaulted to locked, for one thing. For another, the mass of the doors was a lot more than the usual lift gates. In the end, it had taken Amos, Sullivan, and Morris on one door and Konecheck with his modifications on the other to pry them open enough to slip through. Twice, the ground had shaken, and the second time harder than the first; the whole damned planetary mantle was ringing like a struck bell. By the end, Amos was starting to get thirsty, but he didn't see the point in mentioning it.

The shaft was in darkness, which Amos had expected. It was also wet, which he hadn't. Black drops like filthy rain pattered down from above, smearing the walls and making them slick. He couldn't tell if it was leaking through from one of the floors above them or if the building at the ground level had been sheared off. The guards had flashlights, but all the beams showed were dirty steel walls and a recessed track that the car ran on. A set of repeating steel access panels ran along beside the track looking like cabinets stacked one on top of the other, going up forever into the gloom.

"That's the maintenance ladder," Rona said, playing a circle of white light over the cabinet doors. "The doors retract, and there's handholds."

“That’s great,” Amos replied, leaning out into the empty air. The shaft went down another three meters or so. The black soup at the bottom might have gone deeper than that, but he was hoping not to find out. The air smelled like ashes and paint. He didn’t want to think too much about what was leaking into the shaft or where it was coming from. If the whole place was ass-deep in toxic crap, it didn’t change what they had to do.

The gap between floors was maybe half a meter. Craning his neck, he could see the lines of the elevator doors set flush into the wall. Not so much as a fingerhold. He thought maybe there was something way at the top of the shaft—a spot of brightness that came and went in an eyeblink.

“Can we get to the next doors?” Clarissa asked from behind him. “What’s it look like?”

“It looks like we need a plan C,” Amos said, coming back into the prison hallway.

Konecheck chuckled, and Sullivan turned on the man, lifting the gun-like thing to the prisoner’s head. “You think that’s funny, asshole? You think it’s all so fucking amusing?”

Amos ignored the homicidal tension in the air and looked at the gun. It wasn’t like anything he’d put his hands on before. The grip was hard ceramic with a contact interface running along the seam. The barrel was short and square and as wide across as his thumb. Konecheck loomed up over Sullivan, his swollen face a mask of rage and defiance, which was fine as long as it stopped there. “You going to use that, little man?”

“What’s it shoot?” Amos asked. “Tell me it ain’t one of those riot gear things. They give you real bullets down here, don’t they?”

Sullivan turned to him, the gun still trained on Konecheck. Amos smiled and very slowly, gently put his hand on the guard’s arm and drew it down.

“What the hell are you talking about?” Sullivan asked.

“Plan C,” Amos said. “That thing. Shoots real bullets, right? Not gel rounds or some wimpy shit like that?”

“They’re live rounds,” Morris said. “Why?”

“I was just thinking about how a gun makes a shitty metal punch.”

“Where are you going with it?” Clarissa asked.

“Thinking we’ve got three shitty metal punches,” Amos said. “Maybe we can punch some metal.”

The guns were biometrically linked to the guards in case someone like

Peaches or Konecheck got hold of them, so Amos and Rona lowered themselves down into the muck instead of Amos going alone. The black sludge came up to Amos' ankle, cold and slick. The lowest of the cabinet-like doors had its edge under the dark surface. Amos rapped on the metal with his knuckles, listening to the sound. The beam from the flashlight bounced, filling the shaft with twilight.

"Put a round here," Amos said, putting a daub of muck on the steel. "And here. See if you can get us some fingerholds."

"What if it ricochets?"

"That'll suck."

The first round left a hole in the steel covering maybe a centimeter wide. The second round, a little less. Amos tested the edges with his fingertips. They were sharp, but not knife-sharp. The black rain had soaked the shoulders of his shirt, and the back of it was clinging to his spine.

"Hey, Tiny," he called. "You come down here a minute?"

After a short silence, Konecheck's growl came down. "What'd you call me?"

"Tiny. Just come take a look at this. See if we've got something."

Konecheck landed with a splash, spattering muck on Amos and Rona. That was fine. The prisoner made a big show of flexing his back muscles and stretching out his hands, then stuffed his first two fingers into the bullet holes, braced his other arm against the wall, and pulled. A normal person, it wouldn't have done a damned thing, but the Pit wasn't a place for normal people. The metal flexed, bent, peeled back to show a line of rungs. Curved metal with a little sandpaper texturing for grip. Konecheck grinned, the swelling of his injured face and the jutting beard making him look like something out of a sideshow. His fingertips were red and raw-looking, but as far as Amos could tell, there wasn't any blood.

"All right," Amos said. "It's ugly as hell, but we got a plan. Let's get out of here."

The ladder was narrow and rough, and spending hours hanging off it didn't make sense if they didn't have to do it. Sullivan and Konecheck went up ahead, the guard with his gun to make the fingerholds and the monster to pry away the steel. Amos sat on the concrete floor of the hallway, his legs hanging out into the shaft. Morris and Rona stood behind him with Clarissa between them. Amos' stomach growled. Ten meters up the ladder, the sharp

attack of the gun came once, then again.

"I'm surprised it wasn't harder to find a way out," Clarissa said.

"Thing about prison," Amos said. "It's not like it's supposed to keep you in all on its own, y'know? As long as it slows you down long enough for someone to shoot you, it pretty much did its job."

"You've spent time inside?" Rona asked.

"Nope," Amos said. "I just know people."

Another two aftershocks came and went without knocking anyone off the ladder or collapsing the shaft. An hour later, the Klaxon stopped, the silence as sudden and unnerving as the sounding of the alarm had been. With it gone, there were noises in the distance. Voices raised in anger. Twice, gunshots that weren't from the elevator shaft. Amos didn't know how many people were in the Pit, prisoners and guards and whoever else. Maybe a hundred. Maybe more. The prisoners were in cells, he figured. Locked down. If there were other guards, they were making their own decisions, and no one suggested they go find any of them.

Two more gunshots from the shaft, a murmur of voices, and then a scream. Amos was on his feet almost before Sullivan's body fell past. He landed in the muck at the bottom of the shaft. Rona cried out wordlessly, dropping down to him while Morris turned his flashlight up the ladder. Konecheck's feet were two pale dots, his face a shadow above them.

"He slipped," Konecheck called.

"The hell he did!" Rona shouted. Her gun was in her hand, and she was going for the ladder. Amos jumped down and got in her way, his hands spread wide. "Hey, hey, hey. Don't get crazy here. We need that guy."

"Coming up on level four," Konecheck said. "Starting to see light up top. Hear the wind. Almost there."

Sullivan lay in the muck, his leg folded unnaturally under him, and limp as a rag. He still had the gun in his fist. A yellow indicator on the side said he was out of ammunition. Sullivan had lived just long enough to stop being useful, then Konecheck had murdered him.

Asshole couldn't have waited until they were all the way up.

"He slipped," Amos said. "Shit like that happens. Don't do anything stupid."

Rona's teeth were chattering with rage and fear. Amos smiled and nodded at her because it seemed like the kind of thing people did to

reassure folks. He couldn't tell if it was doing any good.

"Someone going to come help?" Konecheck called. "Or am I doing all this on my own?"

"Take Morris," Clarissa said. "Two guns. One for the metal, one to guard him. It was a mistake. It won't happen twice."

"And leave you unguarded?" Morris said behind her. "Not a chance. No one goes without a guard."

"I'll keep her out of trouble," Amos said, but the guards didn't seem to hear him.

"Everyone up," Rona said. "Everyone. And if anybody does something even a little bit threatening, I swear to God I'll kill all of you."

"I'm a civilian," Amos said.

Rona pointed toward the rungs with her chin. "Get climbing."

So they climbed up into the darkness, hand over hand. Ten meters up, maybe twelve. Morris first, then Clarissa, then Amos, with Rona coming up last, her flashlight stuck in her belt and her gun in her hand. Konecheck wrestled the next length of ladder open, clanging and cursing and roaring in the effort. The black muck kept dripping down from above, making everything slick. Amos wondered if maybe Sullivan really had slipped, and chuckled to himself quietly enough that no one heard him. Konecheck, at the upper end of the ladder, swung to one side, letting Morris pass next to him. Then two more shots and the two men switched places again. Amos wondered if the rungs had been designed to carry the weight of two men at once. But they didn't bend, so that was one good thing. He spent a lot of time looking at Clarissa's ankles, since that was pretty much what there was to look at. They were thin from atrophy, the skin pale and dusty. He noticed when they started to tremble. If her busted hand bothered her, she didn't say so.

"You all right, Peaches?"

"Fine," she said. "Just getting tired is all."

"Hang on, little tomato," he said. "We're almost there."

Above her, the shaft grew shorter. There was no sign of the car or the guards who'd been in it. Just a pale gray square and a growing howl of wind. Once, when they only had four or five meters still to go, Rona below him made a sound like a sob, but only once. He didn't ask her about it.

And then Konecheck was at the edge, hauling himself up with Morris

scrambling after. The black rain was still falling, and it had gotten colder. Clarissa was shaking now, her whole body fluttering like she was too light, and the wind might pick her up and carry her away.

“You can do it, Peaches.”

“I know,” she said. “I know I can.”

She boosted herself up, and then it was Amos’ turn. The elevator shaft ended in a clean break, like the hand of God had come and swept everything away. The intake building was gone apart from shattered concrete and splintered wood strewn across the bare field. The fence was gone. The trees on the horizon had been shaved down to stubble. For as far as he could see, there was just earth and scrub. The sky was dark and low, huge clouds scalloped from one side of the world to the other like inverted waves. The wind barreling down out of the east stank of something he couldn’t quite identify. It was what he imagined the aftermath of a battle looked like. Only worse.

“Come on,” Rona said, pushing at his leg. Then, without warning, Konecheck roared and Morris shrieked. A gun went off as Amos made it up onto the ledge and got his feet under him. Konecheck was holding Morris up off the ground. The guard’s head hung slack and boneless in a way that clarified the situation. Clarissa had collapsed at the gray-haired prisoner’s feet.

For a fraction of a second, Konecheck’s gaze locked with his. Amos saw a base, animal pleasure in the man. The joy of a schoolboy burning ants with his magnifying glass. Faster than anything human, Konecheck dropped the dead guard and surged forward, his feet digging into the slick mud as he ran. Amos stepped into the attack, which wasn’t what the guy had expected, and got a solid punch in under his rib cage. But then Konecheck’s elbow came out of nowhere and hit Amos’ ear hard enough that the world started spinning. Amos stumbled, and the other guy’s grip was on his belt and arm. Amos felt himself lifted up over Konecheck’s head. He looked down the shaft and saw Rona looking up at him wide-eyed and openmouthed. The black was a long way down. Amos wondered if he’d see Lydia again when he got to the bottom. Probably not, but it was pretty as a last thought.

The gunshot made Konecheck stumble and Amos twisted into the slackness of his grip, falling backward and landing hard. Clarissa was lying over Morris’ body, her two hands around the dead man’s fist, taking aim

again. Blood poured down Konecheck's chest, but before he could launch himself at the girl, Rona's hand came up over the edge of the shaft and grabbed his ankle. Konecheck kicked back, his muscles flickering too fast to see, and Rona yelped. But by then Amos was on his feet again, knees bent deep to keep his center of gravity low. The world was still spinning. He couldn't trust his inner ear to tell him which way was up. But he'd spent a lot of years in free fall. Ignoring vertigo just meant it was a day that ended in y.

He landed a straight kick in Konecheck's crotch that probably castrated him, and the man stepped back, eyes wide. He had maybe a tenth of a second to look surprised as he fell back down into the Pit. Then that part was done.

Amos sat down, rubbing his injured ear as Rona crawled up into the bleak half-light. She was crying and turning slowly, taking in the devastation all around them with disbelief and horror. The woman's hands flapped at her sides like she was pretending to be a penguin. Her distress would have been funny if it hadn't been so sincere. Losing everything should at least be dignified.

"Where'd it go?" she shouted over the rushing of the wind, like anyone could answer. And then, "Oh my God. *Esme*."

Clarissa had rolled onto her back, her arms spread to the filthy rain, her head resting on the dead man like he was a pillow. Her eyes were closed, but he could see her rib cage moving. Amos squinted up at Rona. "Esme? That one of your people?"

She nodded without looking at him.

"Yeah," Amos said. "Look, if you need to go look for her, that's all right with me."

"The prisoner... I have to..."

"It's all right. I'll keep Peaches out of trouble. You know. Until you get back."

The absurdity of it seemed lost on the woman. She stumbled forward, heading for a low hill on the horizon. She wasn't coming back. No one was coming back. There wasn't anything to come back to.

Clarissa's eyes were open now. As he watched, her mouth widened into a smile and she reached up, running damp hands through her hair. When she laughed, it sounded like pleasure.

“Wind,” she said. “Oh my God, I never thought I’d feel wind again. I never thought I’d be outside. It’s so beautiful.”

Amos glanced around the ruins and shrugged. “That’s got a lot to do with context, I guess.”

He was hungry and thirsty. Wet. They didn’t have shelter or clothes, and the only gun they had, they’d need to haul around a dead man to shoot. Until his body got cold, anyway.

“Well, fuck,” he said. “Where do we go from here, right?”

Clarissa extended a thin arm, pointing her pale finger to the sky. There, struggling behind the clouds and stratospheric debris, a perfect, pale disk. “Luna,” she said. “Staying on the planet’s going to mean dying when the food runs out. And the water.”

“I was thinking that too.”

“There are yachts. I know where the family kept them. But it’s a spaceport for rich people. Tons of security. We might need help breaking in.”

“I know some people,” Amos said. “I mean, y’know. If they’re still alive.”

“That’s a plan, then,” she said, but didn’t move. Her slur was going away, which meant she probably wasn’t bleeding into her brain. So that was one problem he didn’t have. Amos shifted, lying back on the dead man’s rib cage, the crown of his head touching hers. A little rest seemed like a fine thing, but they’d have to get moving soon. It was a long walk back to Baltimore. He wondered if they could find a car. Or, failing that, a couple of bicycles. His ear was starting to lose its angry throb. He’d probably be able to walk soon.

In the black sky, the pale circle dimmed behind a thicker roil of cloud and ash, then vanished for a moment before struggling back.

“It’s funny,” Clarissa said. “Most of human history, going to the moon was impossible. A dream beyond anyone’s imagination. And then, for a while, it was an adventure. And then it was trivial. *Yesterday*, it was trivial. And now, it’s almost impossible again.”

“Yeah,” Amos said, “well...”

He felt her shift, tuning her head as if to see him better. “What?”

He gestured up toward the sky. “Pretty sure that’s the sun. I get what you’re saying though.”

Chapter Twenty-seven: Alex

His head hurt. His back hurt. He couldn't feel his legs. It was all distressing until his mind came back enough for him to realize it meant he hadn't died. The medical bay chimed, something cool pumped into his arm, and his consciousness faded away again.

When he woke this time, he felt almost human. The medical bay was huge. Easily five times what they had on the *Rocinante*, but smaller than the full, multiunit hospital of the *Behemoth*. The anti-spalling coating on the walls was the soft brown of bread crusts. He tried to sit up, then reconsidered.

"Ah, Mister Kamal. Are you feeling better?"

The doctor was a thin-faced, pale-skinned woman with eyes the color of ice. Her uniform was MCRN. He nodded to her more out of social habit than because he was feeling better.

"Am I going to be okay?" Alex said.

"Depends," she said. "Keep eating like you're twenty, and it'll haunt you."

Alex laughed and a spike of pain cut through his belly. The doctor grimaced and put a hand on his shoulder.

"You did get a little surgery while you were out. That burn you were on made your ulcer way worse."

"I have an ulcer?"

"You used to. Now you have a reconstructed stem graft, but it's still settling into place. Give it a few days, and it'll be much better."

"Yeah," Alex said, resting his head back on the pillow. "I've been under a little stress lately. Is Bobbie okay?"

"She's fine. They've been debriefing her. I imagine they'll want to chat

with you too, now that you're back around."

"What about my ship?"

"We pulled her into the hangar. She's being refueled. You can get her back when we're clear."

That brought him back. "Clear?"

"Those gentlemen who were taking potshots at you? Our escort's back making sure they don't get too happy about following us. Once the relief ships actually get here, I expect you'll be on your way."

"You got some coming, then?"

"Oh my, yes," the doctor said, with a sigh. "Half a dozen of our finest. Probably more than we need, but we're not in a place where anyone wants to take risks."

"I'm right there with 'em on that," Alex said, closing his eyes. The silence felt weird. He opened them again. The doctor stood where she had been before, her smile as it had been, her hands clasped lightly in front of her. There were tears in her eyes.

"Some things happened while you were out," she said. "You should probably know about them."

Bobbie stood up and hugged him hard as soon as he walked into the debriefing room. She wore a flight jumpsuit just like the one they'd provided him. They didn't say anything at first. It felt strange, being enveloped in her arms. She was much larger than him and stronger besides. He would have imagined that being held like that by an attractive woman would have had some erotic element, but all he felt was a deep sense of their shared vulnerability.

He'd never been on Earth. He didn't know it there. Until now, he wouldn't have said he had any particular connection to the place. That he was wrong about that was a revelation. A quarter billion dead between the strikes and the tsunamis. And many more soon. Already the newsfeeds were reporting failures of infrastructure, and surface temperatures were dropping toward freezing in the springtime northern hemisphere under the vast clouds of dust and water and debris. The major cities had fusion reactors for

power, but everywhere that still relied on distributed solar was running out of battery reserves. Billions more lights going dark. The secretary-general was dead, as were an unknown number of assembly representatives. The military was calling back ships from all parts of the solar system, making a cordon around the planet in fear of further strikes. The failed coup on Tycho and the dark fleet that they'd stumbled into, it all felt like a footnote to what had happened to humanity's home world.

And the worst thing was no one knew who'd done it all. Or why.

Bobbie let him go and stepped back. He saw the same hollowness he felt reflected in her eyes.

"Holy shit," he said.

"Yeah."

Everything about the debriefing room expressed safety, comfort. The lights were indirect and shadowless. The walls had the same warm brown as the medical bay. Crash couches surrounded a small, built-in table instead of a desk. It was the kind of space Alex associated with psychiatrists' offices in films. Bobbie looked around too, seeming to see the place anew now that Alex was there. She nodded to a small alcove opposite the door.

"You want some tea? They have tea."

"Sure," Alex said. "Okay. Are you all right?"

"I'm fine. I mean, I'm a little shook, but they didn't put me in the med bay," she said. "What kind do you want? They've got orange pekoe, oolong, chamomile—"

"I don't know what any of those are."

"Me either. So. Okay, you get oolong."

The machine hissed. She handed him a bulb. It felt warm in his hand and had a subtle smell of smoke and water. Alex sat at the table and tried a sip, but it was too hot. Bobbie sat beside him.

"That was some pretty amazing flying," she said. "I'm almost sorry I wasn't there to see it."

"I would have warned you, but, you know. Heat of the moment."

She shook her head. "No objections. If I'd been tensed up, I'd have probably popped open an old wound or stroked out or something. I watched the flight data. Seriously, I was in this room wearing a fresh suit and looking at recordings, and there were still a few seconds there I didn't think we were going to make it."

The admiration in her voice felt warmer than the tea. He was pretty sure he was blushing, and hoped it didn't show. "Yeah, it was a squeaker. Good damned thing you remembered the convoy here too. I wasn't coming up with anything. Do we know who the hell those ships are?"

"No. Most of the escort's pulled off to cover us, and so far it looks like it's working. But no transponder signals from the bad guys. No demands or threats or anything."

"Creepy." The tea had cooled enough now. "Any chance they'll let me send a message back to the captain?"

Bobbie sighed and spread her hands. "Eventually, yeah. They've been treating us like friendlies, but it may be a while before they hand us access to the comm arrays. We're still in a fight, even if we're not at the middle of it."

"What did you tell them?"

Bobbie's brow furrowed. "The truth, only it doesn't come out real well."

"Meaning?"

"I said we were out there looking for missing ships hiding under new transponder signals because of a tip from James Holden."

"Huh. Yeah, that does sound a little ominous when you say it out loud, doesn't it?"

"They wanted to know how he knew to look there, and what my relationship was to Holden. I mean, they kind of knew about you, so it was more about why I was shipping with you."

"What was the answer for that?"

"Old friends, and the fact that you were Navy. You know ships. I'm just a ground-pounder. But that got me into talking about looking at black market issues back at home, and you asking around on Hecate for me and the dead guy and the guys who attacked me."

"So the other dead guys."

"Well, yeah. And after that, it seemed like they were a little suspicious when I said I didn't know anything."

Alex leaned forward. His body still felt weak and shaky. "At least they don't think we're part of... you know. That."

The door opened softly, almost apologetically. The man who came in was older, his hair a well-crafted white. He wore a suit instead of a uniform or jumpsuit. He looked like a particularly avuncular lawyer. Two marines

came in behind him in full armor. They didn't acknowledge Alex or Bobbie, just took positions at either side of the door. The white-haired man beamed at Alex and then Bobbie and then back at Alex again.

"Mr. Kamal!" he said. His voice matched his appearance. "I'm so glad to see that you're up and around. I was hoping to have a word with you about this present unpleasantness, yes?"

Alex shot a glance at Bobbie. Her shrug was almost invisible. This wasn't someone she knew.

"Of course," Alex said. "Anything I can do to help."

"Good, good, good," the man said, then lifted a finger. "But first."

He sat down at the table, and an oddly mild scowl came over his face. Alex felt like they were about to be gently chided by the head of school. "Sergeant Draper, I was wanting to ask you why the government of Earth is demanding to speak with you. Have you been in contact with them?"

Bobbie's face went gray and pale. Her hand went to her mouth. "Oh, I am so sorry," she said. "You look so different on video. I didn't recognize you, sir. Alex, this is Prime Minister Smith."

Alex hopped to his feet. "Oh! I'm sorry, sir. With everything going on out on Ilus and such, I didn't follow the elections last time."

One of the guards coughed in a way that might have hidden laughter. Prime Minister Smith's scowl shifted to something slightly more authentic and nonplussed. He motioned Alex to sit back down. "Yes, well. No harm, of course. But, to the question. Have you been working with the government of Earth?"

"No," Bobbie said. "I've had some conversations and I have a personal familiarity with one person. Chrisjen Avasarala. But that's all."

The prime minister nodded, his brows knitting. "Yes, I see. With the passing of the secretary-general and disarray of the assembly, Chrisjen Avasarala is the de facto legitimate government of Earth. And she has offered to... I believe the phrase was *massage my balls with a paint scraper* if anything happened to you."

"That sounds like her," Alex said.

"Yes, she is quite colorful. And she is also insisting that she be allowed to speak with you. I wonder what exactly it is you would tell her?"

"Nothing I wouldn't say in front of you, sir," Bobbie said. "I'm not a spy. She brought up some questions and concerns that seemed legitimate

and interesting, and I followed up for my own sake. If you'd like, I'd be happy to walk you through everything I did and what I found."

"You are close friends with Chrisjen Avasarala. You are flying with the crew of the *Rocinante*. You seem to have many contacts with Earth and the Belt, Sergeant."

"Yessir," Bobbie said, her gaze forward and slightly down. "Good that we're all on the same side, then."

The silence was longer than Alex liked. The prime minister laced his fingers across his knee. "I suppose it is at that," he said. "So, why don't we all go over what exactly you've found and how we can productively include our mutual friend Chrisjen in all of this."

The debriefing lasted for hours. They had taken him to a separate room, and he'd told them the story of everything that had happened since the return from Ilus. Then another woman had come, and he'd told her. Then they'd brought him back to where Bobbie was, and asked the two of them questions that, by and large, they couldn't answer. All in all, it had been gentle as interrogations went, and even so, it left him drained.

He had quarters of his own that night. A locker, a crash couch, a screen. Even his hand terminal back. The place was a little larger than his bunk on the *Roci*, tiny compared to the quarters on Tycho, and a little bit better than what he'd had back before he'd mustered out of the Navy. They'd even let him record messages for Holden and Amos and Naomi, though they were vetted by the ship's system before being sent out. After that, he promised himself that he'd keep away from the newsfeeds.

It had been years since he'd smelled the air of an MCRN ship. The astringent bite of the air recyclers brought back memories. His first tour, his last one. A sense of growing melancholy stole over him that he didn't recognize at first. Grief. And fear. All his anxieties over the crew of the *Roci* came back a hundred times over. He imagined being back on the ship without Amos. Or without Naomi. Or never seeing his ship again, never hearing Holden's voice. An hour after he'd resolved to go to sleep, he gave up, turned the lights back on, and opened a newsfeed.

Mars was pledging drops of food and emergency supplies. Ganymede, back in control of her own docks, was diverting crops back to Earth. A group calling itself the Acadian Front had claimed responsibility for the attacks, but were discredited almost as soon as they'd made the claim. And on Earth, the riots had begun. Looting. He turned the feed back off and got dressed.

He opened a connection to Bobbie, and she accepted it almost immediately. Wherever she was, it wasn't her bunk. The walls behind her were too far away, and the sound of her voice echoed a little. Her hair was pulled back from her face, her cheeks were flushed, and she was sweating hard.

"Hey," she said, lifting her chin in a sharp nod.

"Hey. Couldn't sleep. Thought I'd see what you were doing."

"Just got done sparring. The lieutenant's going to let me drill some."

"They know you just got shot a little while ago, right?"

"You think a few bullet holes gets you out of training?" she said with a ferocity that left him wondering whether she was joking. "They're even loaning me a suit."

"You been in powered armor since Io?"

"Nope. So that'll be... I don't know. Either really cool or nightmare inducing."

Alex chuckled, and she grinned. Her smile was like pouring water on a burn. "You heading straight for your bunk, or are you stopping by the mess first?"

"I could stand something to eat probably. Meet you there?"

It was an off-time for the mess. The alpha shift's dinner was done, the beta shift's lunch still an hour away. Bobbie was sitting alone at a table by the far wall, her hand terminal open before her. A group of three men and a woman sat not far from her, casting glances at her back and talking among themselves. Alex felt an instant protective surge, like he was back in lower university and one of his friends was being laughed at by another clique.

He grabbed a cheese sandwich and bulb of water, then came and sat across from her. The remains of meatloaf and gravy she'd wolfed down were on her plate and a familiar voice was coming from her terminal.

"—going to be monitoring anything we fucking say. If you wanted to discuss menstruation at great length and detail, this is probably our best

chance. He's always been squeamish about women, and no one likes a Peeping Tom, even if he is prime minister."

"How is she?" Alex asked, nodding toward the hand terminal. Bobbie turned the recording off and frowned at the newly blank screen.

"Heartsick, I think. Devastated. But she'll never let it show. This is what she always feared the most. And now it's happened, and she can't even look away, because she's the one who has to... fix it. Only it can't be fixed, can it?"

"Naw, I guess not."

"They're taking us to Luna."

"I figured as much," Alex said. Something in his voice caught Bobbie's attention.

"You don't want to?"

"Honestly? I want to go home. Get back on the *Roci* with my crew, and after that, I care a whole lot less where we go. Be nice if it was somewhere they weren't shooting at us."

"That would be a plus," Bobbie said. "Don't know where that is."

"Lot of planets out there. My experience with colonies is, ah, a little checkered, but I can see the appeal of a new start."

"There aren't any new starts," Bobbie said. "All the new ones pack the old ones along with them. If we ever really started fresh, it'd mean not having a history anymore. I don't know how to do that."

"Still, I can dream."

"Right there with you."

At the other table, two of the men rose, carrying their trays to the recycler. The man and woman who stayed glanced over at Alex and Bobbie, and then pretended they hadn't. Alex took a bite of his sandwich. The greasy cheese and fake butter were like being young again. Or else like remembering how long it had been since he was young.

"Any word on the assholes who shot at us?"

"They're still fighting with the escort ships. Withdrawing, but not retreating. The escort isn't looking to engage as long as they can keep the bastards from getting close to us."

"Yeah, all right."

"Seem weird to you too?"

"Little bit," Alex said. "Seems like a pretty piss-poor ambush if you

don't actually ambush anyone."

"It's because of us," Bobbie said. "You and me. We were in the right place at the right time. We forced the bad guys to make their play too soon. If we hadn't, it wouldn't be just the secretary-general that died. Honestly, I think that's why we're getting treated this well. Smith knows it could have gone a lot worse without us."

"You're probably right. It's just..."

"You're waiting for the other shoe to drop."

"Yeah."

"Me too. We're jumpy. Why wouldn't we be? Someone just broke pretty much all of human civilization overnight."

The words hit Alex like a blow. He put down his sandwich. "They did, didn't they? I don't know who we are now. I don't know what this does."

"Me neither. Or anyone else. But we'll figure it out. And whoever did this, we'll find them. We're not going to let them win."

"No matter what game they're playing."

"No matter what," Bobbie agreed.

Billions were dying right now, and no way to save them. Earth was broken, and even if it survived, it would never go back to what it had been. Mars was a ghost town, the terraforming project at its heart falling to pieces. The aliens that sent the protomolecule hadn't needed to destroy humanity. They'd given humans the opportunity to destroy themselves, and as a species, they'd leaped on it. Alex pushed away an angry tear, and Bobbie pretended she hadn't seen it.

"Yeah," he said. "Still. I'm going to feel a lot better when the relief ships get here."

"Amen," Bobbie said. "Still, I wish it was more than just six ships coming. Well, seven. Six and a half."

"Six and a half?"

"Relief ships picked up a commercial hauler somewhere. Nonmilitary. It's called the *Chetzemoka*?"

Chapter Twenty-eight: Holden

Cover for some kind of theft,’ ” Holden said again. “I mean what the hell was that?”

Fred Johnson kept walking. The gently curving corridor with its view of the construction sphere was like Tycho Station’s boast that it had not been destroyed. The people they passed nodded to Fred and Holden. Some wore green armbands in solidarity, and more than a few of those had the OPA split circle with an additional split at ninety degrees to the first. Others had a stylized globe and the words ONE PEOPLE OPA & EARTH. The physical damage to the station was for the most part limited to the engineering and drive levels at the bottom of the sphere and Fred’s office on the ring, but Holden couldn’t help feeling that the deeper injury was to Tycho’s story about itself. Not long ago, Tycho—like Ceres—had been one of the jewels of the outer planets. Part of a greater argument about the independence of the Belt.

Now that Belters had attacked it, it had become something else. The sense of unity with Earth wasn’t so much a real sympathy for the government that had so recently been the enemy, than a statement of separation from the OPA. Tycho Station for Tycho Station, and fuck anyone who crossed them.

Or he may have been projecting, since he was feeling more than a little like that himself.

“She was being a journalist,” Fred said. “That kind of thing? It’s what they do.”

“We just saved her life. If it wasn’t for us, she’d have been carried off the station to God knows where and... I don’t know. Tortured or something.”

“That’s true,” Fred said. They reached the lift, passing through doors that opened in anticipation of them. Fred’s rank still had its privileges, and first priority on lifts was one. “But we also lied to her. And she knew it.”

Holden bit back an objection because it wasn’t much more than *We did not* and he knew that actually they did. It wasn’t something he’d have done, just a few years before. Then, he’d have told the truth, the whole truth, and let the chips fall wherever they fell. He didn’t know if it bothered him more that he’d changed or that he hadn’t noticed it until someone else pointed it out.

Fred looked over to him with a weary smile. “ ‘Be angry at the sun for setting if these things anger you.’ A poet named Jeffers said that.”

“Yeah, but was he talking about journalists and politicians lying to each other?”

“Matter of fact, he was.”

The lift shifted and dropped. Fred leaned against the back wall with a groan.

“We didn’t have to do that,” Holden said.

“Yes we did,” Fred said. “After a loss, the most important thing for a leader to do is be seen. And be seen walking under their own damned power. Sets the narrative.”

“Still.”

“It’s something I can still do,” Fred said. “I’m sure as hell going to do it.”

Fred’s old office was still being repaired. Until its walls and floor didn’t open on vacuum, Drummer had set up a space for him near the overfull brig. It was a smaller space, less comfortable and less imposing. Holden couldn’t be in it without feeling like Fred had given himself a demotion. Or had accepted without complaint the one the universe had handed to him.

Fred settled in behind his desk and rubbed his eyes with the palms of his hands. “The truth is that almost everything we do here won’t even be a footnote in the history books.”

“You don’t know that. You’re just feeling discouraged,” Holden said, but Fred was already pulling up his work on the desk monitor.

“I had two messages last night. Well, more than that, but two that were interesting. The first was from Earth. Avasarala was on Luna when it happened, and she’s putting together a response.”

“A response?”

“A diplomatic conference. The Martian prime minister was already en route. She wants me to be there too. To ‘represent the slightly less batshit wing of the OPA.’ If humanity really rests on that woman’s diplomatic skills... well, that’ll be interesting.”

“What’s the worst that could happen? War?”

Fred coughed out a grim laugh. “I’ve already talked with Drummer. She’s ready to take over operation of Tycho in my absence.”

“You’re going to go, then?”

“I don’t know if I’ll go there, but I won’t stay here. There’s something else I wanted you to see.”

Fred opened a message, and gestured Holden toward it. A pale-skinned man with close-cut white hair and the wrinkles of early age competing with acne scars of long-past youth. The date stamp at the lower left corner said it had been sent from Pallas Station.

“Anderson Dawes,” Fred said. “You’ve heard of him?”

“Big mover and shaker in the OPA, isn’t he?”

“The man who reached out to me, back in the day. Made me into the inward-facing figurehead of the Belt. Instrumental in the transition of Ceres to OPA oversight. The last few years, he’s been negotiating for the OPA to have a stake in Ganymede equal to Earth and Mars.”

“All right,” Holden said.

Fred started the recording, and the man came to life. His voice was gravelly and low, like he’d been punched in the throat too many times. “Fred. I know this has got to be a hard time for you. For what it’s worth, it’s pretty shocking to all of us. But so it goes. History’s made of surprises that seem obvious in retrospect. I want you to know, I didn’t sanction any of this. But I know the men who did, and say what you will about their methods, they’re true patriots.”

“What the fuck is this?” Holden said.

“Wait for it,” Fred said.

“I’m reaching out to you now to make peace within the organization. I know as well as you do how much you’ve sacrificed and how hard you’ve worked for the OPA over the years. It’s not forgotten. But we’re in a new age now, and it carries its own logic. I know you’re enough of a man to recognize the difference between justice and the things that have to happen.

I'll get you back in the fold. I swear to that. But I'm going to need a token. Something I can take to the new powers to show that you're a reasonable man. That you can negotiate. You've taken a prisoner. Not one of the people who participated in the insurrection. Even they know asking *that* so soon is a bridge too far. But a prisoner of yours nonetheless. His name's William Sakai. As a gesture of good faith, I'm asking that you turn him over to me at Pallas Station, in return for which I will guarantee you a seat at the table when—"

Fred stopped the recording, Anderson Dawes caught with his eyes and mouth half-open.

"You have got to be kidding me," Holden said.

"No one's laughing."

Holden sat down on the edge of the desk, staring at the frozen man, his chest a welter of conflicting emotions: anger, surprise, outrage, amusement, despair. "You could tell him we already threw him out an airlock."

"Would that be before or after we threw him out an airlock?"

"Either way works for me."

Fred smiled and shut down the display. "You say that, but you wouldn't do it. Even angry, you're too decent a man. And it turns out I am too."

"Really?"

"I got soft when I got old. Everything seems... delicate to me now. We're still under lockdown, and I have to open that up. Have to get some semblance of normalcy. That's not the point, though. I have invitations to two tables. The inner planets are in retreat. They're regrouping. The radicals within the OPA are becoming the new leadership."

"But they're crazy mass murderers."

"Yes," Fred said. "And we don't know who they are. Dawes does. I don't."

"Wait a minute," Holden said. "Hold on. Are you about to propose that you trade Sakai to this Dawes guy so that you can feed the names of whoever's behind dropping rocks on Earth to Avasarala? How many times are you looking to change sides in one career?"

"I never changed sides," Fred said. "The sides keep changing around me. I was always the one who wanted order. Peace. Justice, even. What happened at Anderson Station opened my eyes to things I hadn't seen. Or had chosen not to see. Now this..."

“It’s done the same thing again.”

“I don’t know what it’s done. That’s what I’m trying to decide. There have always been radicals within the OPA. The Voltaire Collective. Marco Inaros. Cassandra Lec. But they were on the margins, where we thought we could control them. Keep them in line, or if not always that, use their excesses to make the mainstream places like Ceres and Tycho seem the least of the available evils. Now, they’re in charge. I don’t know if the best thing is to declare against them or stand beside them and try to control the fall.” He shook his head.

“Your friend Dawes seems to be in bed with them already.”

“His loyalty’s to the Belt. When the best thing was to find a way to be respected as an equal by the inner planets, that was what he aimed for. My loyalty is to... everyone. There was a long time that meant speaking for the people who had the least voice. Then the protomolecule came and changed the game, and now, if riding beside the radicals gives me the most influence... As long as my people hold Medina, no one can ignore me. I can throw in on whichever side I think it will do the most good to be on, in the long-term.”

“That sounds like post hoc realpolitik rationalizing bullshit,” Holden said. And then a moment later, “Sir.”

“It is,” Fred said. “But it’s what I’ve got to work with. If I commission the *Rocinante* to take me to Luna and the meeting with Avasarala, will you accept the job?”

“If we finish checking all of Sakai’s work and you bring your own crew, sure. Or, better, we go pick up mine from wherever they’ve gotten to.”

“And if I hire you to take me and the prisoner to Pallas?”

“Then you can go fuck yourself.”

Fred chuckled and stood up, checking his sidearm. “I do always enjoy our little chats, Captain. Take the day off. I’ll get back to you when I’ve made a decision. Either way.”

“Where are you going now?”

“To talk with Sakai,” Fred said. “See if there’s anything about this I can glean from him. The prospect of not getting thrown out one of my airlocks might make him more willing to talk with me.” He looked at Holden, and his expression shifted to a strange place at the friction point between pitying and pleading. “I try to do the right thing, Holden. But there are times when

it's not obvious what that is."

"I agree with you," Holden said. "Right up to the part where you tell me this is one of those times."

Holden was in a Thai restaurant eating peanut curry that was, as far as he could remember from his childhood on Earth, totally unlike anything served on a planet's surface. A piece of not-chicken floated on top of the not-curry, and Holden was pushing it under with a chopstick and watching it pop back to the surface when two messages came through. The first was from Mother Elise. The family was all right so far. They were under an environmental watch, but no evacuation orders had come. Not, she said with one lifted eyebrow, that there was anyplace to evacuate to better prepared and equipped than the ranch. They were sending the spare reactor down to help with the local grid at Three Forks, and waiting to hear from the Jacksons to see if they needed anything. He knew her well enough to see the depth of anxiety in all the things she didn't say. But when she said goodbye, she promised to be in touch. It was thin comfort, but it was something.

The second message was from Alex.

Bobbie Draper and he were on the prime minister's ship and burning for Luna with the escort fleet watching their backs. Everyone was pretty freaked-out, but he thought they were okay for the time being. The relief ships were on their way and due in a day or two. He hadn't had any word from Naomi, wherever she was. Or, more to the point, from Amos. He made a joke about Amos surviving anything, and how this wasn't the first planet that had blown up on him, but the humor carried the same dread and fear that Holden felt. When Alex signed off, he replayed the whole message from the start three more times, just to hear the familiar voice.

He started to record a response, but the restaurant was too open and too public for the things he wanted to say, so he promised himself he'd get to it when he was back in his quarters. He finished as much of the curry as he could stomach and the restaurant light slowly shifted from yellow to gold, the colors of a false sunset on a planet many of the people there had never seen except on screens. He paid the check and the waiter came, offering a

variety of after-dinner desserts or drinks. The man's gaze lingered long enough that, while it was all within the bounds of politeness, it was pretty clear that Holden could have asked for some other things too.

Holden's mind shifted on most of the questions. More food, more drink, more sleep, more sex. Any sex. He was aware of a deep and oceanic cavern of want in his belly. Something that was like hunger or thirst, exhaustion or lust, but that wouldn't be satisfied. He didn't have words for it, except that it left him quick to anger and despair. Lingering behind it all, the fear that he wouldn't ever have his crew back on his ship made him feel gut-punched.

And then the word for it came. He was *homesick*, and the *Rocinante*, wonderful as she was, wasn't home unless Alex and Amos and Naomi were in her. He wondered how long the feeling would last if they never came back. How long he'd wait for them, even once he knew they wouldn't return. The waiter smiled gently down at him.

"Nothing," Holden said. "Thanks."

He walked out to the main corridor, mentally rehearsing what he'd say to Alex and how he'd say it. Anything he said was going to be examined by the Martian communications service, so he didn't want to put anything in it that was open to misinterpretation. The problem with that being that he always knew what he meant by things, and didn't see the other readings until someone made them. Maybe he could just make a few jokes and say that he was ready to have everyone back together.

When his hand terminal buzzed a connection request, he accepted it, his mind primed to expect Alex even though light delay made that impossible. Drummer scowled out at him from the screen. "Mister Holden, I was wondering if you could stop by the auxiliary security office."

"I guess," Holden said, suddenly wary. He still half expected Drummer to turn out to be playing some angle of her own. "Is it something I should know about now?"

A stream of cursing came from the background, growing louder. Drummer stepped aside and Fred lurched into the screen. "If we were talking about it on the network, you wouldn't be coming in here."

"Right," Holden said. "On my way."

In the security office, Fred was pacing, his hands clasped behind his back, when Holden arrived. He nodded sharply by way of greeting.

Drummer, at her seat, was a model of the crisp professionalism designed to offer no reason for the boss to yell at you. That was fine. Holden didn't mind being the one who got yelled at.

"What's the matter?"

"Medina went dark," Fred said. "She was supposed to report in this morning, but with everything being at loose ends, I didn't worry. She's missed two opportunities since then. And... Drummer? Show him."

The security chief pulled up a schematic of the solar system. At scale, even Jupiter and the sun were hardly more than a bright pixel. Thousands of dots showed the traffic in-system. Ships and bases, satellites and probes and navigation buoys. All of humanity in a nutshell. With a motion and a syllable, most of the clutter vanished. In its place, a couple dozen green dots with the word UNDETERMINED where the identification codes should be made a rough cloud. Someone's statistics run with a small but significant correlation.

"As soon as the station went dark," Drummer said, "we saw these. Twenty-five new plumes. All of them have drive signatures that match Martian military ships, and all of them are under heavy burn for the Ring."

"Heavy burn?"

"Eight to ten g to start, curving down, which means they're running at the limit of their drives."

Holden whistled. Fred stopped in his pacing, his expression placid in a way that spoke volumes about rage. "Those are my people on Medina. If the station has been compromised, or if these new ships are on their way to do something violent there, it will pose a significant obstacle to my participation with the new direction within the OPA."

"Meaning fuck that noise?"

"Yes."

"It's a long way out to Medina," Holden said. "Even at those burns, it'll take them a while. But I don't think we could beat them there."

"We couldn't do anything if we did. If I took all the ships at my disposal, one Martian frigate could still rain hell on them. And even the *Rocinante* would be badly outgunned."

"Have to wonder where they got Martian military ships," Holden said.

"I'll be sure to ask Dawes about that as soon as I've told him what I

think of his good faith prisoner exchange. How long before the *Rocinante*'s ready to fly?"

"Put a rush on it, we could be out of here in five days."

"Mister Drummer, please put all available teams on finishing the repairs and security audit for the *Rocinante*."

"Yes, sir," Drummer said, and shifted her screen to show the work schedules for the construction drum. Fred looked down at his feet and then back up.

"I'm going to be busy the next few days putting Tycho in order for Drummer. I'd like you to oversee the crews on the *Roci*."

"Wasn't going to do anything else."

"Fair enough," Fred said. And then, almost wistfully, "It will be good to see Luna again."

Holden tried to wait until he got back to his quarters, but lost patience when he reached the lift. He opened Alex's message and set up the camera to record his reply.

"Hey, Alex. So, funny thing. Looks like I'm going to be catching up with you sooner than we'd thought..."

Chapter Twenty-nine: Naomi

She'd known to expect it. Like falling back into a bad habit, the dark thoughts came: which conduits had power lines in them with enough voltage to stop a heart, which rooms were small enough to seal and evacuate, the ways the medical bays could be tricked into administering an overdose. And the airlocks. Always the airlocks. The ideas weren't compulsions, not yet. They were just her brain noticing things that interested her. The worst would come later. If she let it.

So instead, she distracted herself. Not with the newsfeeds that played constantly, everywhere. Those only made her feel more helpless. Not with the conversations with her old friends. At best, those left her feeling like she was lying. At worst, like she was becoming an earlier version of herself for whom the dark thoughts were more natural. What she did have was work. It was all simple tasks like checking inventories and swapping air filters, and always under the watchful eyes of a minder. When she did talk, it was polite and superfluous; the kind of banter anyone crewing the same ship would make. It gave the rest of the crew the illusion that she was one of them in a way that sulking in her bunk wouldn't have. If she had any hope at all, it came from finding a way to leverage her weird non-status with the group. And with Marco.

At first, she'd tried distracting herself by thinking of her real crew. Alex and Amos. Jim. Even her best memories of them were riddled with guilt and pain now, so instead she filled her mind with technical concerns. In the mess, while the others cheered at the images of devastation, she speculated about the reactor's output, starting with the size of the galley, and then guessing at the requirements of the air and water recycling systems, and knowing the rough percentage that the *Roci* put into them. During her sleep

shift, as she lay restless in her crash couch, the steady one-third-g burn pressing her into the gel like a hand on her chest, she ran over the power grid from the *Roci*, mapping how the logic of her ship would apply to this one. She thought of it as a meditation because it was too dangerous to admit—even to herself—that she was planning.

And still, small things came together. A toolbox in the machine shop had a bent hasp and, given a few minutes, could be forced open. The Allen wrenches inside would open the access panel on the lift wall between the crew quarters and the airlock, which was where the secondary diagnostic handset for the comm array was stored. With a few uninterrupted minutes, someone could probably broadcast a message. A short one. If there was anything to say, or anyone to say it to.

She had half a dozen schemes like it. A path to sneak between the hulls and take control of a PDC. A way to use a stolen hand terminal to make copies of the engineering software. How to force-cycle an airlock by spoofing the emergency codes from the medical bay. Most of them were fantasies, possible in theory but nothing she had ever had reason to try. A few were fairly solid. And all of them were defeated by a simple, inescapable fact: the first layer of any security was always physical. Even if she'd found a way to take control of the whole ship using a magnet and a length of Velcro, it wouldn't matter, because Cyn or Aaman or Bastien would put a bullet through her neck before she could manage it.

So she called it meditation and kept the darkness at bay. And sometimes—by being quiet and not making waves and keeping her mind and senses sharp—she heard something she wasn't supposed to hear.

Karal, her minder that shift, was talking up a woman called Sárta while Naomi scraped the crew decking nearby. Truth was the ship was new enough it didn't need it, but it was work. Wings, who'd first hunted her back on Ceres, came out from his quarters in a Martian naval uniform. Naomi looked up from under her hair as Wings saw Karal and Sárta standing together. The flicker of jealousy that passed over him had been the same since humans came down from the trees.

"Hey, y'all," Wings said in a fake drawl. "Vise mé! Bin Marteño, sa sa? Howdy, howdy, howdy!"

Karal chuckled and Sárta looked annoyed. Wings stepped through the narrow hall with an affected bowlegged gait. Naomi shifted aside to give

him room.

“You got nothing better to do than play dress up?” Sárta asked.

“Don’t wait underwater,” Karal said. “Heard we’re taking prisoners first. Liano, he ran whispers to Ceres. Tightbeam. Hamechie about the prisoners.”

“Not how I heard it,” Wings said, too quickly and more to Sárta than Karal. “I heard it’s only one. Sakai. And even that...” He shrugged.

“Even that?” Sárta said, and mimicked the shrug. Wings blushed in anger.

“Everyone knows how it is,” Wings said. “Sometimes they tell dead men they’ll live. Karal, you were there. Andrew and Chuchu? All about how help’s coming and then so sorry, so sad?”

“Esa died soldiers,” Karal said, but the point hit home. It was in his hands and the corners of his mouth. And then, like he realized his mistake, he looked over to Naomi. She kept her expression blank and bored, her attention on the seam in the deck and the thin plastic spatula she was dragging through it. The cascade of implications couldn’t reach her face.

Sakai had been the name of the new chief engineer on Tycho, and if this was the same man, he’d been one of Marco’s. And he’d been caught, or they wouldn’t have called him a prisoner. She blew the hair up out of her eyes, shifted over to a new seam and started again.

“Back to work, yeah?” Karal said.

Wings grunted his derision, but went back to his quarters to do as he’d been told. Karal and Sárta went back to flirting, but the moment was gone, and pretty soon it was only Karal and Naomi again, passing time.

While she worked, pressing the plastic into the seams, scraping out whatever had gathered there, doing it again, she tried to fit the new information into the larger scheme of things. Marco had hoped she would bring the *Rocinante* to Ceres. But Sakai had known that the ship needed repair, and must have passed that information up to leadership.

She’d thought that Marco had wanted her ship because of who and what *she* was. And maybe that was part of it. Or maybe what he’d really wanted was private access to a ship that would be expected and welcome at Tycho Station. For what, she didn’t know. The way he nested plans inside his plans, he might have had half a dozen uses for the *Roci* and for her. And more, there was a question about whether Sakai was in danger. Were they

afraid Fred would execute him? Maybe. Maybe something else.

Either way, she knew more now than she'd known before, and, like the bent hasp on the toolbox, it gave her options she hadn't had. She wondered what Jim or Amos or Alex would have done in her place, how they would have taken this one piece of information and used it. An academic question, really, because she knew what Naomi Nagata would do, and it wasn't something any of them could have done.

When the deck was clean, she dropped the spatula into the recycler, stood, and stretched. The thrust gravity made her knees and spine ache, and she wished that wherever they were going, they'd be in a little less of a hurry to get there. It didn't matter.

"Grabbing a shower, me," she said. "Tell him I want to talk."

"Him who?" Karal said.

Naomi hoisted an eyebrow. "Tell him the mother of his son wants to talk."

"You've put him in the field?" Naomi said. "Is that where we are? Child soldiers?"

Marco's smile looked almost sorrowful. "You think he's a child?"

The exercise machines were empty apart from him. On the float, everyone in the crew would have been spending hours in the resistance gel or strapped into one of the mechs. On the burn, most of the crew were getting more than enough from their own weight. But Marco was there in a sheer exercise gown, straps wrapped around his hands, pulling down on wide bands that fought against him. The muscles in his back rippled with every stroke, and Naomi was certain he was aware of it. She had known many strong people in her life. She could tell the difference between the muscles that grew from work and the kind that came from vanity.

"I think he's crowing about how he's responsible for the rock fall on Earth," she said. "Like it's something to be proud of."

"It is. It's more than you or I could have done at his age. Filip's smart and he's a leader. Give him another twenty years, he could run the solar system. Maybe more."

Naomi walked over and turned off the exercise sequence. The wide bands in Marco's hands went slack with a barely audible hiss. "I wasn't done," he said.

"Tell me that isn't why you brought me here," she said. "Tell me that you didn't abduct me in order to show me what a good father you've been and how well our boy turned out. Because you betrayed him."

Marco's laugh was low and warm and rolling. He started unwrapping his hands. It would have been so easy to hurt him while he did it that she was fairly certain he had a hidden way to defend himself. And if not, the impression that he might was defense enough. She wasn't here to kill him. She was here to push him into saying something.

"Is that what you think?" he asked.

"No," she said. "I think you did it to show off. I walked away from you, and you're such a little boy that you still can't stand it. So when your big moment came, you had to have me here to see it happen."

It was true, as far as it went. She did see a pleasure in him that came from having power over her. Even her weird half-status in the crew was a part of that. Locking her in a cage would have been a tacit admission she was a threat. He wanted her to see that she was powerless, to make the prison walls herself. There had been a time it would have worked. She was betting that he didn't realize that time had passed.

And she was betting that it had passed. When he narrowed his eyes at her, shaking his head, she still felt the tug of humiliation in her throat, familiar as an old habit. So perhaps the truth was more complicated.

"I brought you home to the winning side because you are the mother of my son, and always will be. Anything beyond that is happy coincidence. That we have the chance to find some sense of closure between us—"

"Bullshit. Closure? You lost. It's closed. You only say it wasn't finished because you hadn't won yet. I left. I sacrificed everything because having nothing away from you was better than having it all and being your puppet."

He lifted his hands, palms out, in a mocking gesture of peace. It wasn't working. Not yet.

"I hear that you would have done things differently. I don't blame you for that. Not everyone has the strength to be a soldier. I thought you did. I thought I could count on you. And when the burden bore you down, yes, I

took our son someplace I knew he'd be safe. You blame me for keeping him away from you. But you'd have done exactly the same to me, if you'd had the power."

"I would have," she said. "I'd have taken him with me, and you'd never have seen either of us again."

"So how different are we?" Sweat dewed his skin. He took a towel from the rack, dabbing at his face and arms. She knew intellectually that he was beautiful, the way the iridescent wings of a carrion fly would be. She felt the weight of her disgust with herself for letting this man be what he was to her, and knew that was part of what he intended. The dark thoughts stirred in her brain stem. They didn't matter. She was here to solve a puzzle.

He put down the towel. "Naomi—"

"It's Holden then, isn't it? You brought me here as... what? Insurance against him?"

"I'm not afraid of your Earther fuck buddy," Marco said, and Naomi heard the roughness in his voice like an animal scenting a distant fire.

"I think you are," she said. "I think you wanted him off the board before you started this, and I was supposed to lead him into the trap. Because you couldn't imagine that I would come alone. That I wouldn't bring a man to be strong for me."

Marco chuckled, but it had more of an edge to it. He walked across the exercise mat, scooping up his dark robe and shrugging into it. "You're trying to talk yourself into something, Knuckles."

"Do you know why I'm with him?"

If Marco were wise, he wouldn't rise to that bait. He'd walk out, leave her alone among the machines. If she'd managed to make him angry, even just a little bit angry, though...

"I assume you have a kink for powerful men," Marco said.

"Because he *is* what you *pretend* to be."

She saw it land. She couldn't even say what it was that changed in him, but the Marco she'd seen since being brought here—the smooth, world-weary, self-assured leader of the greatest coup in human history—was gone, dropped like a mask. In his place was the rage-filled boy who'd almost destroyed her once. His laugh wasn't low or warm or rolling.

"Well, just wait around, and we'll see how much that does for him. Big Man Holden may think he's unkillable, but everyone bleeds."

There. That was a datapoint. It was working. It might only have been the rhetoric of the squabble, an empty threat. Or he might have just told her that his plans still involved the *Rocinante*.

“You can’t do anything to him,” she said.

“No?” Marco said, his teeth bared like a chimp. “Well, maybe you will.”

He turned sharply, stalking out of the room. Leaving her alone the way he should have a few minutes earlier. Or else a decade and a half before.

“You done?” Cyn asked, nodding at the brick of lentil and rice half-eaten on her plate. On the screen in the mess hall, a Martian general was pounding a table, red-faced with passion that looked a lot like fear. He was describing the cowardice of the person or persons who had committed this atrocity against not only Earth, but humanity. Every third sentence or so, someone at the end of her table would repeat the general’s words in a high, quacking voice, like something from a children’s cartoon.

She broke off another piece of the lentil brick and popped it in her mouth. “Close enough,” she said around it. She put her tray and the rest of the brick into the recycler and walked back toward the lift. Cyn loomed behind her. She was so locked in her own thoughts that she barely noticed he was there until he spoke.

“Heard you had it out with el jefe,” Cyn said. “Etwas á Filipito?”

Naomi made a noncommittal sound in the back of her throat.

Cyn scratched at the scar behind his left ear. “Es un bon coyo, your son. I know this is none of what you’d pick, but... Filipito, he heard too. Took it hard.”

The lift stopped and she got out, Cyn close behind. “Took it hard?”

“No weight,” Cyn said. “Only know it. A man, our Filipito, but not so much he don’t want your opinion, yeah? You’re his mother.”

The heartbreaking thing was that she understood. She only nodded.

In her bunk, her fingers laced behind her neck, she stared up at the blackness on the ceiling. The interface screen at her side was dead. She didn’t miss it. Slowly, she put together what she knew.

Marco had made attempts on the lives of the heads of Earth, Mars, and

the OPA, but only managed to kill the UN secretary-general. He had tried to get the *Rocinante* before any of those attempts were made. He'd unleashed the worst catastrophe on Earth since the dinosaurs went extinct. He had Martian warships and weapons but didn't show any signs of cooperating with the Martian government or Navy. All things she'd known, nothing new. So what was new?

Three new things, and maybe only that. First, Wings thought the attempts to trade Sakai back might be more to reassure the prisoner than to actually retrieve him. Second, Marco had intimated that Holden was still in danger, and third, that *she* might be the one to hurt him.

And also, underlying everything, her certainty that until Marco had given his speech, made himself the focus of all humanity's attention, the attack was still only half-done. And if Sakai thought he was going to remain a prisoner, it would go wrong. That was interesting. What could Sakai know

Oh.

Fred Johnson was alive, and Tycho Station wasn't in Marco's hands. Holden was in danger. She would be the one that hurt him.

So that meant that the *Roci*, like the *Augustín Gamarra* before her, had been rigged to have her magnetic bottle fail. Probably in dock. Fred Johnson, James Holden, and incidentally Chief Engineer Sakai and everyone on the station—all of them would die in a fireball whenever the software she'd written a lifetime ago decided that they should.

It was all happening again, and she had no way to stop it.

Chapter Thirty: Amos

They moved on foot. The clouds weren't really clouds, and the rain that spat down at them was as much grit and soot as water. The stink of turned earth and rot was all around them, but the cold pushed it back to where it mostly just smelled cold. From the way the trees were all knocked down in the same direction—leaves roughly northeast, roots pointing southwest—he hoped they'd be heading toward less devastated territory. At least until they got near the coast and the flooding.

In Baltimore, he figured the folks in the least trouble would be in the failed arcology in the middle of the city. It had been designed to hold a whole ecosystem inside its massive steel-and-ceramic walls. That it hadn't worked for shit didn't matter as much as the fact that it had been built tall and designed to last. Even if the bottom few floors went underwater, there'd be plenty of people near the top who rode out the worst of it. When Baltimore was a sea, the arcology would still be an island.

Plus, the arcology was a shit neighborhood. Erich and his thugs owned at least some of it. And so long as the rest wasn't controlled by one of the major players—Loca Griega or Golden Bough—they could probably take it in a determined push. And even if Erich hadn't made it, there'd be someone there to negotiate with. He just hoped it wasn't Golden Bough. Those guys, in his experience, were fucking assholes.

In the meantime, though, there were more immediate problems. Getting there was the goal, and if the idea was to put one foot in front of the other from the Pit in Bethlehem to the arcology in Baltimore, there were some holes in the plan. The expanded district put about three million people between him and where he was going if he took the straightest path. High-density urban centers seemed like a bad idea. He was hoping that they could

stay a little to the west of that and make their way around. He was pretty sure there was conservancy zone there they could trek along. Not that he'd spent much of his time on Earth camping. But it was what he had to go with. He probably could have done it, if he'd been by himself.

"How're we holding together, Peaches?"

Clarissa nodded. Her prison hospital gown was mud-streaked from shoulder to hem, and her hair hung long and lank. She was just too fucking skinny and pale. It made her look like a ghost. "I'm fine," she said. Which was bullshit, but what was he going to do about it? Stupid to have asked in the first place.

So they walked, tried to conserve energy, looked for places that might have fresh water. There were a couple emergency stations set up by the highway, men and women with medical armbands and generators to run the lights. It never got more than low twilight, even at noon. The clouds kept some of the heat from radiating out into space, but they blocked the sun too. It felt like early winter, and it should have been summer hot. Every now and then, they came across some new ruin: a gutted building, the walls blown off the steel and ceramic girders, a high-speed train on its side like a dead caterpillar. The bodies they found on the roadside looked like they'd gone in the initial blast.

Most of the dead-eyed, shell-shocked refugees on the roads seemed to be heading for the stations, but Amos tried to steer away from them. For one thing, Peaches was pretty clearly not supposed to be walking free among the law-abiding citizens of Earth, and Amos didn't really feel like having any long conversations about what laws still applied, post-apocalypse. And anyway, the stuff they really needed they couldn't get there. So he kept his eyes open and headed northeast.

Still, it was three days before he found what he was looking for.

The tent was back off the road about seven meters. It wasn't a real tent so much as a tarp strung over a line between a power station pole and a pale sapling. There was a fire outside it though, with a man hunched over it feeding twigs and sticks into the smoky flames. An electric motorcycle

leaned against the power station pole, its display dark either because it was conserving power or it was dead. Amos walked over, making sure his hands were always where the other guy could see them, and stopped about four meters away. Peaches stumbled along at his side. He figured that to anyone who didn't know her or who she was, she probably didn't look real threatening.

"Hey there," Amos said.

After a long moment, the other guy nodded. "Hey."

"Which way you heading?" Amos asked.

"West," the guy said. "Everything's fucked east from here to the coast. Maybe south too. See if I can get someplace warm."

"Yeah, things are shit all over," Amos said like they were at a coffee kiosk and chatting about the weather. "We're heading northeast. Baltimore area."

"Whatever's left of it," the guy said. "No offense, but I think your plan sucks."

"That's okay. I was thinking the same about yours."

The man smiled and didn't go for a gun. If he had one. Not so many guns among the law-abiding Earth populace as there were in the Belt. And if the guy was willing to just shoot the shit this long without anyone escalating or making a play, probably he wasn't a predator. Just another accountant or medical technician still figuring out how little his degree was worth now.

"I'd offer to share," Amos said, "but we ain't got shit."

"I'd help, but the tent's only big enough for one."

"I'm small," Peaches joked, but only sort of. Skinny as she was, she had to be feeling the cold worse, and when he paid attention to it, Amos had to agree it was getting pretty damn brisk.

"Word of warning? Head north a few clicks before you cut any farther east," the man said.

"Why?" Amos asked.

"Militia motherfucker. NO TRESPASSING signs and everything. Took a potshot at me when I went to ask for some water. Kind of asshole that's probably pissing himself with glee that the world went to shit and made his stashed guns and paranoia pay off."

Amos felt something in his chest go loose and warm and thought it might have been relief. "Good to know. Take care then."

"Peace be with you."

"And also with you," Peaches said. Amos nodded and turned north, trudging back along the road. About half a klick later, he stopped, squatting down by a tree, and watched the path they'd just walked down. Peaches huddled beside him, shivering.

"What are we doing?"

"Seeing if he follows us," Amos said. "You know. In case."

"You think he will?"

Amos shrugged. "Don't know. Thing about civilization, it's what keeps people civil. You get rid of one, you can't count on the other."

She smiled. She really wasn't looking that good. He wondered in passing what he'd do if she died. Figure something else out, probably. "You sound like you've done this before," she said.

"Shit, I grew up like this. All these folks are just playing catch-up. Thing is, we're humans. We're tribal. More settled things are, the bigger your tribe is. All the people in your gang, or all the people in your country. All the ones on your planet. Then the churn comes, and the tribe gets small again."

He waved a hand at the dark gray landscape. This far out, the trees weren't knocked over, but the weeds and bushes were starting to die from the dark and the cold.

"Right now," he said, "I figure our tribe at about two."

Either she shuddered at the idea or else the cold was getting to her worse. He stood up, squinting down the road. The tent guy wasn't coming. That was good.

"All right, Peaches. Let's get going. We're going to have to head off the road for a bit."

She looked north, up the road, confused. "Where are we going?"

"East."

"You mean where we aren't supposed to go because of some crazy asshole shooting at people?"

"Yup."

The town had been a decent size last week. Cheap little houses on narrow streets, solar panels on all the roofs sucking in the sunlight, back when there had been some. There were still people here and there. Maybe one house in five or six where the tenants were waiting for help to come to them or so deep in denial that they thought staying put was an option. Or they'd just decided they'd rather die at home. As rational a decision as any other, things being what they were.

They walked on the sidewalks even though there weren't many cars. A police van skidded by a few blocks ahead once. A sedan with an old woman hunched in the front seat who carefully ignored them as she passed. When the batteries ran dry there was no power grid to charge them back up, so all the trips were either short or one-way. One house had words painted across the front: EVERYTHING IN THIS HOUSE IS THE PROPERTY OF THE TRAVIS FAMILY. LOOTERS WILL BE HUNTED DOWN AND KILLED. That left him laughing for a couple of blocks. The supermarket at the center of town was dark, and stripped down to the shelves. So somebody in the place had understood the gravity of their situation.

The compound was on the eastern edge of town. He'd been worried they might walk by it without noticing, but it hugged the road and the signage was clear. PRIVATE PROPERTY. NO TRESPASSING. ARMED SECURITY ON SITE. His personal favorite was NO RELIEF SERVICES.

A wide, flat field of a yard led up to a white modular house. The transport parked in front of it looked like something manufactured to imitate military equipment. Amos had lived in an actual military design long enough to recognize the difference.

He put Peaches in place at the edge of the property first, then walked the perimeter once, taking it all in. The fence had barbed wire all the way around, but nothing electrified. He was about fifty-fifty that there was a sniper's nest in the attic, but it might have just been a bird. Easy to forget that even with the massive burden of humanity, there was still wildlife on Earth. The house itself was prefabbed or else printed in place. Hard to say which. He also saw three tubes coming up out of the ground that looked like they could be ventilation. There were bullet holes in the bark of the trees at the property's edge, and one place where it looked like there was blood on the leaves of the dying bushes.

This was where he wanted to be.

He started by standing at the edge of the property, cupping his hands around his mouth and shouting.

“Hey! In the house! You there?”

He waited a long minute, alert for signs of movement. Something behind the curtains of the front window. Nothing in the sniper’s nest. So maybe it was just sparrows after all.

“Hey! In the house! My name is Amos Burton, and I’m looking to trade!”

A man’s voice came, shrill and angry. “This is private property!”

“That’s why I’m out here fucking my throat up instead of ringing the goddamn doorbell. I heard you were prepped for this shit. I got caught with my pants down. Looking to trade for guns.”

There was a long silence. Hopefully the bastard wouldn’t just shoot him, but maybe. Life was risk.

“What’re you offering?”

“Water recycler,” Amos shouted. “It’s on the back of my rig.”

“I’ve got one.”

“May need another. Don’t think they’ll be making more anytime soon.” He waited to the count of ten. “I’m going to come up to the house so we can talk.”

“This is private property! Don’t cross the line!”

Amos opened the gate, smiling his biggest goofiest smile. “It’s okay! If I was armed, I wouldn’t be trading for guns, right? Don’t shoot me, I’m just here to talk.”

He crossed the line, leaving the gate open behind him. He kept his hands in the air, fingers spread. He could see his breath ghosting before him. It really had gotten cold. That wasn’t getting better soon. He wondered if he maybe should have said he had a heater.

The front door opened and the man came out. He was tall and thin with a stupid, cruel face and a long-barreled assault rifle aimed at the center of Amos’ chest. It had to be illegal as shit under UN gun laws.

“Hey!” he said with a wave. “My name’s Amos.”

“You said.”

“Didn’t get yours.”

“Didn’t say it.”

The man walked forward to take cover behind his pretend military transport.

“Nice rifle,” Amos said, keeping his hands up.

“Works too,” the man said. “Strip.”

“Come again?”

“You heard me. You want to trade with me, prove you’re not hiding any weapons. Strip!”

Well, that was unforeseen, but what the hell. Wouldn’t be the first guy he’d ever met who got off on feeling powerful. Amos shrugged off his shirt and heeled off his shoes one at a time, then dropped his pants and stepped out of them. The cold air bit his skin.

“Okay!” Amos said. “Unless I’ve got a pistol up my ass, we can agree I’m not carrying, yeah?”

“Agreed,” the man said.

“Look, if you’re still worried about it, you can get someone to come out, look through the clothes here. You keep the gun on me, make sure I don’t try anything.”

“Don’t tell me what to do.”

That was a good sign. Made it seem more likely that the fella was on his own here. He glanced up at the attic. If there were a second person, that would be the place to put them. Tiny gray-brown wings fluttered into the attic like the answer to a question.

“Where’s this cycler?”

“About three miles down the road,” Amos said, pointing with his thumb. “I can have it here in an hour, easy.”

“That’s okay,” the man said, lifting the rifle to his shoulder and sighting on Amos. The end of the barrel looked as big as a cave. “I can get it myself.”

Before he could pull the trigger, something moved through the field of his yard like a gust of wind. Only this wind had teeth. The man staggered back, then yawped in confusion and pain. With her chemical hormone blockers having faded in the days since they left the Pit, Peaches moved too quickly for Amos’ eye to follow. It was like she’d become an angry hummingbird. The man fell to his knees, his assault rifle suddenly gone and one of his fingers broken and bleeding. As he curled to grasp his broken hand, the gun stuttered, opening the man’s chest along the side.

And then Peaches went still, her prison gown flapping around her in the breeze, blood spattered down the length of her body, the assault rifle held in one hand. Slowly, she sank to the ground. By the time Amos had his pants back on and got over to her, her eyes had rolled back and she was vomiting. He put his shirt over her and waited until the fit passed. It wasn't more than about five minutes, and since no one else had come out of the house to investigate or take revenge, Amos was feeling pretty confident the dead man had been a bachelor.

She shuddered once, went still, and then the blankness left her eyes.

"Hey," she said. "Did we win?"

"First round," Amos said, nodding to her. "It like that every time?"

"Yup," she said. "It's really not a great design."

"Useful when it's useful, though."

"Is that. Are you okay?"

"Little chilly," Amos said. "Won't kill me. You stay here for a bit, okay? I'm gonna go see what we're looking at inside."

"I'll come with you," she said, trying to sit up. He put a hand on her shoulder. He didn't have to push to keep her down.

"I'll go first. I'd be surprised if it wasn't booby-trapped."

"Okay," she breathed. "I'll just wait here, then."

"Good plan."

The next morning, they set off from the little compound at dawn. They both had professional-grade thermal suits, even if his was a little snug and she had to roll up the cuffs. The bunker under the house had supplies enough to last for a year or two: survival gear, weapons, ammunition, high-calorie rations, a stack of surprisingly boring pornography, and a collection of beautiful hand-carved chess sets. The best find hadn't been in the bunker, though. The garage had a half-dozen unused but well-maintained bicycles, complete with saddlebags. Even with long rifles strapped over their shoulders and their packs weighed down with water and food, they covered the distance from the compound, through the town, and out to the highway in half an hour. By noon, they'd gone farther than three days' walking

would have taken them. It was probably seven hundred clicks from the Pit to Erich's office. They'd been able to cover just under thirty on foot. With the bikes, they'd more than double that. Baltimore was maybe nine days away, assuming nothing went wrong. Which, given the context, seemed like a lot to ask. But still.

They stopped for lunch at noon. It was dim enough it could have been the hours just before dawn. His breath was pluming in the air now, but between the exercise and the thermal suit, Amos didn't feel the cold. Peaches seemed about a thousand times better too. She was smiling, and there was color in her cheeks. They sat on an old bench beside the road, looking east. The view was mud and a scattering of debris.

And still on the horizon, the glow of something huge—a city or a fire—lit the clouds from below, gold on gray. So maybe even the end of the world had its moments of beauty.

Peaches took a bite of her ration bar and sipped the water from her self-purifying canteen. "Is it bothering you?"

"What?"

"What we did."

"Not sure what that was, Peaches."

She looked at him, her eyes narrowed like she was trying to decide if he was joking. "We invaded a man's home, killed him, and took his stuff. If we hadn't come through, he might have made it. Lived until the sun came back. Survived."

"He was gonna shoot me for no reason except that I had something he wanted."

"He wouldn't have done it if we hadn't gone there. And we lied to him about wanting to trade."

"Seems like you have a point to make, Peaches."

"If he hadn't been ready to pull the trigger, would you have let it go? Or would we still be here, with these guns and this food?"

"Oh, we were taking his shit. I'm just pointing out both sides of the argument had the same plan."

"Then we're not exactly the good guys, are we?"

Amos scowled. It wasn't a question that had even crossed his mind until she said it. It bothered him that it didn't bother him more. He scratched his chest and tried to imagine Holden doing what they'd done. Or Naomi. Or

Lydia.

“Yeah,” he said. “I should really get back to the ship soon.”

Chapter Thirty-one: Alex

You're in a good mood," Bobbie said as Alex sat down across from her. Her breakfast was oatmeal with an egg-like protein crumble, sausages, and hot sauce. Her hair, pulled back in a tight ponytail, was wet with sweat, and her cheeks were flushed from recent exertion. Just looking at her made him feel out of shape. But she was right. He was in a good mood.

"Captain's bringing my girl to Luna."

Bobbie frowned. "Your... girl?"

"The *Roci*."

"Oh. Right," she said. "For a second, I just thought... Yeah. It'll be good to see Holden too. And Avasarala."

"Be good to be on my own damn ship," Alex said, tapping pepper onto his plate of reconstituted eggs. "Now if we can just get Amos and Naomi back. Whoa. Did I say something?"

The shadow that had come over Bobbie's expression vanished again and she shook her head. "Nothing. Just... I don't know. Envy, I guess. It's been a while since I had people."

She stabbed one of the sausages with a fork and glanced around the mess hall as she ate it. Alex's eggs were chalky and tasted more of yeast than something that came from a chicken, and it brought decades of memory with it. "Being back around active-duty folks making it hard to look forward to civilian life?"

"Sort of."

"Things change," Alex said.

"And they don't change back," she said, quoting him back to himself.

Alex broke off a piece of toast, popped it in his mouth, and talked around the crust. "We still talking about the service?"

Bobbie smiled. “No, I guess we’re not. I still can’t really get my head around it. Earth’s never going to be Earth again. Not like it was.”

“No, it won’t.”

“Mars either,” Bobbie said. “I think about my nephew. Smart kid. Book smart, I mean. He hasn’t really been in the world except for going through university and then the terraforming project. That’s his whole life. He was one of the first people I knew to really get what off-world colonies meant for everything back here.”

“Yeah. It makes everything different,” Alex said.

“Except how we deal with it,” she said, then racked an imaginary shotgun and fired it off with a popping sound.

“Amazing how much we’ve managed to do, considering how we’re doing it all with jumped-up social primates and evolutionary behaviors from the Pleistocene.”

Bobbie chuckled, and he was glad to hear the sound. There was something about making the people around him feel better that left him feeling lighter himself. Like if the others on his crew could be upbeat, whatever it was couldn’t be that bad. He understood the flaw in that logic: if comforting them comforted him, maybe comforting him comforted them, and they could all drive the ship into a rock while they smiled at each other.

“I heard the relief ships are here,” Alex said.

“Yeah, that may not be as good as we’d hoped,” Bobbie said around a mouthful of sausage. “They were talking about it at training this morning. The relief ships should be getting in operational range right around now, but the scuttlebutt is the crews are all green as hell. Like first-mission green.”

“All of them?” Alex said.

“The good crews are all back at Hungaria covering our six.”

“Well. Better a bunch of teenagers flying with us than just the two frigates,” Alex said. “But you’ll excuse me if I’d hoped the cavalry coming over the hill was a little more experienced.”

“They probably said the same thing about us when we started up.”

“You know they did. First mission I flew solo, I almost dumped core by mistake.”

“Seriously?”

“Got flustered.”

“That’s military-grade flustered, all right,” Bobbie said. “Well,

hopefully, this'll be a milk run to Luna."

Alex nodded and took a sip of coffee from his bulb. "You think that'll happen? You really think it's over?"

Bobbie's silence was an answer.

They spent the rest of the meal on less fraught subjects: how training for marines and Navy were different and which one was better; Alex's stories from Ilus and the slow zone; speculation about what exactly Avasarala was going to do once they got the prime minister to Luna. It was all shop talk, and Alex found it easy and pleasant. He hadn't crewed with her in years, but she was good to talk to, good to be around. In another life, he could imagine shipping with her. Well, in the military anyway. He couldn't quite place her on a water hauler like the *Canterbury*, and he wondered what it would have done to have her on the *Roci*. Part of what made the *Rocinante* home was that the crew was so small, and had so much shared context. There was an intimacy that living in quarters with the same handful of people for so long gave. Anyone coming in—even someone as competent and smart and easygoing as Bobbie—would have had to contend with that, and there was nothing that screwed up a crew like having one person who felt excluded.

He was still thinking about that, chewing the next-to-last mouthful of so-called eggs and listening to Bobbie tell a story about free-climbing on the Martian surface, when the Klaxons went off.

"All hands to battle stations," the calm, crisp voice said between whoops of the alarm. "This is not a drill."

Alex was up and heading toward his crash couch before he fully registered what was going on. Bobbie was beside him. They both threw their breakfast trays and drink bulbs into the recycler on the way out, long training identifying anything that wasn't bolted down as a potential projectile if the ship's vector changed too suddenly. The staccato vibration of the PDCs was already ringing in the decks, but Alex couldn't imagine what could have gotten near enough for that kind of close combat without being noticed. The alarms were still going off when they reached the corridor and one of the marines—Sergeant Park, his name was—gathered them up.

"No time to get you to your quarters. There are some spare couches we can put you up in over here."

“What’s going on?” Alex said, trotting to keep up.

“The relief ships are firing on us,” Park said.

“What?” Bobbie snapped.

Park didn’t break stride, opening a hatch into an empty meeting room and ushering them in. Alex dropped into the embrace of a crash couch, strapping himself down with an efficiency of long habit and deep training. His mind was tripping over itself.

“Someone faked military transponder codes?” he said.

“Nope, they’re our birds,” Park said, checking Alex’s straps.

“Then how—”

“We hope to beat that answer out of them when the time comes, sir,” Park said. He switched to Bobbie’s chair and checked her straps too while he spoke. “Please remain in your couches until we signal that it’s safe to get out. Not sure what we’re looking at, but I expect this may get—”

The ship lurched hard, snapping the gimbals of the couches forty-five degrees to the deck. Park shifted, bracing just before he hit the wall.

“Park!” Bobbie shouted, reaching for the straps that held her in. “Report!”

“Remain in your couch!” the marine shouted from behind Alex and below him. The press of thrust gravity sank him deep into the gel. A needle slid into his leg, pumping a cocktail of drugs into his bloodstream that would lessen the danger of stroke. *Jesus, this was more serious than he thought.*

“Park!” Bobbie said again, and then a string of obscenities as the marine stumbled out the door and into the corridor, leaving them behind. “This is fucked. This is so fucked.”

“Can you get anything?” Alex shouted, even though she was only a meter and a half away. “My control panel’s locked out.”

He heard the sound of her breath over the distant vibrations of the PDCs, the deeper tones of missiles launching. “No, Alex. I’m getting the stand-by screen.”

A loud fluting groan passed through the deck, rattling the couches as they shifted again. Whoever was at the helm, they were putting the ship through its paces. Along with the deep, recognizable reports of the ship’s weapons, there were other sounds, less familiar ones. Alex’s mind turned all of them into damage from the enemy, and at least some of the time, he was

sure he was right. His throat was tight, and his gut hurt. He kept waiting for a gauss round to pass through the ship, and every second it didn't happen made it feel more likely that it would.

"You doing all right?" Bobbie said.

"Just wish I could see what was going on. Or do somethin' about it. Don't mind fighting, but I hate being spam in a can."

His stomach lurched, and for a long moment, he mistook the sudden weightlessness for nausea. His crash couch shifted to his left, Bobbie's to her right, until they could almost see each other.

"Well," Bobbie said. "They got the drive."

"Yup. So that thing where you and Avasarala thought maybe someone was appropriating MCRN ships and supplies?"

"Look pretty smart now, don't we?"

The couches shifted again as maneuvering thrusters on the ship's skin fought against the massive inertia of steel and ceramic. The throbbing of PDCs and report of missile launches made a rough background music, but it was a quiet that caught Alex's attention.

"The bad guys," he said. "They stopped shooting."

"Huh," Bobbie said. Then a moment later, "Boarding action, then?"

"What I was thinking."

"Well. How long do you want to stay in these couches before we go try to scare up some weapons?"

"Five minutes?"

"Works for me," Bobbie said, taking out her hand terminal. "I'll set a timer."

The door of the meeting room cycled open at three minutes, twenty-five seconds. Three marines floated through in light battle armor, bracing against the doorframe and holding assault rifles at their sides. The first one—a thin-faced man with a scar running down the side of his nose—moved forward. It struck Alex that if the bad guys, whoever they were, had Martian warships, they probably also had Martian armor, but the thin-faced man steadied himself against the desk.

"Mister Kamal. Sergeant Draper. My name's Lieutenant de Haan. The ship's going to be maneuvering, so we'll need to be careful, but I need you to come with me now."

"Roger that, sir," Bobbie said, popping the straps on her couch loose and

shifting to launch for the door. Alex was only a beat behind her.

The marines moved through the weightless halls with practiced efficiency, cover to cover with one always in firing position at the back, another at the front, and Bobbie and Alex in the center of the formation. Twice, the ship lurched with Alex in the middle of a jump from one handhold to the next. The first time, he caught himself on a different support, but the second, he bounced off a bare length of deck, spinning through the air until one of the marines grabbed him and hauled him to safety. The one-sided sounds of battle grew first louder and then more distant. One bulkhead failed to open, reporting vacuum on the other side, and they had to backtrack. Like a restless dream, the journey seemed to go on forever and also be over almost as soon as it had begun.

On the bridge, the captain was strapped into her couch, the prime minister in the couch beside her. All around, the crewmen at their stations were rattling information to one another, and Alex caught bits of it, his mind forming a picture of their situation almost without knowing what exactly he'd heard to inform it. The main drive was down. The comm array was unable to transmit either broadcast or tightbeam. There were hull breaches near engineering, the armory, and aft storage. Missiles could still be fired, but the guidance systems were down. No one mentioned the two frigates that had been flying with the ship since the main escort had been pulled away. Alex figured that meant they were dead.

"We are under attack and being boarded," the captain said, her voice remarkably calm. "The original escort force is also now under concentrated attack, and will be unable to come to our relief. We have put out a broad distress call, but it seems unlikely in the extreme that anyone could make it here in time to affect the outcome of the conflict. We are preparing to offer a vigorous defense, but if we are unable to assure your safety, it may become necessary for you to evacuate."

"Into the middle of a firefight?" Alex said.

"It isn't optimal," the captain said. "With respect, my first priority has to be the safety of the prime minister."

"Of course, Skipper," Bobbie said at the same time that Alex said, "That's sounding a mite ominous." The captain ignored both of them.

"We have half a dozen rescue pods prepped. Protocol is to give each of you an armed escort in the pod, and release them all at once, in hopes of

distributing enemy attention and giving each of you the best possible chance of being overlooked.”

“That’s a shitty plan,” Alex said to the captain, then turned to the prime minister. “You know that’s a shitty plan, don’t you, sir?”

Smith nodded. His face was flushed, and a thin sheen of sweat danced across his neck and jowls, surface tension adhering it to his skin.

“Yeah,” Bobbie said. “Pods don’t have an Epstein. You’d be dropping us out there to get shot. And we have a racing yacht right here. The *Razorback*’s built for speed.”

The captain raised her hand, demanding silence. “What I was going to say? We can commandeer the *Razorback* for the prime minister, give her a pilot and an escort guard, but that means I’m still dropping two civilians into a meat grinder.”

“Why the hell would you do that?” Bobbie interrupted. “We’ve got a pilot and an escort right here. Don’t we? We can put Prime Minister Smith in the bunk and take the couches. Alex has more experience piloting that ship than any of you, and—all respect to Lieutenant de Haan—I can shoot as straight as anyone you’ve got. It’ll be tight, but it’s totally possible.”

“That’s where I was going, yes,” the captain said, her voice buzzing with annoyance. “In addition, the prime minister has made it clear that for political reasons, the presence of Sergeant Draper is required on Luna, so —”

“They said yes, Captain Choudhary,” the prime minister snapped. “Take yes for an answer.”

“Lieutenant?” Bobbie said. “If I’m acting escort on this mission, I’d really like to have a weapon.”

The thin-faced man smiled, his eyes glinting and cold. “I can arrange that, Gunny. Captain?”

The captain nodded sharply, and Lieutenant de Haan launched for the lift, Bobbie close behind him. Alex’s heart was beating double-time, but the fear was tempered by a growing excitement. Yes, he was in danger of losing his life. Yes, an unknown enemy had them surrounded and were likely about to storm the ship itself. But he was going to get to fly in battle again, and some immature, juvenile part of his soul could hardly wait.

“We will use our PDCs to cover you as long as we can,” the captain said, and Alex interrupted her again.

“Not going to be enough. If we’re burnin’ all the way to Earth... we can probably outrun the enemy ships, but their missiles don’t have to worry about keeping anyone inside from getting squished by thrust. And it ain’t like there’s anything out here to hide behind.”

“You’ll have to think of something,” the captain said.

“All right,” Alex said. “Set a bunch of missiles to match the frequency of the *Razorback*’s comm laser. Launch as many as you can with us when we go, and Bobbie can use our laser to target incoming fire. We’ll outrun their ships and shoot down their missiles. Unless there’s someone between here and Luna or we run out of missiles, we should be fine.”

As long as we don’t get shot the second we launch, he didn’t add.

The captain blinked and shot a glance at the prime minister. There was a question in the politician’s eyes. Captain Choudhary shrugged. “He thought of something.”

“You mean—”

“No,” the captain said, “that might... that might work.”

“Captain!” A voice came from behind them. “We have confirmed enemy contact at decks seven and thirteen. Permission to use heavy weapons?”

“Permission granted,” the captain said, then turned to Alex. “I think that’s your cue to head out, Mister Kamal.”

“Thank you, Captain,” Alex said. “I’ll make this work if I can.”

The prime minister unstrapped and floated up out of his couch until one of the two remaining marines grabbed him and pulled him back into orientation. The prime minister and the captain shook hands as another voice interrupted.

“Captain, we’re getting a message from the attacking force. From the *Pella*.”

“Their command ship,” the prime minister said to Alex.

“More demands of surrender?” the captain asked.

“No, sir. It’s broadcast, not tightbeam. It’s... well, holy shit.”

“Give it to me, Mister Chou,” the captain said. “From the start.”

An audio feed clicked on. Thick static crackled, vanished, then crackled again. Someone grunted, and it sounded like pain. When the voice finally came, it was focused and serious. And it hit Alex like a kick to the belly.

“If you receive this, please retransmit. This is Naomi Nagata of the *Rocinante*...”

Chapter Thirty-two: Naomi

She knew it was coming before it came. Before she even knew what it would be. The feeling of the ship changed without any of the details shifting, at least not at first. The crew still watched the newsfeeds and cheered. She was still under constant guard and treated like a mascot: James Holden's tame girlfriend brought back to the cage where she belonged. Marco was polite to her, and Filip was caught between approaching and avoiding her. But there was a difference. A tension had come into the ship, and she didn't know yet if they were all anticipating news of another atrocity or something more personal and concrete. All she was sure of at first was that it made it harder for her to sleep or eat. The dread in her gut was too heavy.

No one told her anything, and there was no single moment when she drew her conclusions. Instead, she looked back, and details filtered through from her days in captivity. A few remained, trapped by a nearly occult sense of importance. Wings showing off in his Martian uniform, a broad-shouldered girl hardly older than Filip exercising with the steady focus of someone preparing for something she knew she wasn't prepared for, Karal steering her own inventory busywork toward the armory and its store of powered armor, the seriousness with which Cyn tried the weight of each of the guns in his hands. Like the sediments of dust that built up in a badly maintained duct, the small things came together over time into a shape that was almost the same as knowledge. They were going into battle. And more than that, they were ambushing a Martian force.

When she found Miral and Aaman sitting knee-to-knee in the corridor outside the medical bay, she knew the moment was almost on her, and the hope she'd been hiding even from herself bloomed up in her throat, as wild

as anger.

“This is the *Pella*,” Miral said, concentrating on each syllable. “Confermé course match.”

“Confirming,” Aaman said gently.

Miral balled his hands into fists and tapped the deck with them. “Fuck. What did I say?”

“Confermé. You want confirming.”

“Again,” Miral said, then cleared his throat. “This is the *Pella*. Confirming course match.”

Aaman grinned. “Course match confirmed, *Pella*.”

Miral looked up, noticed Naomi and Cyn approaching, and grimaced. Naomi shook her head. “You sound great,” she said. “Very Martian.”

Miral hesitated, caught, she guessed, in the uncertainty of what she knew and was supposed to know. When he smiled, it was almost sheepish. Naomi smiled back and kept walking, pretending that she was one of them. That she belonged. Cyn, beside her, made no comment but watched her from the corners of his eyes.

The mid-shift meal was refried noodles and beer. The newsfeed was set to a system-wide report, and she watched it avidly for the first time, not for what it said, but what it didn’t. Food and water reserves were running out in North America and Asia, with Europe only a few days better. Relief efforts from the southern hemisphere were hampered by a growing need for supplies locally. She didn’t care. It wasn’t Jim. Medina Station had gone dark; the basic carrier signal remained, but all queries were being ignored, and she didn’t care. The Martian minority speaker of parliament back in Londres Nova was calling for the prime minister to return immediately to Mars, and she only cared a little. Every story that wasn’t about a ship blowing up at Tycho Station was a victory. She ate fast, sucking down the sweet, pale noodles and slamming back the beer, as if by hurrying her meal, she could rush the ship, the attack.

Her opportunity.

She and Cyn spent the next half shift going through engineering and the machine shop, making sure everything was locked down. In a ship full of Belters, she had no doubt it all would be, and it was. The ritual of it was reassuring, though. The sense of order and control over a ship’s environment was a synonym for safety. Belters who didn’t triple-check

everything had been weeded out of the gene pool fast, and seeing the regularity of the shop gave her an almost atavistic sense of comfort. And also, without being obvious, she checked the location of the flawed toolbox with its misshapen hasp and then carefully didn't look at it again. She felt obvious, sure that by so clearly cutting the box out of her awareness, she was actually calling Cyn's attention to it.

The relationship between the dark thoughts and the nearly unbearable swelling of excitement in her heart didn't occur to her until Cyn's hand terminal chimed and he called the work to a halt.

"Wrócić do tu crash couch, yeah," he said, touching her shoulder. His hand was gentle but strong. She didn't pretend ignorance, didn't try to disguise her anxiety. It would just read as being scared of the battle anyway.

When they got to her quarters, she strapped in and Cyn checked her. Then, to her surprise, he sat by her side for a moment, his mass shifting the balance of the couch. His muscles rippled under the skin with even his smallest movements, but he still managed to seem boyish and shy, like his body was a costume. "Zuchtig tu, sa sa?"

Naomi smiled the way she imagined she would have if she'd meant it. "Of course I'll be careful," she said. "Always am."

"La, not always, you," Cyn said. He struggled with something. She didn't know what. "Close quarters, means a lot of maneuvering. Don't have a couch to catch you, then you get a wall, yeah? Maybe a corner."

Fear flooded her mouth with the taste of copper. Did he know? Had he guessed? Cyn flexed his hands, not able to meet her gaze.

"En buenas mood, you. Happy, ever since you and Marco. So I'm thinking maybe you think there's something to be happy for, yeah? Maybe a way out don't have doors."

Suicide, she thought. He's talking about suicide. He thinks I'm going to unstrap in the middle of the battle and let the ship beat me to death. While she hadn't consciously considered it before, it was the kind of thing the dark thoughts would have brought her. And worse, the thought brought no surprise with it, but only a sense of warmth. Almost of comfort. She wondered whether that had been in her mind, whether the danger inherent in her plan was its drawback or a covert way for the bad thoughts to find their expression. That she wasn't sure unnerved her.

"I plan to be here when this is over," she said, biting the words as if to

convince herself as much as her guard.

Cyn nodded. The ship's system sounded the maneuvers warning, but the big man didn't get off the couch. Not yet. "Esá? Hard for us and you both. We come through, yeah? All of us, and you too." He was staring at his hands now like something might be written there. "Mi familia," he said at last. "Remember that. Alles lá son family, y tu bist also."

"Go strap in, big guy," Naomi said. "We can finish this after."

"After," Cyn said, shot a smile at her, and rose. The second warning came, and Naomi leaned back into the gel, just as if she meant to stay in its cool embrace.

On the bridge, Marco was no doubt being smooth and calm, playing the part of the Martian captain, reassuring everyone he could that everything was under control now that he was there. They'd believe him too. He was in a Martian ship with a solid, known transponder. He was probably using Martian military encryption. That he could be anything other than what he seemed would be as inconceivable to them as it was obvious to her.

She wanted to care, but she didn't. She didn't have time.

The sound of missiles firing and the mutter of PDCs came as the room lurched thirty degrees to the left, her couch hissing on its gimbals. She popped the straps loose and sat up, pulling her leg away from the needle. If she'd been sure it wasn't a sedative, she'd have waited for the injections. Too late. The couch shifted back to neutral position. She hopped down to the floor and walked quickly and steadily for the corridor. She kept her arms wide, fingertips against the walls on either side, and slid her feet across the deck. *Knees bent, center of gravity low*, she told herself.

Be ready for the change when it comes. The ship twitched around her. The walls and deck showed nothing, her eyes promising her that everything was solid, quiet, and stable as her own mass pushed her, falling toward one wall and then the next, and then—worst—forward where there was nothing to catch herself against. It was worse than weightlessness. The struggles of a mind to interpret up and down in the absence of gravity could be disorienting, but this was something else. She rattled down the hallway like dice in a cup, moving forward when she could, bracing herself against the walls when the motion was too violent.

In the lift, she selected the machine shop and gripped the handholds as the mechanism dropped her down the body of the ship. A concussion rattled

her. The Martians fighting back. That was fine. Let them. She couldn't give that struggle her attention. Not until hers was done.

The machine shop was empty, all the tools locked in place, but with enough tolerance that when the ship lurched, they all rattled: metal against metal like the ship itself was learning to talk. She went for the compromised toolbox, but the deck fell away under her. She stumbled, her head crashing against the metal shelves. For a few seconds, the rattling seemed to recede. She shook her head, and drops of blood pattered on the wall and the deck.

Not a big deal, she told herself. Head wounds always bleed a lot. It doesn't mean it's serious. Keep moving.

The PDCs chattered, the sound moving through the body of the ship. She found the toolbox, popped open the restraint, pulled it out, and sat on the deck, cradling it. For a long, sick second, she thought the lock was different, solid, unapproachable, but that was wrong. A trick of the mind. It was fine. She pulled at the latch, worked her fingertips into the crevice that shouldn't have been there, then pulled it wider, and pushed in again, driving her own skin and bone into it like a wedge. It hurt like hell, but she ignored it. The pressure of her body against the deck suddenly grew terrible. They were accelerating. She didn't know why. Her back ached. It had been years since her spine had been asked to support her body during a heavy burn. Usually, she was lying on her back in gel around now.

With an indignant pop, the latch gave. The toolbox flew open, but nothing spilled. All the wrenches, epoxy welders, voltage meters, and cans of air and lubricant were strapped in place. She flipped through the close-packed layers to a line of Allen wrenches and plucked out the 10 mm. It was one of the advantages she had over Marco and his crew. She'd been living in a Martian ship for years. Knowing what tools opened which access panels was like recognizing the back of her own hand. She gathered up a voltage tester, a wiring crimp, and a light-duty soldering iron and stuffed them in her pockets. With any luck, she'd only need the wrench, but—

The deck drifted away under her, gravity suddenly gone. She couldn't tell if she was spinning through the air or the ship was turning around her. She reached for the deck, the walls, but nothing was within reach besides the floating toolbox. That was good enough. She grabbed it in close to her belly, then pushed it away as reaction mass, and twisted to grab the workbench. Down came back, and the toolbox crashed down behind her as

she stumbled. Another low boom rattled the ship. Knees and spine aching, she ran for the lift.

Gravity vanished again as she got into it. The PDCs were still chattering, but less now. She didn't remember the last time she'd heard a missile fire. The battle was winding down. She willed the lift to travel faster. If the all clear sounded and other people got out of their couches before she was done, then Holden and the *Rocinante* and possibly a fair percentage of Tycho Station would die. With every slow meter the lift took her, she imagined it: the drive cycling up and then spilling out, a fire brighter than light that ate everything. The ship moved, slamming her against the wall hard enough to bruise, then released her to float free again. She killed the lift between the crew quarters and the airlock, bracing herself so that the deceleration didn't leave her trapped in the middle of empty air.

The access panel was fifteen centimeters high and forty wide and opened on the major electrical routing through the center of the ship. If she'd cut through all the cables there with a welding torch, all the traffic would have rerouted instantly to other channels. Apart from a few warning indicators, nothing would happen. That was fine. She didn't want to break the ship. She wanted to use it. Braced with both feet and one hand in the wall handholds, she worked the Allen wrench. The screws were integral to the plate and didn't come free, but she felt it when the metal threads lost their grip. Three connections came off. Four. Five.

Six.

She could see the handset through the gap where the plate was beginning to come free. The ship shuddered under her, turning. She squeezed the wrench in her fist, seeing it fall away down the shaft even though it wasn't happening. A thick red-black clot of blood slipped free of her hair, smearing itself across the pale wall. She ignored it. Seven connectors were loose. Eight. She heard voices from the crew quarters. A woman saying something she couldn't make out, and a man answering no. Nine. Ten.

The plate came free. She scooped up the handset, checking its charge. The batteries were nearly full. Connection read good. She didn't know which circuit was the broadcast and the first one she tried threw an error code. Cursing musically under her breath, she set it to diagnostic mode and started querying. It seemed to take forever before it came back. She cycled

through the report with her thumb until she found it. Channel eighteen was a comm array using the D4/L4 protocols that the *Rocinante* did for broadcast. She thumbed in the override code that would let her send thirty seconds of diagnostic tones out, then deleted the file that held the tones. When the error came up, she told it to override to manual. She was almost weeping now. Her right foot slipped, and she grabbed for the open access panel. Her knuckles scraped something sharp and toothy. She grunted in pain and put her annoyance aside. No time.

“If you receive this,” she said, pressing the handset close to her lips, “please retransmit. This is Naomi Nagata of the *Rocinante*. Message is for James Holden. The software controlling the magnetic bottle has been sabotaged. Do not start the reactor without reloading the hardware drivers from a known good source. If you hear this message, please retransmit.”

Halfway through the last word, the handset chirped that the thirty seconds were up and returned to the base menu. She let the handset go, let herself go, floated back from the wall. She spread her arms wide and let the Allen wrench go. She hoped it had worked. It was the middle of a battle. There could be jamming to contend with if Marco wanted to keep what was happening unclear, but it was just as likely he was enjoying being a spectacle. And if she was right, if they were going after the Martian prime minister, the data coming off the battle would be gone over by the best intelligence services that still existed.

Jim wasn’t safe, not yet. She knew it, but for a moment, she didn’t feel it. The darkness would come back; the bone-crushing anxiety, and the guilt and the fear. She didn’t doubt that, but now, right now, she felt only light. She’d made her plan, and it had worked. Her warning would reach him or it wouldn’t. Either way, there was nothing more she could do. And on the bridge, right now, Marco was figuring out what exactly she’d done. The laughter that came boiling out of her throat felt like victory.

The voices from the crew quarters grew louder, more confused. Even though the all clear hadn’t been called, she heard people moving around. She recognized Cyn’s voice, raised in alarm. Her leg brushed against the wall, and she reached out to hook her wrist into the handhold. No point bothering with the lift. Hand over hand, she pulled herself along the shaft and then into the corridors. The faces that peered from the doorways were wide-eyed. One man started back when he caught sight of her. Naomi

launched herself along the hallway with a kick and flew straight as an arrow, not even touching the handholds along the way to steady herself. Her shoulder ached. The wound on her scalp was bleeding again. She felt serene.

Cyn hauled himself around a corner, then braced and watched her, his jaw slack, his eyes round. She lifted a fist in greeting as she floated by.

“Anyone needs me,” she said, “I’ll be in my quarters, yeah?”

Chapter Thirty-three: Holden

Most of human history had static maps. Even in times of change and chaos, when civilizations had fallen in the course of a single night, the places remained more or less the same. The distance between Africa and South America was going to stay what it had always been, at least over the span of human evolution. And whether you called it France or the Common European Interest Zone, Paris was closer to Orléans than Nice. It was only when they moved out to Mars and then the Belt and the worlds beyond it that the distance between the great centers of human life became a function of time. From Tycho Station, Earth and Luna were almost on the far side of the sun. Mars was closer, but retreating with every hour. Saturn was closer than either and the Jovian moons farther away. That everything came closer and then farther apart was a given in Holden's life; uncommented and unremarkable. It was only times like this that facts of orbital periodicity started to seem like a metaphor for something deeper.

As soon as Fred made the decision to go to Luna, Holden had moved his things back to the *Rocinante*. And then the rest of the crew's possessions too. He'd found Amos' clothes neatly folded and regimented in a rough canvas bag. Alex's had been thrown haphazardly in a case, half in a mesh bag and half not, though which set was clean and which bound for the laundry, Holden couldn't tell. Naomi's things had been in his suite. A spare pair of boots, an unpaired sock, underwear. She'd left a model of a Martian combat mech—bright red and flat black and no bigger than his thumb—on the bathroom counter. He didn't know if it held some special meaning to her or if she would even remember where she'd gotten it from. He was careful to take it with him, though. Careful to wrap it and put it in a cushioned box. It was the closest thing he had to taking care of the woman it belonged to,

so that was what he did.

Being back in the *Rocinante* was like coming home, except that it was too empty. The narrow corridors of the crew deck seemed too wide. The occasional ticking and popping of the expansion joints adjusting to shifts in temperature were like the knocking of ghosts. When the repair team were somewhere he could hear them, Holden resented the voices and footsteps that weren't his crew's. When they were gone, the silence oppressed him.

He told himself it was temporary. That before long, he'd have Alex back in the cockpit and Amos down in engineering. Naomi beside him, telling him gently what he was screwing up and how to do it better. He'd go to Luna, and they'd be there. All of them. Somehow.

Except he still hadn't heard from Naomi. He'd gotten a short text-only message from Mother Tamara that his parents were all right for now, but that ash was falling on the ranch like snow in winter. And nothing from Amos.

Sometimes people knew when they were saying their last goodbyes, but not always. Not often. Most people's last parting of ways were so small, the people involved didn't even notice them. Now, in the darkness of the command deck with a half-liter bulb of bourbon floating beside him and the audio system playing twelve-bar blues, Holden was pretty sure he'd said a couple of his own final goodbyes and not known it. He replayed everything in his head, his memories becoming less authentic and more painful every time he did.

"We're all that's left," he said to the ship. "You're all I've got."

The *Rocinante* didn't answer for a long moment, and then, weirdly, it did. A bright yellow incoming request alert appeared on his console. Holden wiped his teary eyes with a sleeve and accepted it. Fred Johnson appeared in a window, his brows furrowed.

"Holden?"

"Fred?"

"Are you all right?"

"Ah. Yes?"

Fred leaned forward, his head growing massive on the screen. "I've been trying to reach your hand terminal for the past fifteen minutes."

Holden looked around the command deck, then nodded. "I may have left it in my pants. In my quarters. I think I did."

“Are you drunk?”

“I think I am.” He had to concentrate not to slur.

“And you’re not wearing pants?”

“I’m not ready to take our relationship there yet.”

“Well, have the med bay give you something to sober you up and get your ass covered. I’m sending the flight crew over.”

Holden turned up the lights and killed the music feed. “What’s going on?”

“We’re getting reports. The Martian prime minister’s under attack. The ships your man Alex found were decoys to draw off the escort.”

“But,” Holden said, “the new escort ships—”

“Are the ones shooting at him.”

Holden cursed under his breath. “Alex is on that ship. Did we hear from Alex?”

“We haven’t heard from anybody. I was keeping some radio telescopes pointed that direction, and this is what they’re getting. I checked with Drummer and the engineering staff. They said the *Roci*’s got a clean bill of health, and I’m less and less interested in sitting around here waiting for whoever’s behind all this to take another swing at me.”

Holden undid the straps on his couch, floating forward. His head was a little swimmy. He looked around at the command deck. It was like some part of his brain was still expecting to see Alex and Naomi and Amos there with him. He hadn’t realized it was a habit, to look for his people before the *Roci* got under way. This, he realized, was the first time ever that they wouldn’t be there. It felt like a bad omen.

“Okay,” he said. “I’ll clean up for company. When are you looking to go?”

“How soon is as soon as possible?”

“The reactor’s cold, and we’d want to top up the air and water,” Holden said. The alcohol fumes seemed to be burning away already, but he wasn’t entirely sure if that was true or if it just felt that way. “Plus I’m reliably informed that I need to get something from the med bay to sober me up and get my ass covered.”

“Glad you were paying attention,” Fred said. “So two hours?”

“I think we can manage that.”

“Let’s do.”

Holden pulled himself down the lift shaft hand over hand. A new crew coming onto his *Rocinante*. It was the obvious thing, of course. It had always been the plan, but now the prospect filled him with dread. Unfamiliar faces at the controls and in the crew quarters. Voices in the ship that weren't the ones he'd gotten used to in the years since the *Donnager*. Even when they'd been carrying passengers, his crew had been at the heart of the ship. This was something else, and he didn't like it.

He stopped at the med bay on the way to his quarters. Sober, the symbolic implications of a new temporary crew for the trip to Luna didn't seem quite as ominous, but the thought stayed at the back of his mind: without Naomi—without all his crew—the *Rocinante* wasn't going to be what she had been. When he checked his hand terminal, the only messages were from Fred. Alex's silence didn't help.

The transport tube's connection to the airlock was a gentle thump, like Tycho Station clearing its throat. Holden was at the airlock to let them in. Eight people—six Belters, and two who looked like they'd come from Earth, all wearing Tycho Station flight suits and hauling small personal kits—floated into the space among the lockers. Drummer was with them, wearing her security uniform.

"Captain Holden?" Drummer said. "I'd like to introduce Captain Foster Sales and his crew."

The man who floated up, arms braced, looked too young to be a captain. Close-cropped black hair transitioned into a glossy beard that tried and failed to lend the boyish features some gravitas. He was introduced to the others—pilots Arnold Mfume and Chava Lombaugh, engineers Sandra Ip and Zach Kazantzakis, weapons technicians Gor Droga and Sun-yi Steinberg, communications specialist Maura Patel. By the end of the little ceremony, Holden was pretty sure he'd already forgotten all of their names.

Drummer seemed to read his unease, because when the crew broke to their stations, she lingered and drew him aside. "They're good people, Captain. I vetted all of them myself. None of them are the bad guys."

"Yeah," Holden said. "That's good."

Her smile was weirdly gentle. "It's weird for me too."

"Yeah?" he said.

"On my watch, they broke into the station, stole the fucking protomolecule. They tried to kill the boss. I'm spending all day projecting

an attitude of calm and control, and come sleep shift, I'm grinding my teeth and staring at the wall. Now the old man's leaving? Honest to God, I'm shitting bricks here."

Holden blew out a long breath. "Thanks for that."

"Anytime, sir. Everyone you meet's fighting a hard battle."

"Should I know anything about..." He nodded toward the door. Drummer briefed him in quick, simple sentences. Ip's roommate had been one of the turncoats, and she still felt betrayed. Steinberg and Mfume both had a hard time losing face, and while it wasn't usually a problem, if they got into a spat, someone would have to step in and deescalate. Droga had family on Earth, and he was worried and angry and grieving. Holden made a note to speak to the man if he had a chance. With every small detail, every fault and vulnerability, every strength and peculiar virtue, Holden felt something in his chest grow calmer.

Okay, these men and women weren't his family, but they were his crew. They wouldn't ever mean what Alex and Amos and Naomi meant, but for the next weeks, he was their captain. And that was enough.

For now, that was enough.

When Fred came through the airlock, Drummer was just finishing her rundown of Maura Patel's insomnia problem. Fred landed feetfirst on the wall, ankles hooked into the handholds like he'd been born in the Belt. He stood at ninety degrees to them, a rough smile on his face and a small personal kit strapped to his back.

"Well, what are you two doing?"

"Drummer is very gently telling me how to put on my big-boy pants," Holden said.

"Really?" Fred asked.

"It's possible I was getting a little maudlin."

Fred nodded. "Happens to the best of us from time to time. Where do we stand?"

Drummer answered. "The crew's initiating the warm-up. We haven't had anyone reporting trouble, so you should be good to go on schedule."

"Excellent," Fred said. "Of course, they've probably taken all the good bunks by now."

"All the bunks are the same," Holden said. "Except mine. You can't have mine."

“Wouldn’t think of it, Captain,” Fred said. “The Martian convoy’s put out a distress call. The original escort’s trying to burn back toward them, but the mystery ships are engaging in force now. As ambushes go, this one’s looking pretty effective.”

“Sorry to hear that,” Holden said. “Still nothing from Alex.”

“Well. We can hope for the best,” Fred said. “Latest intel shows the attackers have stopped firing. So that makes it look like a boarding action.”

Holden’s blood went cold. “Protocol is they blow the ship if boarders get close to taking engineering or the CIC.”

“That’s so that the enemy doesn’t compromise your codes,” Drummer said. “They rode in on Martian naval ships. That damage is already done.”

The three were silent for a moment. When Fred spoke, his voice was low and mordant. “Well, that’s cheerful. You coming to help this along, Captain?”

Holden looked at Drummer. She held herself professionally at attention, but he thought he saw a glimmer of unease in her eyes. Fred Johnson had run Tycho Station for almost two decades, and now he was leaving. He might not come back. And Holden might not either.

Everyone you meet is fighting a hard battle.

“Let’s give this part to Foster,” Holden said. “Let him get a feel for the ship. There’s something I need to take care of on the station before we go.”

Monica was in new rooms. To look at her, sitting on the couch, it was like she was meeting him for the first time. The months they’d spent—her crew and his—shipping out to the Ring, the desperate work she’d done on the *Behemoth* back before it became Medina Station, her abduction and his rescue of her. All of it was gone. Her expression was polite, and it was closed.

“So,” Holden said. “I’m about to take off. I’m not sure when or even if I’ll see you again. And I feel like we’re not good.”

“Why do you feel like that?”

“Off the record?”

The silence cooled the room, then Monica took her new hand terminal

out of her pocket and tapped it twice. It chimed and she rested it on her thigh. "Fine. Off the record."

"Because I lied to you, and you know it. And you're angry about it. And because you tried to get me to talk about things I didn't want to talk about by springing questions on me in the middle of an interview, and I'm angry with you about that."

Monica sighed, but her face softened. She looked older now than when they'd first met. Still camera-ready and perfect at all times, but worn by the universe. "What happened to you, Holden? You used to be the man who didn't hide anything. You were the one voice everyone could trust, because even if you didn't know all of it, you'd at least tell the truth you did know. This reading the press release thing? It's not you."

"Fred asked me not to say that he'd been targeted."

"Or that they got away with the protomolecule sample," Monica said, then held up her hand terminal. "We're off the record. Do me the courtesy of not lying to me now too."

"And that they got away with the protomolecule," Holden said.

Monica's face softened. She scratched her arm, fingernails hissing against the cloth. "That's critical. That's the scariest thing that's happened since this all started. Don't you think that people have a right to know the danger they're in?"

"Fred knows. He's told Avasarala and Smith. Earth and Mars know. The OPA knows. Panicking people for no reason—"

"Panicking at this point isn't unreasonable," Monica said. "And deciding for people what they should get to know so they do what you think they should do? That isn't how the good guys act, and you know it. It's paternalistic, it's condescending, and it's beneath you. Maybe not them. The political movers and shakers. But it's beneath *you*."

Holden felt a warmth rising in his chest. Shame or anger or something more complicated, he couldn't say. He remembered Mother Tamara saying *It hurts most if there's something true in it*. He wanted to say something mean. To hit back. He laced his fingers together. "Does what you do matter?"

"What?"

"Reporting? Telling things to people. Does it have any power?"

"Of course it does."

“Then how you use that power matters too. I’m not saying that we were right to put the protomolecule thing under the rug. I’m saying that telling everyone about it—especially right now while whatever the hell this is is still going on—is worse. When we were in the slow zone, you were the voice that pulled us all together. You gave a shape to that moment of chaos. And it made people safer and calmer and more rational. More civilized. We need that again. I need that again.”

“How can you say—” Monica began, and her hand terminal buzzed. She looked down at it in annoyance, then did a double take. She lifted a finger to him. Just a second.

“What is it?” Holden said, but she was reading her terminal, her eyes getting wider. “Monica? If this is some kind of object lesson about how shitty it is to withhold information, I admit it’s weirdly elegant. But if you could stop it now—”

“The attack ships. The ones going after the Martian prime minister. The command ship put out a message.” She looked up at him. “It’s for you.”

Naomi’s voice on the hand terminal was thin and tinny and like waking up from a nightmare into something worse. “If you receive this, please retransmit. This is Naomi Nagata of the *Rocinante*. Message is for James Holden. The software controlling the magnetic bottle has been sabotaged. Do not start the reactor—”

She kept talking, but Holden already had his hand terminal up. His knuckles ached, and he had to force himself to stop squeezing the device. He put out a connection request to Drummer. His heart beat against his ribs and he felt like he was falling, like he’d stepped off a tower and hadn’t quite caught the ledge on the way down. Monica was cursing quietly under her breath. It sounded like prayer.

If the reactor came up and the bottle failed, the *Rocinante* would die in a fraction of a second. Tycho Station might survive. Some of it, anyway.

“Drummer here,” his hand terminal said. “How can I help you, Captain?”

“Have you started the reactor?” Holden said.

Drummer went silent for maybe half a second. It felt like years. “Yes, sir. We’re at sixty percent, and looking great.”

“Shut it down,” Holden said. “Shut it down right now.”

There was a moment of silence. *Don’t ask me why*, Holden thought.

Don't argue or ask me to explain. Please don't.

“Done. The core is down,” Drummer said. “So can I ask what this is about?”

OceanofPDF.com

Chapter Thirty-four: Alex

... Do not start the reactor without reloading the hardware drivers from a known good source. If you hear this message, please retr—”

The message cut off.

“We have to get this out,” Alex said. “We have to get that to Holden.”

“I’ll take care of it,” the captain said. “You and the prime minister need to evacuate. Right now.”

Alex looked at her, confused. Naomi was on the attack ships. The *Roci* had been sabotaged. He felt like the moment of stillness between being hit in the head and the bloom of pain. His first semi-coherent, irrational thought was *If Naomi’s with them, maybe they’re not so bad.*

“Mister Kamal?”

“No, I’m fine. It’s just—”

Prime Minister Smith looked at him, the man’s gentle, innocuous eyes seeming utterly out of place. “Does this change anything for us?”

“No,” Alex said. “I just... No. No, we should go. Wait. Bobbie...”

“Gunny Draper knows where you’re going,” Captain Choudhary said. “I’ll see she doesn’t get lost.”

They moved to the lift, the two marines before and behind them. The lift car gave Alex a moment of orientation as it pushed them down into the heart of the ship. It only took a few seconds to match velocity and go back to floating, but it was enough of a cue that his mind made one direction into down, the other into up. The lift car was wide enough for three times the load. The marines took stations at the door, ready to face danger if there was any. The prime minister took a place at the side near the front, where there was a little cover. No one commented on it. It was just a thing that happened. The dynamics of political power as positions in an elevator.

Naomi was here. *Right* here. Maybe less than ten thousand kilometers

away. It was like he'd turned a corner and she was there. Except, of course, that she wasn't. Even close-quarters battle meant distances that were vast in any other context. If the ship had been transparent, the enemy vessels would only have been visible by their drive plumes—dots of light in a sky filled with them. The *Pella* could be as far from him right now as Boston was from Sri Lanka, and it would still be almost intimate in the vast scale of the solar system.

"You're thinking of your friend," Smith said.

"Yes, sir," Alex said.

"Do you know why she would be on the *Pella*?"

"I don't know why she wouldn't be on the *Rocinante*. And no offense, but I'm wondering why I ever got off my ship too. Longer I'm away, the worse an idea leaving it turns out to have been."

"I was thinking the same about my house," Smith said.

One of the Marines—taller, and with a slushy accent that Alex couldn't place—nodded. "You should take cover, sir. We're going to have to pass through some territory we might not control."

He meant that the enemy had already cut off the path between them and the hangar. Alex pressed himself against the wall that the prime minister hadn't claimed and braced. The lift slowed, what had been down became up, then even that gentle gravity went away again. The marines stepped back, raised their weapons, and the doors opened. An eternal half second later, they moved out into the corridor, Alex and the prime minister following.

The corridors of the ship were empty, the crew strapped in their couches for the battle or else on the move elsewhere, keeping these halls safe while the four of them moved down them. The marines took turns moving forward from doorway to intersection to doorway. The distance behind them grew greater with every little jump, and Alex was deeply aware of the doors they'd passed that could open without any guards between him and whoever came out. The marines didn't seem worried, so he tried to take comfort in that.

The halls had the same anti-spalling covering that the bridge and the mess had had, but marked with location codes and colored strips that would help navigate the ship. One line was deep red with HANGAR BAY written in

yellow Hindi, English, Bengali, Farsi, and Chinese. Where the red line went, they followed.

They went quickly and quietly and Alex was almost thinking they'd make it to the bay without trouble when the enemy found them.

The ambush was professional. The slushy-voiced marine had just launched forward when the firing started. Alex couldn't see where it was coming from at first, but he braced automatically and risked looking forward. At the intersection ahead of them, he caught the flare of muzzle flashes and the small circle of helmets. The attackers were standing on a bulkhead looking up the corridor, like they were shooting into a well. Even if he'd had a gun, there was a very small area to target.

"We're taking fire," the other marine said, and it took Alex a quarter second to understand he wasn't talking to them. "Tollivsen's shot."

"Still in the fight," the slushy accent shouted.

Across the corridor from Alex, Prime Minister Smith was huddled behind the lip of a doorway. Most civilians tried to press against the wall and ended up launching themselves into the middle of the firing lines. Smith hadn't done that. So score one for training.

Another burst of fire sang past, tearing long black strips from the walls and deck and filling the air with the smell of cordite.

"Oyé," one of the attackers called. "Hand up Smith y we let you go, sa sa?"

The first marine fired three rounds in fast succession, and the attackers' laughter followed it. Alex couldn't be sure, but he thought the people firing at him were wearing Martian military uniforms and light armor.

"Hey!" Alex called. "We're not going to be any good to you dead, right?"

There was a lull, like a moment of surprise. "Hoy, bist tu Kamal?"

"Um," Alex said. "My name's Kamal."

"Knuckles' pilot, yeah?"

"Who's Knuckles?"

"Pinché traitor's who," the voice said. "You get to hell, tell her Salo sent you."

"Grenade incoming," the slushy-voiced marine said, his voice weirdly calm. "Employing countermeasures."

Alex turned his face to the wall and pressed his hands to his ears. The

shock of the explosion was like being slapped all across his side. He fought to breathe. Flecks of something like snow swirled through the air, and the stink of plastic and spent explosive was thick enough to choke. The stutter of gunfire seemed to come from far away.

“Grenade mitigated,” the marine shouted. “But we could use some backup here.”

The prime minister had a bright line of red across the backs of his hands, blood soaking into the white of his cuffs and floating in tiny dots through the air of the hallway. Alex felt the wall shudder under his hand as something on the ship detonated too far away to hear. Someone at the head of the corridor was laughing and whooping something in Belter chatter too fast to follow. Alex ducked his head out and back again, trying to get a glimpse of the corridor ahead. A crackle of gunfire drove him back into his shallow cover.

The laughter ahead of them turned to screams, the sharp, flat reports of gunfire into something deeper and more threatening. The marines opened fire, and the corridor rose to pandemonium. A body cartwheeled by, limp and dead, its uniform sopping up blood from a dozen wounds. Alex couldn’t tell which side the fighter had belonged to.

The gunfire stopped. Alex waited a long moment, ducked his head out and back again. Then leaned out for a longer look. The intersection where the enemy had been was misty with smoke and blood and the anti-grenade countermeasure. Two bodies floated in the middle space, one dead in light combat armor, the other in full marine recon gear. The power-armored figure lifted its hand in the sign for all clear.

“We cleaned that up for you,” Bobbie called, her voice seeming to come from miles away and with all the treble stripped out. “You can come on up. Might want to hold your breath through here, though. There’s some particulates.”

Alex pulled himself forward, the prime minister following close behind. They passed Bobbie and four new marines that swelled their escort to six. He hadn’t seen Bobbie in armor since the fight on Io. With the other marines around her, the massive armor adding to her normal bulk, she seemed at home. And more than that, she seemed wistful, knowing that it was an illusion.

“Looks good on you, Draper,” Alex called as he passed. Half-deafened

by the firefight, he only felt the words in his throat. Bobbie's smile told him that she'd heard them.

In the hangar, the *Razorback* hung in clamps built to accommodate ships much larger than she was. It was like seeing an industrial lathe with a toothpick in it. The flight crew hung on to handholds around it, gesturing Alex and Bobbie and the prime minister on. By the time Alex got to the ship, the massive hangar doors were already starting their opening cycle. The flight chief was pushing a vacuum suit at him and shouting so he could hear her.

"We're coordinating with fire control. The PDCs'll try to get you a clear run, but be careful. You run into our own rounds, and that'd just be sad."

"Understood," Alex said.

She gestured toward the hangar doors with her chin. "We're not taking the time to evacuate the bay completely, but we'll get you down to maybe half an atmosphere. Little bit of a pop, but you shouldn't spring a leak."

"And if I do?"

She held out the environment suit again. "You'll have some bottled air to suck on while you figure something out."

"Well, not a great plan, but it's a plan."

"Imperfect circumstances," the flight chief agreed.

Alex shrugged the suit on as the prime minister, already wearing his, slipped into the pinnace and toward the back bunk. The *Razorback* was a yacht. A hot rod, made for zipping around outside an atmosphere, the philosophical descendant of ships that didn't lose sight of the shore. And more than that, she was old. The girl who'd first flown her had been dead or something stranger for years, and the ship had been old before she went. Now they were going to fly it through an active battle zone.

He checked the last of the seals on his suit, and started for the *Razorback*. Bobbie was in the entry, looking in. When she spoke, it was through the suit radio.

"We've got a little problem, Alex."

He squeezed in beside her. Even before she'd been in combat armor, Bobbie had made the interior of the ship seem a little undersized. Looking from her to the second couch now, she made it look ridiculous. There was no way she was going to fit.

"I'll have them stop the launch sequence," Alex said. "We can get you in

a normal EVA suit.”

“There are boarders on the ship. Looking for us. For him,” Bobbie said. “There isn’t time.” She turned to look at him. On the other side of the helmet, her expression was rueful. “I’m only seeing one option here.”

“No,” Alex said. “You’re not staying. I don’t give a shit. I’m not leaving you behind.”

Bobbie shifted, her eyes wide. “What? No, I meant take out the couch and use the suit motors to brace me. Did you think I was—”

“That. Do that. Now,” Alex said.

Bobbie leaned forward, the magnetic boots locking onto the deck of the *Razorback*, and one hand clamped against the frame. With the other, she gripped the base of the crash couch and lifted. The bolts sheared off like she was tearing paper, and she tossed the couch out into the hangar. The gimbals shifted and turned under the spin. Bobbie scuttled in, pressing hands and feet against the walls and deck and pushing until the suit was wedged in as solidly as if it had been part of the superstructure.

“Okay,” she said. “I’m good.”

Alex turned back to the flight chief. The woman saluted him, and with his heart in his throat he returned it. The marines who’d escorted them—who’d risked their lives to get them this far—had already gone. Alex wished he’d thought to thank them.

“I’ll get to my station, and then we’ll get you out,” the flight chief said. “You be careful out there.”

“Thank you,” Alex said. He pulled himself into the ship, closed the hatch, and started running through the checklist. The reactor was hot, the Epstein drive showing green across the board. Air and water were at capacity, and the recyclers ready. “You in place back there, sir?”

“Ready as I’m likely to get,” the man replied.

“You hang on tight,” Alex said to Bobbie. “This might get rough, and you’re not in a crash couch.”

“Yeah I am,” she said, and he could hear the mischievous grin in her voice. “I’m wearing mine.”

“Well,” Alex said softly. “Okay, then.”

The clamp lights went from engaged to warning to open, and the *Razorback* was on the float. Emergency Klaxons sounded, the noise softened by the thinned atmosphere, and the massive hangar door began to

open. The change in exterior pressure rang the pinnace like a hammer blow. Alex aimed for the widening gap full of darkness and stars, and hit it. The *Razorback* leaped out into the vacuum, eager and hungry. The display marked a dozen ships too small for his naked eye to see, and the long, curving shapes of PDC fire like tentacles waving through the void.

“Taking control of the comm laser,” Bobbie said.

“Roger that,” he said. “This is going to get bumpy.”

He threw the *Razorback* out the hangar doors at full speed and into the narrow lane between the battleship’s PDCs firing on full auto. He spun the pinnace between the lines of high-velocity tungsten, hoping they were enough to stop any missiles the ambushing ships fired at them from point-blank range. And then, from behind them, fast-moving bogies in wave after wave. The *Razorback*’s display turned into a solid mass, the density of the missile swarm too much for the screen to differentiate between them. The entire arsenal of the battleship launched all at once, and keyed to target on the pinnace’s comm laser frequency.

“We’ve got our escort,” Alex said. “Let’s get out of here. How many gs can you take back there, Draper?”

“If I break a rib, I’ll let you know.”

Alex grinned, spun the pinnace toward the sun, and accelerated—two g, three, four, four and a half—until the system started complaining that it couldn’t inject him with anything through the EVA suit. He hit the suit’s crude helmet controls with his chin and injected himself with all the amphetamine it had in its tiny emergency pack. The enemy ships seemed unsure what had just happened, but then they began to turn, thin red triangles on the display. Exhaust plumes competed with the stars behind him as he fell toward the sun, toward Earth and Luna and the rattled remnants of the UN fleet. Alex felt a bloom of joy welling up in his chest, like shrugging off a weight.

“You can’t take the *Razorback*,” he said to the tiny red triangles. “We are gone and gone and gone.” He switched the radio to general. “How’s everyone doing back there?”

“Fine,” the prime minister gasped. “But will we be accelerating like this for much longer?”

“Bit longer, yes, sir,” Alex said. “Once we get some breathing room, I’ll cut us back to just a g.”

“Breathing room,” the prime minister said, the words labored. “That’s funny.”

“Five by five here, Alex,” Bobbie said. “Is it safe to pop my helmet? I’d rather not run through all my bottled air when there’s fresh in the ship.”

“Yeah, that’s fine. Same back there, Mister Prime Minister.”

“Please. Call me Nathan.”

“You got it, Nate,” Alex said. The sun was a sphere of white. He pulled up the nav computer and started plotting in paths to Luna. The fastest would take them inside the orbit of Mercury, but the pinnacle wasn’t rated for more than half an AU from the coronal surface. So that was going to be a little tricky. And Venus wasn’t anyplace that he could gracefully use to slingshot. But if Avasarala was sending out an escort to meet them, she might be able to get a boost off the planet. So heading that direction might make sense.

“Alex?” Bobbie said.

“I’m here.”

“That thing about not leaving me behind? You really meant that, didn’t you?”

“Of course I did.”

“Thank you.”

He felt a blush rising even against the pressure of the burn. “Welcome,” he said. “I figure you’re crew now, right? We look out for each other.”

“No soldier left behind,” she said. It might have been the gs, but something about her tone made it sound like she meant something deeper by the words. Like she’d made a promise. She grunted. “Alex, we’ve got fast-movers coming in. I think the bad guys are throwing missiles at us.”

“You ready to disappoint them, Gunny?”

“Oh hell yes,” Bobbie said. “How many bullets have we got in this magazine?”

Alex switched the display. The cloud of escort missiles resolved into a numbered list, all in white with identifying serial numbers beside each of them. Even the list filled the screen. He switched to a field summary. “A little shy of ninety.”

“That should get us where we’re going. Looks like pretty near all their ships are burning hard for us too. How would you feel about taking a few potshots at them by way of discouragement?”

“It’ll keep them at a distance, anyway. I figure their PDCs’ll probably

take them down before they can do any real damage, but apart from that I'm not opposed," Alex said. "Except... hold on." On his list, he switched to the enemy flotilla. It took him a few seconds to find what he was looking for. He marked the *Pella*. "Not that one. We don't shoot that one."

"Understood," Bobbie said.

No soldier left behind, Alex thought. That goes for you too, Naomi. I don't know what the hell's going on out there, and I don't see how this plays out yet. But I'll be damned if I'm just leaving you behind.

Chapter Thirty-five: Naomi

Back before, when she had been a girl and not known any better, it had been hard for her to cast Marco as the bad guy in their pairing. Even after the *Gamarra*, it had been difficult. Even after he'd taken Filip away. She'd grown up around poverty. She knew what bad men looked like. They raped their wives. Or beat them. Or their children. That was how you knew them for what they were. Marco was never that. He never hit her, never forced himself on her, never threatened to shoot her or throw her out an airlock or pour acid in her eyes. He'd pretended kindness so well she would doubt herself, make herself wonder if she was the one being unreasonable, irrational, all the things he implied she was.

He never did anything that would have made it easy for her.

After she'd reached her quarters, the door had locked. She hadn't bothered trying to raise help or leave her little room since. She knew a cell when she was in it, and she'd known with a certainty like her own mortality that sooner or later, Marco would come.

He sat across from her now, still in his Martian military uniform. His eyes were soft, his lips pressed into a smile of amusement and regret. He looked like a poet. A man well bruised by the world, but still capable of passion. She wondered if he practiced the expression in a mirror. Probably, he did.

The wound on her head had stopped bleeding. Her joints all ached, and a vast bruise was blooming on her left hip. Even her fingertips felt like she'd scraped the first layers of skin off them, leaving them weeping and raw, though actually they just looked a little pinker than usual. She drank the same version of chamomile tea that the *Rocinante* made, and it felt like having a secret ally. She recognized that wasn't a perfectly sane thought,

but comfort was comfort.

The mess was empty, the screens turned off and the crew sent away. Even Cyn and Karal were absent. The implication was that whatever they said there was private, but it probably wasn't. She could imagine Filip on another deck, watching. It felt like a setup. Everything about Marco felt like a setup. Because everything was.

"I don't know why you do these things to me, Naomi," Marco said. There was no anger in his voice. No, that wasn't true. The anger was there, but hidden behind the mask of disappointment. "You used to be better than this."

"I'm sorry. Did I upset your plans?"

"Well, yes," Marco said. "That's the thing. Used to be, you knew better. Used to be you at least tried to understand what was going on before you jumped in. Professional. This, though? Took a difficult thing and made it worse. Now what could have been gentle is going to be hard. I just want you to understand why I'm going to do what I'm going to do so you see I didn't have a choice."

There was a smart thing to do. She knew it. A wiser woman would have cried, begged forgiveness. That it would be insincere was the point. It was a mistake to give Marco anything real. Better to be thought weak. Better to be underestimated and misunderstood. She knew that, but she couldn't do it. When she tried, something deep within her pushed back. Maybe if she pretended to be weak, it was too possible that it would become true. Maybe she was pretending to be strong.

Naomi spat on the deck. There was a little blood along with her saliva. "Save the air."

He leaned forward, taking her hand in his. His grip was strong, like he was showing that he could hurt her, even if he wasn't doing it right now. She thought, *Well, that's one way to make your subtext physical*, and then chuckled.

"Naomi, I know we aren't good, du y mé. I know you're angry. But I know we were something once. We're one body, you and me. Much as we try to be apart, our son means we will never be totally separate."

She tried to pull her hand back, but he kept hold of it. She could pull harder or let him touch her, control her body even if it was only that much. The glimmer in his eyes was pleasure. His smile was a little more genuine,

and it had an edge.

“You’ve got to understand what I’m doing here, it’s not for me. It’s for us.”

“Us?”

“Belters. All Belters. It’s for Filip. So when his turn comes, there’s still a place for him. Not just a footnote. Once upon a time there were a people who lived on moons and asteroids and the planets where life didn’t evolve. But then we found the gates, and those people died out because we didn’t need them. It’s why I have to do this. You don’t like my methods. I understand that. But they’re mine, and the cause is righteous.”

Naomi didn’t speak. The food processor let out a high whine that meant its water supply was getting low. She wondered if Marco knew that, or if it was just another meaningless noise for him.

“Pretty speech. But it doesn’t explain why I’m here. You didn’t need me here in order to break the system. Needed me for something else. You want to know what I think?”

“You told me,” Marco said, his grip on her hand tightening just a degree. “So the great James Holden wouldn’t come blow my house down. Seriously, you think too much of him. He’s not that impressive.”

“No, it’s worse than that. I think you wanted the *Roci*. I think you wanted my ship flying at your side when you did all this. But when I didn’t bring her, you fell back. Had Sakai rig her to blow. Because there is nothing original about you at all.”

His smile was as warm, but his eyes were cold now. Unamused. “Don’t follow,” he said.

“You start the conversation with *Why do you make me hurt you when I love you so much?* and now we’re at *If I can’t have you, no one can*. You can pretend we’re talking about the ship if you want. Doesn’t matter to me.”

Marco let her go and stood. He wasn’t as tall as she remembered him. “You got it wrong from the start. I wanted Fred Johnson—Butcher of Anderson Station, who killed people like you and me and Filip just because we were Belters. I wanted him isolated. Keep your ship out of his hands. Tried to get it brought, but no. Had Sakai try to disable her. *Disable*, sa sa? Had it rigged to blow at three percent power. Blown off her aft, maybe didn’t even hurt anyone.”

“I don’t believe you,” she said, but he was on a roll now, pacing the

length of the mess, his arms spread wide like a man giving a speech to an invisible crowd.

“Killing the ship wasn’t my plan. That’s what *you* pushed me into. What happens to Holden is your fault, not mine. That’s what you need to see. How things get worse when you start acting like you know. You don’t know, Naomi. You don’t know because I haven’t told you.”

She took a sip of her tea and shrugged. “So tell me.”

Marco grinned. “You notice when we cut thrust for a few minutes? Strange thing to do in the middle of a chase, don’t you think?”

The truth was, she hadn’t noticed. In her bunk, nursing her wounds, the shifts in ship gravity hadn’t been on her mind.

“Docking procedure,” he said and pulled his hand terminal from his pocket and chose something. The speakers on the screens clicked, hissed. No image appeared on them, but a voice came.

Her voice.

“This is Naomi Nagata of the *Rocinante*. If you get this message, please retransmit. Tell James Holden I am in distress. Comm is not responding. I have no nav control. Please retransmit.”

Marco touched something else on his hand terminal, and the screens sprang to life. Exterior cameras, probably connected to the point defense. The *Chetzemoka* burned not more than a hundred meters away, a docking tube clinging to her airlock like an umbilical cord. A ship that, if they dug hard enough, would trace back to her. The payments that had come from her accounts.

“Put it on intersecting course, more or less,” Marco said, his voice weary and sorrowful in a way she was certain hid glee. “Set the bottle to fail when the proximity sensors ping a ship. Didn’t have to be this way, but it does now.”

A real despair rose up in her throat, and she pushed it back down. It was what Marco wanted, so she would do *anything*, feel *anything* except that. She considered the screen. The ship looking like a box held together with one line of solder and some epoxy.

“You’re stealing it from your own son,” she said. Marco frowned. Naomi pointed toward the screen with her chin. “The *Chetzemoka*. I told Filip he could have it when we were here. That’s his ship. You’re stealing it from him.”

“Necessity of war,” Marco said.

“Shitty parenting.”

His jaw slid forward. His hands balled in fists. For a moment, she thought he was going to make it easy. He’d show whatever audience he was playing for who and what he really was. He got his temper back in time, and she wasn’t sure if she was relieved or disappointed.

“If you’d stayed in your place, James Holden would have lived. But you stepped out. Put yourself where you didn’t belong. Because of you, he’s going to die.”

Naomi stood up, rubbed her eye with the back of her hand. Her false voice repeated through the mess hall—“Tell James Holden I am in distress...”

“Anything else?”

“You pretend you don’t care,” Marco said. “But you do.”

“You say so.” She shrugged. “I got a little bump. It’s giving me a headache. Or something is. Going to med bay get it fixed, yeah?”

“You can pretend—”

“Can I pretend in the med bay? Or do you need to go on impressing me?” It was too much. She felt a flood of words hammering up behind all she’d said. *You are an egomaniac and a sadist and I can’t believe I ever thought I loved you and If Jim dies, I will by God find a way to make the bottle on this ship fail and we’ll all go to hell behind him.* But engaging was also a trap, so she didn’t. She let the silence break the rhythm of Marco’s performance and saw his shoulders shift when he gave up and stepped off the stage in his head.

“Miral!” he yelled, and as the sounds of one of the crew moving from the quarters grew louder, “You abused the freedom I gave you. You can’t expect to keep it.”

“Too dangerous to leave free?” she asked, then licked her fingertip and ticked off a mark on an imaginary board. “One point for me, then.”

In the med bay, a woman she didn’t know ran tests to make sure Naomi wasn’t bleeding in her brain; that none of the bruises she had were crush wounds bad enough to kill the muscle, flood her body with potassium, stop her heart. Miral leaned against the supply cabinet, reciting obscenities—bitch, puta, cunt—with a half-focused rage. After spending all those days running inventory, Naomi knew everything in the cabinet. First drawer:

gauze and bandages. Second drawer: one-use blood cards for maybe a hundred different field tests. Third drawer: emergency medical supplies like decompression kits, adrenaline shots, defibrillating tape. Naomi stared at Miral as he recited his litany. He glanced away, and then returned the stare, enunciating each word a little more sharply.

The medic had her sit up, the cushion of the medical table crackling under her shifting weight. The analgesic was a spray that went in Naomi's mouth. It tasted like fake cherry and mold.

"Maybe take it easy for a couple days, yeah?" the medic said.

"Best I can," Naomi agreed, hopping down from the bed. She straight-kicked Miral in the crotch, sending him sprawling into the cabinet and cracking two of her toes. She ignored the stab of pain in her foot and launched herself onto him, pounding at his head and neck. When he rolled, she rolled with him. The cabinet doors were open, spilling test cards and preloaded hypodermics across the floor. Miral's elbow swung up, glancing off her jaw but still hard enough to make her ears ring.

She fell to the side, her belly to the deck, decompression kits the size of her thumb pressing into her face as Miral writhed around to kneel on her back. The medic was screaming. Naomi tried to turn, tried to evade the punches, but she couldn't. The pain bloomed between her shoulder blades. And then, like time skipping, the weight was off her. She rolled to her side. Karal had Miral in a submission hold. He struggled and cursed, but the old Belter's eyes were flat and dead.

"Be angry con sus séra that she got you unexpected," Karal said. "Marco pas beat her down, you sure as fuck don't, sabe pendejo?"

"Sa sa," Miral said, and Karal let him go. The medic, standing in the corner, was a picture of silent rage. Miral rubbed his neck and glared at Naomi where she still lay on the deck. Karal walked over to look down at her.

"Bist bien, Knuckles?"

She nodded, and when Karal put out his hand, she took it and let him help her up. When she started for the door, Miral began to follow. Karal put a hand on the man's chest. "I got this, me."

Naomi hung her head as they walked, her hair falling over her face like a veil. The steady pressure of acceleration left her knees and spine aching even more than her wounds. All through the ship, malefic faces turned to

her. She could feel the hatred coming off them like heat from a fire. When she passed through the mess, the *Chetzemoka* was still on the screen, the docking umbilical linking them. They'd need to cut thrust when they unhooked it, or it would fall to the side, trailing along the ship like a limp tentacle. That would be how she knew she was too late. It hadn't happened yet.

At her quarters, Karal came in behind her and closed the door. With two of them in the tiny space, it felt cramped and uncomfortably intimate. She sat on the crash couch, arms crossed, her legs tucked under her, and looked at him, her expression carrying the question. Karal shook his head.

"You got to stop this, Knuckles," he said, and his voice was surprisingly gentle. "We're in king shit here. Esá la we're doing? History, yeah? Changing everything, but for us this time. I know you and him ain't right, but tu muss listen him. Yeah?"

Naomi looked away. She just wanted him to leave, but Karal didn't go. He sank down, his back against the wall, his knees to his broad chest.

"I heard the plan where we gehst con du? Bring you in? Fought it, me. Mal cóncep, I said. Why cut open the scar? Marco said was worth it. Said you were going to be in danger when it all came, and Filip, he deserved to see his mother, yeah? And Marco's Marco, so si."

Karal rubbed his palms over his head. It made a soft hissing sound, almost too faint to hear. Naomi felt an inexplicable urge to touch him, to offer some comfort, but she didn't. When he spoke again, he sounded tired.

"We're little people in big times, yeah? Time for Butchers and Marco—men and history-book things. Other pinché worlds. Who wants that? Just you let this pass, yeah? Maybe your Holden, he doesn't take the bait. Maybe something else trips before he gets here. Maybe you get small and you live through this. That so bad? Doing what needs to live through?"

She shrugged. For a time, the only sound was the clicking of the air recycler. Karal lifted himself up with a grunt. He looked older than she thought of him. It was more than just the years, she thought. For a moment, she was young again, back on Ceres with Filip bawling in his crib while she watched the news of the *Augustín Gamarra*. It occurred to her for the first time that everyone on that ship had watched Earth die in real time the way she'd seen the firefly light of the *Gamarra* rise and fade on the newsfeed, looped a dozen times while the reporter spoke over it. She wanted to say

something, but she couldn't, so she just watched as Karal opened the door then closed it behind him. The lock slid closed. She wiped the wet from her eyes, and—once she was sure he wasn't coming back—spat the decompression kit into her hand.

Wet with her saliva and no bigger than her thumb, it was the sort of thing any mech driver kept with her. A tiny ampoule of injectable oxygenated artificial blood, and a panic button that would make an emergency medical request for an airlock to cycle. Military ships like the *Pella* and *Roci* ignored that sort of request as basic security. The *Canterbury* and other commercial ships usually allowed it, filled as they were with civilians who posed a greater threat to themselves than pirates or boarders did. She didn't know how the *Chetzmoka* would respond to it, but there was only one way to find out. The only other things she needed were an EVA suit and a clear idea of when the ships would cut thrust.

Then it was a matter of taking control of the ship, maybe blowing the core, and getting the hell away from Marco. Again. She felt a pang of regret at the thought of Filip—and Cyn and Karal and all the people she'd known once and cared for. Even loved. It was an echo of greater pain, and she could ignore it.

"Didn't break me when I was a girl," she said to the tiny black kit. "Don't know why he thinks he can break me now."

Chapter Thirty-six: Holden

Holden wanted badly to sleep, but sleep wouldn't come. The most he'd been able to manage was a few hours' unconsciousness that left him groggy and ragged. He'd been given the option of moving back into quarters on the station, but he'd refused. Even though he slept better with gravity holding him to the mattress, he didn't want to leave the ship. He wasn't sure how long it had been since he'd shaved, but the patchwork of stubble on his cheeks and neck itched a little. During the work shifts, it wasn't so bad. The new crew checked the systems they'd all checked before, looking for sabotage they hadn't seen last time, and it gave him something to do. People to talk to. When they left, he ate in the galley, tried to sleep for a while, then wandered through the ship like he was looking for something but couldn't remember what it was.

And then, inevitably and against his better judgment, he checked the newsfeeds.

"With the silence from Medina Station, all contact with the colonial planets has been lost. We can only speculate on the significance of the partial report from the Fólkvangr settlement concerning alien activity in the southern hemisphere of New Triton—"

"A spokesman for the port authority said that Ganymede's neutrality was a reflection of its universal importance and not a political statement—"

"UN forces are en route, but it is not clear whether Prime Minister Smith is actually aboard the racing ship or if this is a distraction to pull the enemy's attention away from a more traditional evacuation. Regardless, acting secretary-general Avasarala has announced a security zone covering the flight path of the pinnacle, and all ships in the area have been advised to move beyond weapon range until such time as—"

Light speed, he decided, was a curse. It made even the farthest corners of humanity's reach feel close, and the illusion was a kind of poison. The delay between Tycho Station and Earth was a little less than a quarter of an hour, but to travel that far would take days. If Alex or Naomi died, he could know within minutes that they were gone. He floated in his restraints, the cabin lights turned off, and flipped through the feeds, jumping back and forth in case anything had happened, knowing that if it had, there was nothing he could do. He felt like he was standing on a frozen lake, looking down through the ice while the people he cared about most drowned.

If he couldn't know, if everything that was happening could happen someplace he couldn't watch, then maybe he could look away. Maybe he could close his eyes and dream about them, at least. When a connection request came on his hand terminal, he was glad to get it.

"Paula," Holden said.

"Holden," the hacker replied. "Wasn't sure what schedule you're on. I was afraid I was calling in your sleep shift."

"No," Holden said. He didn't know why he felt defensive about being awake, but he did. "It's fine. I'm fine. What have you got?"

She grinned. "I have a smoking gun. I can transmit a report to you—"

"No. I mean, yes. Do that. But am I going to understand what I'm seeing?"

On the screen, she stretched, grinning. "I was about to head out to dinner. Meet me at La Fromagerie and I'll walk you through the whole thing."

Holden pulled up the station directory. It wasn't far. If Naomi died right now, the news would reach him just about when he got there. Maybe before. He pressed his palm against his sandpaper-dry eyes. "Sounds like a plan," he said.

"Meal's on you."

"You've got me over a barrel, yeah, yeah. Be right over."

The restaurant was small, with what appeared to be real wooden tables but were certainly pressed bamboo from station hydroponics; no one charging even vaguely reasonable prices for the meals would have been able to afford something from an actual tree. Paula was at a table against the wall. The bench she sat on looked normal for her. When he sat across from her, his feet didn't quite touch the deck.

“Boss,” Paula said. “I already ordered.”

“I’m not hungry. What have you got?”

“Take a look,” she said, passing her hand terminal over to him. The screen was filled with a structured scatter of code, structures nested inside structures with repeated sections showing variations so subtle as to approach invisibility. It was like seeing a poem written in an alphabet he didn’t know.

“What am I looking at?”

“These two lines,” she said. “This sends the stop code to the bottle. These are the conditional statements that call it. For you, if you’d gotten to ninety-five percent, you’d have been a star. If you’d been in dock, which you probably would have, it would have taken a fair bite out of the station too.”

“And the new software? The one that the ship’s running now?”

“Not in it,” Paula said. “This is where you get to be impressed with me finding two lines of uncommented code in a fusion reactor’s magnetic bottle driver.”

“Very impressive,” Holden said, dutifully.

“Thank you, but that’s not the cool part. Take a look at the trigger line. You see all those calls set to null? They’re all other system parameters that weren’t being used.”

“Okay,” Holden said. From the brightness in her expression, he had the sense he should have seen something more in her words. Maybe if he’d been able to sleep...

“This is an all-purpose trap. You want something to blow when they’ve been out of port for six days? Set that call there to about half a million seconds. You want it to go when the weapons systems are armed? This call right here set to one. There’s maybe a dozen different ways to set this thing off, and you can mix and match them.”

“That’s interesting—”

“That’s a smoking fucking gun,” Paula said. “Bottle containment failures don’t leave much by way of data. Not supposed to happen ever, but sometimes they do. The story has always been that accidents happen, what can you do? Ships blow up sometimes. This shows that someone built a tool specifically to make it happen. And to make it happen again and again and again, wherever they could sneak their code into the ship they decided had

to die. What we have here is key evidence in maybe thousands of murders no one even knew *were* murders until right now.”

Excitement tightened her voice, brightened her eyes. The unease in his gut grew thicker.

I need to go do something, Naomi said in his memory. *And I can't have you involved in it. At all.*

Was this it? Was this what she'd been trying to keep separate from him, from the *Rocinante*? And what did it mean if it was? Paula was still looking at him, expectation in her eye. He didn't know how to respond, but the silence was getting awkward.

“Cool?” he said.

Fred was sitting at Drummer's desk, his elbows resting on the tabletop, his hands cradling his chin. He looked as tired as Holden felt. On the screen, Drummer and Sakai were in one of the interrogation rooms. The table that was usually between them had been moved askew, and Drummer was leaning back in her chair and resting her feet on it. Prisoner and guard were both drinking what looked like coffee. Sakai laughed at something and shook his head. Drummer grinned impishly. She looked younger. Holden realized with a start that she was wearing her hair down.

“What the hell is this?” he asked.

“Professionalism,” Fred said. “Building rapport. Establishing trust. She's halfway convinced him that whoever he was working for was willing to crack the station open with him still inside it. Once he's come around, we'll own him. That man will tell us everything we ask and then try to remember something we didn't think to dig for if we give him time. No one's as zealous as a convert.”

Holden crossed his arms. “I think you're overlooking the beat-him-with-a-wrench stratagem. I favor it.”

“No you don't.”

“In this case, I'd make an exception.”

“No. You wouldn't. Torture's for amateurs.”

“So? I don't do this professionally.”

Fred sighed and turned to look up at him. “The reckless tough-guy version of you is almost as tiring as the relentless Boy Scout was. I’m hoping your pendulum swings hit middle sometime soon.”

“Reckless?”

Fred shrugged. “Did you find anything?”

“Yeah,” Holden said, “but it’s not in the fresh driver. We have a clean bill of health.”

“Unless there’s something else.”

“Yup.”

“Sakai says there wasn’t.”

“Not entirely sure I know how to respond to that,” Holden said. Then, a moment later, “So, I’ve been thinking.”

“About the message from the *Pella*?”

“Yeah.”

Fred stood up. His expression was hard, but not without compassion. “I was expecting this fight, Holden. But there’s more at stake here than Naomi. If the protomolecule is being weaponized, or even just set loose again—”

“That doesn’t matter,” Holden said. “Wait, no. That came out wrong. Of course that matters. It matters a lot. It just doesn’t change anything. We can’t...” He paused, swallowed. “We can’t go after her. I’ve got one ship, they’ve got half a dozen. Everything in me wants to fire up the engines and burn like hell after her, but it won’t help.”

Fred was silent. The distant sound of Sakai’s laughter filtered through from the screen. They both ignored it. Holden looked at his hands. He felt like he was confessing something. Maybe he was.

“Whatever’s going on here?” Holden said. “Whatever she’s involved with, I can’t fix it by putting on my shining armor and riding into battle. The only way I can see to do her any good at all is to do what we had planned. Get you to Luna. If you can use Dawes and Sakai and Avasarala to open some kind of communication with these sons of bitches, Naomi can be a bargaining chip. We can trade her for some of the people you’ve got in the brig. Or Sakai. Or something.”

“That’s the conclusion you’ve reached?”

“It is,” Holden said, the words tasting like ashes.

“You’ve grown up some since the first time we met,” Fred said. Holden

heard the sympathy in it. The consolation. “It’s making me regret my ‘reckless’ comment.”

“I’m not convinced that’s a good thing. Have you ever done this? Loved someone like they were part of you and then left them in danger?”

Fred put a hand on Holden’s shoulder. For all the frailty that age and trouble had put in the older man’s face and body, his grip was still firm. “Son, I’ve grieved for more people than you’ve met. You can’t trust your heart on this. You have to do what you know, not what you feel.”

“Because if I do what I feel...” Holden said, thinking that the end of the sentence was something like *I’d beat Sakai’s teeth in* or *I’d get us all killed*. Fred surprised him.

“Then we lose her.”

“Course set,” Chava Lombaugh said from the cockpit. “On your order, sir.”

Holden tried to lean back into his crash couch, but without thrust gravity to give him weight, it ended up as just a straightening of the neck. His heart was racing, adrenaline ticking coolly through his veins.

It wasn’t supposed to be like this. The command deck felt too full. Sun-yi, serious and relaxed, was at weapons. Maura had comm controls up, monitoring them because that was what she did more than from any actual need. It should have been Alex’s voice. It should have been him and Naomi in the couches.

He shouldn’t have been scared.

“All right,” he said. “Let’s do this.”

“Sir,” Chava said. The warning light went from amber to red and Holden fell back into his couch. Tycho Station fell away behind them. It wouldn’t be an hour before it was too small to make out without assistance. Holden waited for three long, shuddering breaths. Four.

“How are we looking, Mister Ip?”

From the engineering deck, Sandra Ip—who should have been Amos—said, “All systems are within tolerance.”

“Meaning not all blowed up,” Holden said.

There was a pause on the channel. “Yes, sir. Not all blowed up, sir.”

Holden hated it that he wasn't sure of his own ship. The *Rocinante* had been nothing but solid for him since the day he'd gotten aboard her. He'd trusted the ship with his life the way he trusted his heart to beat. It was more than instinct. It was automatic. To do anything else would have been strange.

But that was before. Sakai's sabotage hadn't killed him, but it hadn't left him unscathed either. It would be a long time before Holden was sure that there were no more unpleasant surprises hidden in the ship. Software waiting for the right moment to evacuate the air or throw the ship into a fatal acceleration or any of the other thousand ways a ship could fail and kill its crew. They had looked everything over and found nothing, but they'd done that before and nearly died from their oversights. There was no amount of double-checking that would ever prove that nothing had been missed. From now on—maybe for a long time, maybe forever—he would wonder about things he hadn't before. He was resentful, even angry, that his faith had been shaken.

He wondered if he was still thinking about the *Rocinante*.

"All right," he said, unstrapping. "I'm going to get some coffee. You folks try not to break anything, and if you do, let me know."

The chorus of yessirs was oddly disheartening. He wished they'd known he was joking. Or felt comfortable enough to joke back. Their formality was just another way it didn't feel like his ship anymore.

He found Fred in the galley, talking into his hand terminal, recording a message that was clearly meant for Anderson Dawes. Holden got his coffee quietly between phrases like *lines of communication* and *profound lack of trust*. When Fred finished, he folded his hands and looked over.

"I'd take one of those too. Cream, no sugar."

"Coming up," Holden said. "Anything new?"

"Two of the original Martian escort surrendered."

"Seriously?"

"They were too far from the action to affect the outcome, and they were getting hammered. I don't like it, but I won't second-guess their command."

"Is it just my imagination, or are these people handing us our asses on a plate?" Holden said, bringing the coffee mugs to the table. "Are they really this good, or do we all just suck a lot worse than I thought we did?"

Fred sipped the coffee. "Ever heard of the Battle of Gaugamela?"

“No,” Holden said.

“Darius the third, emperor of Persia, had two hundred thousand soldiers under his command. Bactrians, Arachosians, Scythians. Some Greek mercenaries. On the other side, thirty-five thousand soldiers, and Alexander of Macedon. Alexander the Great. Five Persians to every Macedonian. It should have been a slaughter. But Alexander pulled so much of the enemy out to the flank that a gap opened in the middle of the Persian lines. Alexander called his men to form a wedge, and leading with his own cavalry, he pushed through and headed straight for the emperor. There were vast forces to either side, surrounding him. But it didn’t matter, because he saw how to reach Darius. Alexander saw something no one else had seen.

“These people? This little faction of the OPA? Between Earth and Mars and me, we outnumber them. We outgun them. All this has happened because someone saw an opportunity that no one else did. They had the audacity to strike where no one else would even have considered an attack. That’s the power of audacity, and if a general is lucky and strong-minded, they can take that advantage and keep the enemy on their back foot forever.”

“You think that’s their plan?”

“It would be mine,” Fred said. “This isn’t someone making a play to control the Belt or the Jovian moons. This is someone trying to grab all of it. Everything. It takes a certain kind of mind to succeed in something like that. Charisma, brilliance, discipline. It takes an Alexander.”

“That sounds a little discouraging,” Holden said.

Fred held up the coffee cup. The name TACHI hadn’t quite worn off the side, red and black letters half-erased by use. But not gone. Not yet. “I understand better now how Darius felt,” Fred said. “Having power, position, advantage. Especially when you think you know how wars work. It blinds you to other things. And by the time you see them, there’s a Macedonian cavalry with spears set coming right at you. But that wasn’t how Darius lost.”

“It’s not? Because the story you just told me sounded a lot like that’s how he lost.”

“No. He ran.”

Holden drank. From the crew quarters, the murmur of unfamiliar voices

was a reminder that things were wrong. That the patterns of the past were broken, and might never be put right. “He was going to get killed if he didn’t, though. Alexander would have killed him.”

“Maybe. Or maybe Darius would have withstood the charge. Or maybe he would have fallen and his army would have crushed Alexander’s in rage and grief. The end of an emperor isn’t always the end of an empire. I look at Earth and what happened there. I look at Mars. At what happened on Tycho, and what I’m afraid happened on Medina. I’m seeing Alexander’s wedge bursting through the line at me. The same shock as Darius, the same dismay. The fear. But I’m not Darius. And I think Chrisjen Avasarala isn’t either.”

“So you don’t think we’re screwed?”

Fred smiled. “I don’t know what to think yet. I won’t until I know more about the enemy. But looking back through history, there are a lot more men who thought they were Alexander the Great than men who actually were.”

Chapter Thirty-seven: Alex

They burned across the emptiness, and the enemy came hard behind them. Four Martian military ships with target locks on Alex's drive burned toward him as they all dropped toward the sun. The other two had stayed behind to continue the attack on the main force. More than half the attackers had peeled off to come for him. Alex hoped it was enough to let Captain Choudhary get a toehold. Nothing he could do about that from here, though, but watch and hope.

For the first few hours, it had all been hard burn and dodging. Once he'd opened up some distance between the *Razorback* and the attackers, the nature of the chase altered. It wasn't about catching or being caught anymore. Alex had the lead, had seventy-two missiles left flying around him in a cloud, a path to Luna, and reinforcements burning out to join him. If nothing went wrong, he'd be safe in less than two days.

The enemy's job now was to make something go wrong.

"You've got another couple PDC arcs coming in," Bobbie said.

"That's cute," Alex said. "I'm moving to avoid. You want to let the missiles know?"

"Already done."

The tungsten slugs of the enemy point defense cannons were meant to chew through missiles at close range. At the distances they were holding now, they were something between an invitation for the crew of the *Razorback* to blunder into them by mistake and an uplifted middle finger. Alex tracked the incoming fire and braced as the maneuvering thrusters pushed them down and to the left to avoid the gently curving arcs of enemy fire, then up and right to correct to the original course. Around him the cloud of missiles parted to let the slugs pass through their flock of exhaust

cones and warheads.

“Any enemy missiles following that up?” he asked.

A moment later Bobbie said, “Nope.”

“Keep an eye out. Our friends there are gettin’ antsy.”

“Happens when you’re losing,” Bobbie said. Even without turning, Alex could hear the smile in her voice.

From the cabin in the back, Smith’s voice came in staccato gasps. Even the relatively modest one-g flight was three times what the man was used to. He’d been burning up the tightbeam for hours. Sometimes, Alex caught Chrisjen Avasarala’s recorded voice, other times a man’s warm drawl. Someone on Mars, he figured.

The *Razorback* had been a toy once, and while the screens were decades out of date, they still had some bells and whistles. He set the wall screens to match external cameras, and the wide starscape bloomed around them. The sun was bigger and brighter here than it would have been on Earth, but constrained by the limits of the screen to a burning whiteness. The curves of the Milky Way glowed all along the plane of the ecliptic, the billions of stars made soft by distance. Being surrounded by missiles was like floating in a cloud of fireflies, and behind them, bright as seven Venuses in an Earth twilight, the drive plumes of the attackers who wanted them dead.

And also Naomi.

Bobbie sighed. “You know, a thousand of those stars out there are ours now. That’s like, what? Three ten-thousandths of a percent of our galaxy? That’s what we’re fighting over.”

“You think?”

“You don’t?”

“Nah,” Alex said. “I figure we’re fighting over who gets the most meat from the hunt and first access to the water hole. Mating rights. Who believes in which gods. Who has the most money. The usual primate issues.”

“Kids,” Bobbie said.

“Kids?”

“Yeah. Everyone wanting to make sure their kids have a better shot than they did. Or than everyone else’s kids. Something like that.”

“Yeah, probably,” Alex said. He shifted his personal screen back to tactical, pulling up the latest data on the *Pella*. It still had the strange,

cheap-looking civilian craft tethered to it. Alex couldn't tell if they were taking something off it or putting something on. So far, it was the only craft in the little force that wasn't clearly military design. There hadn't been any more contacts from Naomi. He didn't know whether that was a good thing or a problem, but he couldn't help checking on the ship every five minutes like he was picking at a scab.

"You ever worry about your kid?" Bobbie asked.

"Don't have one," Alex said.

"You don't? I thought you did."

"Nope," Alex said. "Never really had the situation for one, you know? Or I guess I did, and it didn't fit. What about you?"

"Never had the urge," Bobbie said. "The family I've got has been more than enough."

"Yeah. Family."

Bobbie was silent for a moment. Then, "You're thinking about her."

"Naomi, you mean?"

"Yeah."

Alex turned in his couch. Bobbie's armor reached against both walls, servomotors locked in place to brace her. She looked crucified. The wound in the deck where she'd pulled out the crash couch made it seem like she'd burst through the bottom of the ship. Her expression managed to be both sympathetic and hard.

"Of course, I'm thinking about her," Alex said. "She's right there. And probably she's in trouble. And I can't figure out how the hell she got there in the first place. It's not going to be too long before the cavalry gets here to save us, and when they do, I don't know if I should be helping to attack the *Pella* or protect her."

"That's hard," Bobbie agreed. "But you know we've got our mission. Get Smith to Luna. We've got to stand our watch."

"I know. Can't help thinking about it, though. I keep putting together schemes where we use the missiles we've got left to make them turn her over to us."

"Any of them even remotely plausible?"

"Not a one," Alex said.

"There's nothing worse than keeping to your duty when it means leaving one of your own in danger."

“No shit.” Alex looked at the readouts from the *Pella*. “You know, maybe—”

“Stand your watch, sailor. And heads up. We’ve got more PDCs coming in.”

Alex had already seen them and started laying in the course corrections. “Optimistic little shits. Got to give them that.”

“Maybe they think you’ll get sleepy.”

The overloading of the pinnacle was awkward and strange. Moving from the pilot’s seat to the head meant both Alex and the prime minister of Mars squeezing past Bobbie’s power armor. Or, for Bobbie, exiling Smith to the empty space where her couch had been while she used the tiny cabin to break down her armor or climb back into it. No one even suggested that they sleep by hot-bunking in the cabin.

Smith himself seemed like a personable man, polite and thoughtful. *Inoffensive* was a word that came to mind. Alex had stopped following Martian politics sometime around the slow zone, so he didn’t come in with any preconceptions about the man or his policies. When they did talk, it was usually about small things—the popular culture of Mars when they were both growing up, Smith’s gratitude for the efforts he and Bobbie were putting into keeping him alive, some questions about what Ilus had been like. Alex had the sense that Smith was, if anything, a little starstruck by him. Which was pretty thoroughly odd, when he thought about it.

Still, when Smith popped his head out of the cabin to tell Bobbie that there was a message specifically for her from Avasarala, it had the sense of a secretary who was vaguely uneasy interrupting his boss. Alex felt a weird impulse to reassure the man it was all right, but wasn’t sure how to say it without being even more awkward.

Bobbie thanked him, and for a while she was silent. Alex kept his eyes on the enemy and the sun and the data from the incoming UN escort ships that were still hidden by the sun’s corona.

“Alex?” Bobbie sounded frustrated.

“Yup.”

“I can’t make this thing’s incoming feed talk to my suit. Can you put this up on a screen for me? I’d do it myself, but—”

He switched over to the comm system, opened a panel on the wall screen, and sent the message to it. Chrisjen Avasarala appeared. She looked

older than Alex remembered her. There were dark circles under her eyes and a grayness to her skin that didn't belong there. Her sari only made her look paler. When she spoke, though, her voice was just as sure as ever.

"Bobbie, I need any data you have about the missing Martian ships. I know, you're going to tell me how you've already given me everything, and of course I trust and believe all that you say, blah blah fucking blah. But I need it. Now. I've got confirmation of two dozen Martian military vessels that are burning hard for the Ring. Everything from the *Barkeith* to a couple resupply barges. It's like a little fucking fleet all its own. Smith says he's looking into it, which could mean anything from he knows exactly what's going on and doesn't want to tell me to Mars is in the middle of a coup and he doesn't want to tell me. One way or the other, he's locked up tight as a rat's asshole."

"Sorry about this," Bobbie said over her shoulder.

"It's nothing she hasn't said to my face," Smith replied.

"You want me to stop the playback?" Alex asked, but Avasarala was already talking again.

"If these are more ships that got sold to whoever's chasing you, I need to know. If they're all MCRN vessels with actual Martian Navy crews, that's something very different. And since they're not answering, I'm stuck trying to peep in the windows. If you've held something back—something sensitive, something that made you uncomfortable to share with me—I absolutely understand. Your patriotism and loyalty to Mars has been a thorn in my fucking side since the day I met you, but I respect it. It speaks well of you as a soldier and as a person, and now it's time to get the fuck over it.

"Also, Nathan, if you're listening, and I assume you are, I'm the best and only friend you've got. Give her permission to share what she has, or I swear to God I'll have you turning tricks out of a prefab shed on the side of the highway. I'm trying to save humanity here. It would be just fantastic if someone would *help*."

Her voice broke on the last word, and tears appeared in her eyes. Alex felt a tightness in his chest and a sense of sorrow he'd managed to ignore until it now welled up in him. Avasarala took a deep breath, sneered, and turned her gaze back to the camera. She wiped her eyes with the back of her hand angrily. Like they'd betrayed her.

"So. No more fucking around. I love and adore you, and I can't wait for

you—all of you—to be where I can keep you safe. Be careful. And send me the fucking data. Now.”

The message ended. Bobbie let out a long, shuddering breath. Alex was pretty sure if he looked back, she’d be weeping too. Smith’s voice came from the door to the cabin.

“I’ve told her all I know about them,” Smith said. “The ships were not listed as missing. The crews aboard them all check out as Martian citizens. But so did the false escort ships. Until I have a complete audit of the military’s personnel and supply databases, I don’t know what I’m looking at.”

Alex coughed to clear his throat before he spoke. “Avasarala’s not always the most trusting person, Nate. It ain’t just you.”

“She’s thorough,” Smith said. “And she’s in a hard position. Sergeant Draper?”

There was a long silence. When Alex looked back, Bobbie’s expression was closed. Her lips pressed to a single line. “On my own initiative and without direction from Avasarala I... When I found evidence that something had gone missing, I checked to see what commanding officers were in charge of that materiel. I didn’t see any pattern in it, but someone else might. If they saw it.”

Alex closed the panel Avasarala had been in. The air seemed fragile. Smith took a short breath, made a small, noncommittal sound in the back of his throat. “Please see that I get a copy too, Sergeant Draper.”

He closed the door to the cabin behind him. Alex sat up in his couch. “You know,” he said, “you have a really weird relationship with treason. On the one hand, I think you may be the most patriotic person I’ve ever met, and on the other hand—”

“I know. It’s been confusing for me too. For a long time now.”

“Your loyalty to the corps and your loyalty to that woman ever really come to blows, it’ll be a hard day.”

“It won’t happen,” Bobbie said. “She won’t let it.”

“No?”

“She’d lose,” Bobbie said. “She hates losing.”

The message from the *Pella* came three hours later. From the first instant, it was clear that it was a press release. The answer to the questions everyone had been asking: Who did all this, and why? The man was seated at a desk, two different banners showing the split circle of the OPA on the wall behind him. His uniform was crisp and unfamiliar, his eyes soulful and gentle to the point of being nearly apologetic, his voice low and rich as a viol.

“My name,” he said, “is Marco Inaros, commander of the Free Navy. We are the legitimate military voice of the outer planets, and we are now in a position to explain both to the oppressors on Earth and Mars and also to the liberated people of the Belt the terms on which this new chapter of human liberty, dignity, and freedom are founded. We recognize the right of Earth and Mars to exist, but their sovereignty ends at their respective atmospheres. The vacuum is ours. All travel between the planets of the solar system are the right and privilege of the OPA and will be enforced by the Free Navy. All taxes and tariffs imposed by Earth and Mars are illegal, and will not be respected. Reparations for the damage done by the inner planets to the free citizens of the system will be assayed, and failure to repay them for the benefit of the full human race will be considered a criminal act.”

A throbbing had come into the man’s voice without it ever seeming to make his words affected or musical. He leaned in toward the camera, and it felt both intimate and powerful.

“With the opening of the alien gates, we are at a crossroads in human history. We have already seen how easy it would be to carry our legacies of exploitation, injustice, prejudice, and oppression to these new worlds. But there is an alternative. The Free Navy and the society and culture of the Belt are representatives of that new pathway. We will begin again and remake humanity without the corruption, greed, and hatred that the inner planets could not transcend. We will take what is ours by right, yes, but more than that, we will lead the Belt to a new, better form. A more *human* form.

“As of now, the gates to the other worlds are closed. The inner planet colony ships will be redirected to existing stations in our system, and the goods they carry contributed to building the strong outer planets that we have always deserved. We no longer recognize or accept the yoke of the inner planets anywhere in the system. The moons of Saturn and Jupiter are ours by right. Pallas Station, Ceres Station, every pocket of air in the Belt

with even one human in it, all are the natural and legal property of their inhabitants. We pledge our lives to protect those people, citizens of the greater humanity, against the historical and established crimes of economy and violence they have suffered at the gun barrels of Earth and Mars.

“I am Marco Inaros. I am commander of the Free Navy. And I call upon all free men and women of the Belt to rise up now in joy and glorious resolve. The Free Navy pledges you all the safety of our protection. This day is ours. Tomorrow is ours. The future of humanity is ours. Today, and forevermore, we are free.”

On the screen, Marco Inaros lifted his hand in the Belter idiom of greeting, militarizing the motion with his precision and focus. His face was an icon of resolve and strength and masculine beauty.

“We are your arm,” he said. “And we will strike your enemies wherever they are. We are the Free Navy. Citizens of the Belt and of the new humanity, we are yours.”

A rising chord picked up and broke into a traditional Belter protest song transformed into something martial and rousing. The new anthem of an invented nation. The image faded to a split circle and then to white. The crew of the *Razorback* were quiet.

“Well,” Bobbie said. “He’s pretty. And he’s really charismatic. But, wow, that speech.”

“It probably sounded good in his head,” Alex said. “And really, when your prelude is you kill a couple billion people, anything you say is going to sound a little megalomaniacal and creepy, right?”

Smith’s voice was calm, but the dread in it carried through. “He wasn’t talking to us.” He stood in the door to the cabin, his arms stretched to brace against the frame. His amiable smile hadn’t changed, but its meaning had. “That was meant for the Belters. And what they heard in him—what they saw in him—won’t be anything like what we did. For them, he just declared victory.”

Chapter Thirty-eight: Amos

Ash sifted down, coating everything with a few millimeters of gray. Everything stank of it. They got off the road to let relief convoys go by twice, and then once when an old electric service truck whined by, its bed filled with six or seven huddled figures. They slept when it got too dark to see, hauling the bikes into the bushes or alleys. The dead guy's emergency rations tasted like crap, but they didn't seem to be toxic.

After four days, the plants along the roadside started showing signs of dying: green leaves turning brown and curving toward the earth. The birds, on the other hand, were going crazy. They filled the air with chirps and trills and songs. It was probably sparrow for *Holy shit, what's going on, we're all gonna die*, but it sounded pretty. Amos tried to keep clear of the bigger cities, but there wasn't a lot of space left in that part of the world that wasn't paved.

Passing through Harrisonburg they were followed by a dozen dogs for about ten kilometers, the pack building up its nerve to attack. He let Peaches go ahead for that part, but it never got serious enough to make him spend bullets. When they started getting in toward Baltimore, there stopped being a way to keep clear of people.

They were still about a day from the arcology, and the smell of the world had changed to salt water and rot, when they ran into the other crew. They were moving down a commercial street, the bikes making their soft chain-hiss, and he caught sight of the others in the gloom, heading toward them. Amos slowed down, but didn't stop. Peaches matched him. From the smear of light in the east, he guessed it was about ten in the morning, but the darkness still made it hard to be sure how many of them there were. Four he could see for sure. Maybe more trailing a little way behind. Hard to say.

They were smeared with ash, the same as everything. If they had weapons, Amos didn't see them. Handguns, maybe. So he had them for range if he wanted to start shooting. They were walking, so outrunning them was also an option, if it came to that. Thing was, Peaches didn't look like anywhere near the threat she was, and pretty much everyone was going to be going off appearances. It was that kind of misunderstanding that got people killed.

The other group slowed down, but didn't stop. Wary, but not disinterested. Amos stood up on his pedals.

"Peaches? How's about you hang back a little."

"Draw down on them?"

"Nah. Let's be neighbors first."

Her bike slowed and fell behind. Ahead on the street, the others made their own calculations and came to a different conclusion. All four stepped out toward Amos together, chins raised in a diffident greeting. No trouble unless there's trouble. Amos smiled amiably, and it occurred to him this was exactly the kind of situation that had taught him how to smile like that.

"Hey," he said.

"Hey." One of the four stepped closer. He was older. He moved gracefully, center of gravity low. Maybe a veteran. Maybe just someone who'd boxed some. Amos pointed his smile at the guy, then the other three. Tension crept up the back of his neck and into his shoulders. He breathed through it, forcing himself to relax. "Coming from Baltimore?"

"Monkton," the fighter said.

"Yeah? Towers or the flats?"

The fighter's mouth twitched into a little smile. "Z tower," he said.

"Zadislav," Amos said. "Had a friend lived there once. Long time ago. How is it up there?"

"It's ten thousand people in a box with no food and not much water."

"Not so great, then."

"Power supply's all fucked up. And Baltimore's worse. No offense meant, but I'd say you're heading the wrong way." The fighter licked his lips. "Nice bikes."

"They do what we need 'em to," Amos agreed. "Only gets worse south of here. We're walking away from the strike."

"Keep going south, though, it gets warm again. That's where we're

headed. Baja complex.”

One of the others cleared her throat. “I’ve got a cousin down there.”

Amos whistled between his teeth. “That’s a hell of a walk you got there.”

“Walk there or freeze here,” the fighter said. “You and your friend there ought to come with us.”

“I appreciate the invite, but we’ve got people we’re meeting up with in Baltimore.”

“You sure about that?”

“It’s more like a working hypothesis, but it’s the plan for now.”

The fighter’s gaze flickered down to the bike again, then up to Amos’ face. The man studiously avoided looking at the rifle hanging on Amos’ back. He waited to see which way they were going. The other man nodded.

“Well, good luck to you. We’re all going to need it.”

“That’s truth,” Amos said. “Tell Baja hi for me when you get there.”

“Will.”

The fighter started off down the street, the others with him. Amos loosened the strap that held the rifle, but he didn’t draw the weapon. The four walkers moved down the ash-gray road. Peaches rode up, passing them. The last in their formation turned to watch her pass, but no one made a move.

“Everything all right?” she asked.

“Sure,” Amos said. The shadows of the other crew faded into the gloom.

“Talked them out of any unpleasant actions?”

“Me? Nope. They did most of that themselves. Best defense we’ve got right now is everyone’s in the habit of not killing each other and taking their shit. Pretty soon, people are just going to start assuming anyone they don’t know is out to slit their throats. If they’re lucky.”

She looked at him. Her face was smooth, her eyes intelligent and hard. “You don’t sound upset at the prospect.”

“I’m comfortable with it.”

With every kilometer traveled they came closer to the sea and the stink of

rot and salt grew worse. They hit the high-water mark: the place where the charge of the floodwaters had broken. The line of debris was so clear and distinct it looked deliberate. A short wall made of wreckage and mortared with mud. Once they passed it, the ash was thick with mud and the roads were covered in broken wood and construction plastic, ruined clothes and waterlogged furniture, blackened plants killed by darkness and ash and salt water. And the bodies of dead people and animals that no one was going to bother cleaning up. The bikes threw up gobbets of the muddy road and they had to push harder, bearing down with all their weight, to keep the wheels spinning.

When they were still about twenty clicks from the arcology, Amos ran into a pit filled with water and covered over with a scum of ash. It bent the bicycle's front rim. He left it where it lay, and Peaches dropped hers beside it.

He was aware of voices around him. Every step of the way, they were being watched. But between having rifles and not seeming to have anything much else, no one tried to stop them. All around, the ground floors of the buildings were gutted, walls cracked by the pitiless water, and the contents of the stores and apartments and offices puked out into the streets. Some places, the second story was just as bad; some places it was better. Above that, the city seemed almost untouched. Amos kept imagining the place like it was a healthy-looking guy with exposed bone and gangrene from the ankle down.

"Something funny?" Peaches asked.

"Nope," Amos said. "I was just thinking."

The arcology was no different. It loomed up among the ruins, towering over the debris-choked streets now the way it had over the maintained streets before. The reactor that powered the vast building seemed to still be running, because lights glowed in half of the windows. If he just put his hand over the bottom layer, Amos could almost pretend the ash was snow, and all this was nothing more than the worst Christmas in history.

They trudged into the lowest level. Icy mud stuck his pants to his skin up to the knee. Glass pipes and footprints showed where people had been but there was no one standing guard. At least no one they saw.

"What if your friend's not here?" Peaches asked as Amos poked at the elevator's call button.

“Then we think of something else.”

“Any idea what?”

“Still nope.”

He was more than half-surprised when the elevator doors opened. Flood damage could have ruined the mechanism. Of course it could also get stuck halfway up, and they could die in it. When he selected the club level, the screen clicked to life. A broad-faced woman with a scar across her upper lip sneered out at him.

“The fuck you want?”

“Amos. Friend of Erich’s.”

“We got no fucking handouts.”

“Not looking for any,” Amos said. “Want to talk about a job.”

“No jobs either.”

Amos smiled. “You new at this, Butch? I have a job. I’m here to see if Erich wants in. This is the part where you go tell him there’s some psycho in the elevator wants to talk with him, then he says who is it, and you say the guy calls himself Amos, and Erich tries not to look surprised and tells you to let me up and—”

“For fuck’s sake!” Erich’s voice was distant, but recognizable. “Let him up, or he’ll talk all day.”

Butch scowled into the screen and blinked out to the blue arcology menu system. But the car started up.

“Good news is he’s here,” Amos said.

Erich’s office looked the same as the last time Amos had been in it—the same wall screen showing the same ocean view, the rubber ball instead of a chair, the desk encrusted with decks and monitors. Even Erich didn’t look different. Maybe better dressed, even. It was the context that changed it all. The screen showed an ocean of gray and white, and Erich’s clothes looked like a costume.

Butch and the four other heavily armed thugs with professional trigger discipline who’d escorted them from the elevator walked out, closing the door behind them. Erich waited until they’d gone before he spoke, but the tiny fist of his bad arm was opening and closing the way it did when he was nervous.

“Well. Amos. You’re looking more alive than I’d expected.”

“Not looking too dead yourself.”

“As I recall the way we left it, you weren’t ever coming back to my city. Open season, I called it.”

“Wait a second,” Peaches said. “He said if you came back here, he’d kill you?”

“Nah,” Amos said. “He broadly implied that one of his employees would kill me.”

Peaches hoisted an eyebrow. “Yeah, because that’s different.”

“If this is about the old man, I haven’t checked to see if he made it or not. Deal was he kept the house, and I did that. More than that, and I’ve got other problems.”

“And I got no trouble to cause,” Amos said. “I figured things had changed enough maybe the old rules weren’t a great fit for the new situation.”

Erich walked over to the wall screen, limping. A few seagulls circled, black against the colorless sky. From the last time he’d been there, Amos knew the buildings that should have provided a foreground. Most of them were still in place close in. Out toward the shoreline, things were shorter now.

“I was right here when it happened,” Erich said. “It wasn’t a wave like a wave, you know? Like a surfer wave? It was just the whole fucking ocean humping up and crawling onto shore. There’s whole neighborhoods I used to run just aren’t there now.”

“I didn’t see anything happen,” Amos said. “The newsfeeds and the mess after were bad enough.”

“Where were you?”

“Bethlehem,” Peaches said.

Erich turned back to them. There was no anger in his face, or fear, or even wariness. That was good. “So you’re headed south, then? How bad is it up there?”

“Not that Bethlehem,” Amos said. “The one in the Carolina admin district.”

“Where the Pit is,” Peaches said, raising her hand like a kid in a classroom. Then a second later, “Was.”

Erich blinked and leaned against his desk. “Where the third strike hit?”

“Close to there, yeah,” Amos said. “Lost that tequila you gave me with the hotel, so that sucked.”

“All right. How are you still alive?”

“Practice,” Amos said cheerfully. “Here’s the thing, though. I’ve got a job. Well, Peaches has a job, and I’m in. Could use some help.”

“What kind of job?” Erich asked. A sharpness and focus came into his voice, talking business. It was like watching someone wake up. Amos turned to Peaches and waved her on. She hugged stick-thin arms around her torso.

“Do you know Lake Winnepesaukee?”

Erich frowned and nodded at the same time. “The fake lake?”

“Reconstituted, yeah,” she said. “There’s an enclave on Rattlesnake Island. The whole place is walled. Independent security force. Maybe fifty estates.”

“I’m listening,” Erich said.

“They have a private launchpad built out onto the lake. The whole point of the place is that you can drop there suborbital or down from Luna or the Lagrange stations, and be walking distance from home. Everyone there has a hangar. Probably nothing with an Epstein, but something that could get us to Luna. Going through the road, you couldn’t get past the checkpoints, but there’s a way in from the water. The boathouse locks are compromised. Put in the right code, and they pop open even if the security chip’s not in range.”

“Which you know how?” Erich said.

“I used to summer there. It’s how we got in and out when we went slumming.”

Erich looked at Peaches like he wasn’t sure how she’d gotten in the room. His laugh was short and hard, but it wasn’t a no. Amos picked up the pitch. “Idea is we get in, grab a ship, and head for Luna.”

Erich sat down on the ball, his legs wide, and rolled a few centimeters back and forth, his eyes half-closed. “So what’s the score?”

“The score?” Peaches asked.

“What are we taking? Where does the money come in?”

“There isn’t any,” Peaches said.

“Then what do I get out of it?”

“You get out of here,” Amos said. “Place was kind of a shithole before someone dropped the Atlantic on it. It’s not getting better.”

Erich’s wasted, tiny left arm squeezed tight to his body. “Let me get this

straight. You've got a score where I go seven, maybe eight hundred kilometers, sneak past some private mercenary death squad, boost a ship, and the payoff is that I get to leave everyone and everything I've got here? What's next? Russian roulette where if I win, I get to keep the bullet?" His voice was high and tight. He bit the words as he spoke them. "This is my city. This is my place. I carved my life out of the fucking skin of Baltimore, and I spent a lot doing it. A lot. Now I'm supposed to put my tail between my legs and run away because some Belter fuckwit decided to prove he's got a tiny little dick and his mama didn't hug him enough when he was a kid? Fuck that! You hear me, Timmy? *Fuck* that!"

Amos looked at his hands and tried to think what to do next. His first impulse was to laugh at Erich's maudlin bullshit, but he was pretty sure that wasn't going to be a good idea. He tried to think what Naomi would have said, but before he came up with anything good, Peaches stepped toward Erich, her arms out to him like she was going to give him a hug.

"I know," she said, her voice choked with some emotion Amos didn't place.

"You *know*? What the fuck do you *know*?"

"What it's like to lose everything. How hard it is, because you keep thinking it can't really be gone. That there's a way to get it back. Or maybe if you just act like you still have it, you won't notice it's gone."

Erich's face froze. His bad hand opened and closed so fast, it looked like he was trying to snap the tiny pink fingers. "I don't know what you're talking—"

"There was this woman I knew when I went in. She killed her children. Five of them, all dead. She knew it, but she talked about them all like they were still alive. Like when she got up tomorrow, they'd be there. I thought she was a lunatic, and I guess I let that show, because she stopped me one day at the cafeteria and said, 'I know they're dead. But I know I'm dead too. You're the only bitch here thinks she's still alive.' And as soon as she said that, I knew exactly what she meant."

To Amos' astonishment, Erich started to weep and then blubber. He fell into Peaches' open arms, wrapping his good arm around her and crying into her shoulder. She stroked his hair and murmured something to him that could have been *I know, I know*. Or maybe something else. So clearly something sweet and touching had just happened, even if he wasn't clear

what the fuck it was. Amos shifted from one foot to the other and waited. Erich's wracking sobs grew more violent and then started to calm. It must have been fifteen minutes before the man pulled himself out of Peaches' embrace, limped to his desk, and found some tissue to blow his nose.

"I grew up here," he said, his voice shaking. "Everything I've ever done—every meal I ever ate, every toilet I ever pissed in, every girl I ever rolled around with? It's all been inside the 695." For a second, it looked like he was going to cry again. "I've seen things come and go. I've seen shit times turn into normal and turn back to shit, and keep telling myself this is like that. It's just the churn. But it's not, is it?"

"No," Peaches said. "It isn't. This is something new."

Erich turned back to the screen, touching it with the fingertips of his good hand. "That's my city out there. It's a mean, shitty place, and it'll break anyone who pretends different. But... but it's gone, isn't it?"

"Probably," Peaches said. "But starting over's not always bad. Even the way I did it had some light in it. And what you've got is better than what I had."

Erich bowed his head. His sigh sounded like something bigger than him being released. Peaches took his good hand in both of hers and the two of them were silent for a long moment.

Amos cleared his throat. "So. That means you're in, right?"

Chapter Thirty-nine: Naomi

She didn't have days. Hours maybe. For all she knew, minutes. And the plan still had holes in it.

She sat in the mess, hunched over a bowl of bread pudding. People passed through from the crew quarters, some wearing Martian uniforms, some their normal clothes, a few in a new Free Navy uniform, but the other tables stayed empty apart from her and Cyn. Before she'd been almost crew. Now she was a prisoner, and as a prisoner, her schedule had changed. She'd eat when other people weren't eating; she'd exercise when other people weren't exercising; she'd sleep in the dark with her door locked from the outside.

She was grateful for it. She needed the quiet of her own mind now, and strangely, she felt comfortable there. Something had happened in the last days. She couldn't put her finger on when or how, but the dark thoughts had either vanished or else grown so vast she couldn't see their horizons. She didn't think she was crazy. She had felt her mind fishtailing out from under her one time and another in her life, and this was very different. She understood she might die, that Jim might die, that Marco might sail from success to success, that Filip might never forgive or even understand her. And she could tell that all of those facts mattered to her, and mattered deeply. But they didn't overwhelm her. Not anymore.

The umbilical linking the ships was fifty meters at full extension. Not even as wide as a soccer field. The link between the ships was between the cargo-level airlocks, where it was easier to access engineering and move supplies, which left the crew-level airlocks unused. There were EVA suits in the lockers there. With a strip of welding tape or a crowbar, she could get one in only a couple of minutes. Get into the suit, out the *Pella's* airlock,

force the airlock on the *Chetzemoka* all in the time between the drives cutting off and the *Chetzemoka* firing her maneuvering thrusters. There were no calculations for it. It would be very, very close, but she thought it was possible. And since it was possible, it was necessary.

There were problems, of course, that needed solving. For one thing she didn't have welding tape or a crowbar, and with her escorts now treating her as untrustworthy, her opportunity to steal either while running an inventory was gone. Second, once Marco saw she'd taken an EVA suit and made the jump, she had no way to keep him from firing a missile at the *Chetzemoka*. Or worse, finding some way to disable the proximity trap and come back for her. If she could get a suit on the sly, though, so that the inventory said they still had a full complement, they might think she'd killed herself. If she was dead, she posed no threat. She knew the inventory system well enough, she thought she could force an update. She knew she could, given enough time and access. But she only had hours. Maybe hours. Maybe less.

A familiar, sharp voice came from the screen where a newsfeed was still playing to the empty room. "Secretary-General Gao was more than the leader of my government. She was also a close personal friend, and I will miss her company deeply."

Avasarala's expression was careful, composed. Even through the screen and a couple hundred thousand kilometers, she radiated certainty and calm. Naomi knew it might all be an act, but if it was, it was a good act. The reporter was a young man with close-cut dark hair who leaned forward and tried to look up to the task of interviewing her. "The other casualties of the war have—"

"No," Avasarala said. "Not war. Not casualties. These aren't casualties. They're murders. This isn't a war. Marco Inaros can claim to be an admiral in command of a great navy if he wants. I can claim to be the f—Buddha. That doesn't make it true. He's a criminal with a lot of stolen ships and more innocent blood on his hands than anyone in history. He's a monstrous little boy."

Naomi took another bite of bread pudding. Whatever they used to make the raisins wasn't convincing, but it didn't taste bad. For a moment, her thoughts weren't on welding tape and inventory cheats.

"So you don't consider this an act of war?"

"War by who? War is a conflict between governments, yes? What sort of

government does he represent? When was he elected? Who appointed him? Now, after the fact, he's scrambling to say he represents Belters. So what? Any petty thug in his position would want to call it war because it makes him sound serious."

The reporter looked like he'd swallowed something sour and unexpected. "I'm sorry. Are you saying this attack isn't *serious*?"

"This attack is the greatest tragedy in human history," Avasarala said, her voice deep and throbbing. She dominated the screen. "But it was carried out by shortsighted, narcissistic criminals. They want a war? Too bad. They get an arrest, processing, and a fair trial with whatever lawyer they can afford. They want the Belt to rise up so they can hide behind the good, decent people who live there? Belters aren't thugs, and they aren't murderers. They are men and women who love their children the same as any of us. They are good and evil and wise and foolish and *human*. And this 'Free Navy' will never be able to kill enough people to make Earth forget that shared humanity. Let the Belt consult its own conscience, and you'll see compassion and decency and kindness flourish in any gravity or none. Earth has been bloodied, but we will *not* be debased. Not on my fucking watch."

The old woman sat back in her seat, her eyes fiery and defiant. The reporter glanced into the camera and then back to his notes. "The relief effort on Earth is, of course, a massive undertaking."

"It is," she said. "We have reactors in every major city on the planet running at top efficiency to provide power for—"

The screen went blank. Cyn put his hand terminal down on the table with an angry click. Naomi looked up at him from behind her hair.

"Esá bitch needs sa yutak cut," Cyn said. His face was dark with rage. "Lesson á totas like her, yeah?"

"For for?" Naomi said, shrugging. "Kill her, and another one will take her place. She's good at what she does, but even if you did slit her throat, there'd just be someone else in the same chair saying the same things."

Cyn shook his head. "Not like that."

"Close by."

"No," he said, his chin jutting a centimeter forward. "Not like that. Alles la about big social movements y ages of history y sa? Stories they make up later so it makes sense. Not like that, not real. It's people do things. Marco.

Filipito. You. Me.”

“You say so,” Naomi said.

“Esá coyo on Mars who traded us for all the ships and told us where to find supplies? He’s not ‘Martian economic despair’ o ‘rising debt ratios’ o ‘income and access inequality.’ ” With each pretentious invented term, Cyn wagged his finger like a professor lecturing a class, and it was funny enough that Naomi chuckled. He blinked at the sound, and then smiled a little shyly. “La coyo la is just some coyo. He’s a man made a deal with a man who talked up some otras, and we did things. Who people are, it matters, yeah? Can’t replace them.”

His gaze was on her now, not a professor lecturing a class, but Cyn lecturing her. She scooped the last bite of pudding into her mouth. “Get the feeling you’re saying something,” she said around it. Cyn looked down, gathered himself. She could see the effort more than she could understand it.

“Filipito, he needs you. No sabez la, but he does. You and Marco are you and Marco, but no you take the coward’s out.”

Her heart jumped a little. He thought she was in despair, that she might give in to the dark thoughts. She wondered what brought him to the conclusion, and whether it was a mistake he was making or something he could see in her that she couldn’t. She swallowed. “You telling me not to kill myself?”

“Be a bad thing to say?”

She stood up, her soiled bowl in her hand. He rose with her, following as she headed for the recycler. The weight of her body was reassuring. There was still time. They hadn’t cut the drives yet. She could still figure her way over. “What should I do, then?”

It was Cyn’s turn to shrug. “Come with. Be Free Navy. We go where they need us, do what needs doing. Help where they need help, yeah? Already eight colony ships on target.”

“Target for what?”

“Redistribué, yeah? Alles la food and supplies they got heading out for the Ring? Más a anyone ever gave the Belt. Take that, feed the Belt, build the Belt. See what es vide when we’re not scrabbling for air y ejection mass. Gardens in the vacuum. Cities make Tycho Station look some rock hopper’s head. New world without a world to it, yeah? None of this alien

bok. Blow the Ring. Burn it. Get back to people being people, yeah?”

Two women walked by, heads bent toward each other in passionate conversation. The nearer one glanced up, then away, then back. There was venom in her gaze. Hatred. The contrast was stark. On one hand, Cyn’s vision of a future where Belters were free of the economic oppression of the inner planets—of the central axioms that had formed everything in Naomi’s childhood. In her life. Civilization built by them and for them, a remaking of human life. And on the other, actual Belters actually hating her because she had dared to act against them. Because she wasn’t Belter enough. “Where does it end, Cyn? Where does it all end?”

“Doesn’t. Not if we do it right.”

There was nothing in her cabin that could help her, but since she was confined there and alone, it was where she searched. Hours. Not days.

The crash couch was bolted to the deck with thick steel and reinforced ceramic canted so that any direction the force came from was compression on one leg or another. Any individual strut might have been usable as a pry bar, but she didn’t have any way to unbolt the couch or break one free. So not that. The drawers were thinner metal, the same gauge, more or less, as the lockers. She pulled them out as far as they would open, examining the construction of the latches, the seams where the metal had been folded, searching for clues or inspiration. There was nothing.

The tiny black thumb of the decompression kit, she kept tucked at her waist, ready to go if she could just find a way. She felt the time slipping away, second by second, as she came up blank. She had to find a way. She would find a way. The *Chetzemoka* was so close to still be too far away.

If she didn’t try to go when they pulled the umbilical? If she could sneak across now and hide there until they separated... If she could get to the armory instead, and maybe find a demolition mech that could act as an environment suit... or that she could use to cut through the bulkheads fast enough that no one shot her in the back of the head...

“Think,” she said. “Don’t spin and whine. Think.”

But nothing came.

When she slept, it was for thin slips of minutes. She couldn't afford a deep sleep for fear of waking to find the *Chetzemoka* gone. And she lay on the ground with her hand clutching the base of the crash couch so that it would tug her awake if they went on the float.

What would Alex do? What would Amos do? What would Jim do? What would she do? Nothing came to her. She waited for despair, the darkness, the sense of overwhelming failure, and didn't understand why it didn't come. There was every reason to be devastated, but she wasn't. Instead there was only the certainty that if the dark thoughts did return, they would come in such strength that she wouldn't stand a chance against them. Oddly, even that was comforting.

When she knocked to go to the head, Sárta opened the door. Not that it mattered. She followed Naomi down the hall, then waited outside. The head didn't have anything of use either, but Naomi took her time in case inspiration came. The mirror was polished alloy built into the wall. No help there. If she could take apart the vacuum fans in the toilet...

She heard voices from the other side of the door. Sárta and someone else. The words were too soft to make out. She finished washing her hands, dropped the towelette in the recycler, and stepped into the corridor. Filip looked over at her. It was her son, and she hadn't recognized his voice.

"Filip," she said.

"Cyn said you wanted to talk to me," Filip said, landing the words equally as question and accusation.

"Did he now? That was kind of him."

She hesitated. Her hands itched with the need to find some way to put her hands on an EVA suit, but something in the back of her mind whispered *If they think you're alive, they'll come for you*. Anger and diffidence made the planes and angles of Filip's face. Cyn already thought she was bent on self-slaughter. It was why he'd sent Filip.

Her belly went heavy almost before she understood why. If Filip thought it too, if when she went missing, her son went to Marco and stood witness to her suicidal bent, it would be easier to believe. They might not even check to see if a suit was missing.

"Do you want to talk here in the hallway?" she said, her lips heavy, her mouth slow. "I have a little place nearby. Not spacious, but there's some privacy."

Filip nodded once, and Naomi turned down the hall, Sárta and Filip following her. She rehearsed lines in her mind. *I'm so tired that I just want it to be over* and *What I do to myself isn't your fault* and *I can't take it anymore*. There were a thousand ways to convince him that she was ready to die. But beneath those, the heaviness in her gut thickened and settled. The manipulation was cruel and it was cold. It was her own child, the child she'd lost, and she was going to use him. Lie to him so well that what he told Marco would be indistinguishable from truth. So that when she disappeared to the *Chetzemoka*, they would assume she'd killed herself, and not come after her. Not until it was too late.

She could do it. She couldn't do it. She could.

In the cabin, she sat on the couch, her legs folded up under her. He leaned against the wall, his mouth tight, his chin high. She wondered what he was thinking. What he wanted and feared and loved. She wondered if anyone had ever asked him.

I can't take it anymore, she thought. *Just say I can't take it anymore*.

"Are you all right?" she asked.

"Why wouldn't I be?"

"I don't know," she said. "I worry about you."

"Not so much you wouldn't betray me," he said, and that untied the knot. Yes, if she lied to him, it would be betraying him, and for all her failures, she'd never done that. She could. She could do it. It wasn't that she was powerless before the decision; it was that she chose not to.

"The warning I sent?"

"I have dedicated my life to the Belt, to freeing the Belters. And after we did everything we could to keep you safe, you spat in our faces. Do you love your Earther boyfriend that much more than your own kind? Is that it?"

Naomi nodded. It was like hearing all the things Marco was too polished to say out loud. There was real feeling behind them in a way she would never hear from Marco. Maybe never had. He'd soaked up all his father's lines, only where Marco's soul was safe and unreachable in its deep self-centered cyst, Filip was still raw. The pain that she had not only left him, but left him for a man from Earth lit his eyes. *Betrayal* wasn't too strong a word.

"My own kind," she said. "Let me tell you about my own kind. There

are two sides in this, but they aren't inner planets and outer ones. Belters and everyone else. It's not like that. It's the people who want more violence and the ones who want less. And no matter what other variable you sample out of, you'll find some of both.

"I was harsh to you the day the rocks dropped. But I meant everything I said. Your father and I are now and always were on different sides. We will never, ever be reconciled. But I think despite everything, you can still choose whichever side you'd like. Even now, when it seems like you've done something that can't be redeemed, you can choose what it means to you."

"This is shit," he said. "You're shit. You're an Earth-fucking whore, and always have been. You're a camp follower, looking to sleep your way into anybody's bed who seems important. Your whole life's that. You're nothing!"

She folded her hands. Everything he said was so wrong it didn't even sting. It was like he was calling her a terrier. All she could think of it was, *These are the last words you're going to say to your mother. You will regret them for the rest of your life.*

Filip turned, pulled open the door.

"You deserved better parents," she said as he slammed it behind him. She didn't know if he'd heard.

Chapter Forty: Amos

Between walking and biking, scrounging up food, and picking a route that avoided the dense populations around the Washington administrative zone, the seven-hundred-odd kilometers between Bethlehem and Baltimore had taken them almost two weeks. The four-hundred-odd clicks from the arcology to Lake Winnepesaukee took a couple hours. Erich sent out Butch—whose name was something else that Amos couldn't remember even after they told him—and two others, then sent him and Peaches to wait in another room while he had some conversations.

Twenty minutes later, Amos and Peaches and Erich and ten men and women were standing on the roof of the arcology loading into a pair of transport helicopters with the Al Abbiq Security logo on the side. Erich didn't say if they were stolen or if he'd been paying off the security force, and Amos didn't ask. Pretty much an academic issue at that point.

The landscape they passed over was bleak. The ash fall had slowed, but not stopped. The sun was a ruddy smear on the western horizon. Below them, cities bled into each other without so much as a tree or a swath of grass between them. Most of the windows were empty. The streets and highways were filled with cars, but few of them were moving. They swung out to the east as they passed by New York City. The great seawall had been shattered, and the streets flooded like canals. Several of the great towers had fallen, leaving holes in the skyline.

"Where is everyone?" Peaches shouted over the chop of the rotors.

"They're there," Erich shouted back, gesturing with his bad arm and holding on to the strap with his good. "They're all there. It's just there's not as many as there were last week. And more than there are going to be."

Over Boston, someone fired a missile toward them from the roof of a

commercial shopping district, and the copters shot it down. The sky to the east was the low bruise-dark that made Amos think of storm clouds. In the west, the sunset was the color of blood.

“We gonna have trouble with the rotors icing up?” Amos asked the pilot, but he didn’t get an answer.

They set down at an airfield a few klicks south of the lake, but Amos got a look before they landed: low hills holding the water like it was being cupped in a massive palm. There were maybe a dozen islands scattered across the lake, some as crowded with buildings as the shore, others with little tame forests if someone rich enough for the luxury lived there. The landing platform was a square of floating ceramic with red and amber lights still blinking for visual landings.

When they actually got to the water’s edge, it wasn’t as pretty. The water stank of dead fish and a coating of ash lay across the surface like someone had sifted chalk dust over the whole place. Erich’s people waded in up to their thighs and dropped three packages that unfolded into hard, black pontoon boats. By the time they started toward the enclave on Rattlesnake Island, the sky was a perfect black. No stars, no moon, no backslash of light pollution. The night was like sticking his head in a sack.

They spun to the north side of the island where a wide bridge on a coated steel pier ran out toward the launching pad. Hangars and boathouses encrusted the shore, boxes for the toys of the wealthy as big as basic housing blocks for a thousand people. The pontoon boat they were in surged forward over the chop of the water. The boathouse they chose was painted bright blue, but outside the circles of their lights, it could have been anything. It only took a minute to find the keypad on a pole that poked up from the dark water. Peaches leaned over, stretched her thin arm, and tapped out a series of numbers. For a second, it looked like it hadn’t worked, then the boathouse doors silently rose and automatic lights came on. The interior was all wood paneling, rich red cedar, and enough room for a tennis court. An angry barking came out from the darkness as they steered inside.

A wolfhound stood on the deck of a little powerboat, its paws on the rail. The pontoon boats snugged up in the space next to the powerboat. Amos hauled himself up and the wolfhound darted toward him, growling and snarling. It was a beautiful animal, genetically engineered, he figured, for the gloss of its fur and the graceful lines of its face.

“Hey there,” Amos said, squatting down to its level. “Someone didn’t bother taking you along when they left, huh? That shit’s gotta suck.”

The dog shied back, uncertain and frightened.

“How about this,” Amos said. “Don’t start anything with us, we won’t shoot you.”

“It doesn’t talk,” Erich said as the dog retreated, barking over its shoulder.

“How do you know? Assholes with this much money, maybe they put some kind of translator into its brain.”

“They can’t do that,” Erich said, then turned to Peaches. “They can’t, can they?”

“This is the Cook estate,” Peaches said. “Darwa and Khooni lived here. I used to sleep over on Wednesday nights in the summer.” She shuddered a little and Amos cocked his head. “It’s a long time since I’ve been here. It seems like it should have changed more.”

“You know how to get to their hangar?” Erich asked.

“I do.”

But when they got there, the space was empty. When they crossed the broad gravel yard to the next hangar over—the Davidovics’—it was empty too. The third one didn’t have a ship, but it did have a dozen people. They stood in the center of the space with handguns and the kind of cheap suppression sprays they sold over the counter at grocery stores. The man in front was maybe fifty with graying hair and the beginnings of a new beard.

“You, all of you, stay back!” the man yelled as Amos and Butch and three more came in through the side door. “This is private property!”

“Oh, it belongs to you?” Butch sneered. “This all your place?”

“We work for the Quartermans. We have a right to be here.” The man waggled his handgun. “You, all of you, get out!”

Amos shrugged. Another half dozen of Erich’s people had come in, most of them with assault rifles held calmly at their sides. The servants were all huddled together in the middle of the room. If they’d had any skill or practice, there would have been two or three snipers up in the rafters, ready to start picking the bad guys off while these folks kept their attention low, but Amos didn’t see anyone. “I kinda don’t think the Quartermans are coming back. We’re going to take some of their stuff. But anything we can’t use, you should feel welcome to.”

The man's face hardened, and Amos got ready for there to be a lot of dead people. But before Erich's people lifted their guns, Peaches interrupted.

"You're... you're Stokes, right?" The front man—Stokes, apparently—lowered the gun, confused as Peaches stepped forward. "It's me. Clarissa Mao."

"Miss Clarissa?" Stokes blinked. The gun wavered. He heard Butch mutter "Fucking seriously?" under her breath, but no one started firing. "Miss Clarissa! What are you doing here?"

"Trying to leave," Peaches said, with a laugh in her voice. "What are you here for?"

Stokes smiled at her, and then nervously at Amos and Erich and all the others, shining his teeth at them like the beam from a deeply insecure lighthouse. "The evacuation order came when the second rock came down. The Quartermans all left. Took the ship, and gone. They all went. The Cooks, the Falkners, old man Landborn. Everyone, they took their ships and left. Told us the security would keep us safe until relief came. But there's no relief, and the security? They're thugs. They tell us we have to pay them since the Quartermans are gone, but what do we have?"

"All the Quartermans' shit," Amos said. "Which brings me back to my first point."

"Are there any ships?" Peaches said. "We need a ship. Just to get us to Luna. That's why we came here."

"Yes. Yes, of course. The Bergavins left the *Zhang Guo*. It is in their hangar. We can take you there, Miss Clarissa, but—"

A sharp whistle came from the side door. From the street outside it. Butch met Amos' gaze. "Company," she said.

The streets on the island were wide. Roomy. Big enough to haul a ship down to the bridge. The security patrol car had the claw-and-eye logo of Pinkwater. Its headlights cut a wide cone through the darkness. Erich stood with his good hand up to shield his eyes. Two men were swaggering up toward him.

"Well now," the first man said. "What have we got here?"

Erich backed away, limping. "No trouble, sir," he said.

"How about if I determine that," the lead man said. "Get on the fucking ground." He had a cowboy hat on and his hand on the butt of his pistol.

Amos smiled. The warmth in his belly and his arms was the same kind he got when he heard a familiar song after a long time. It was just pleasant. “I said get on the ground you crippled sonofabitch! You do it now, or I’ll fuck your fucking eyeholes!”

“Peaches?” Amos called as he strode out into the light. The two security men drew their pistols and pointed them at him. “Hey, Peaches, you back there?”

“Yes?” she said. It sounded like she was in the side door. That was fine. He saw the pair of security men clock the rest of Erich’s people in the gloom. They were mostly silhouetted, but their bodies went tense. Always a bad moment, seeing you brought a knife to a gunfight.

“See, this is what I was talking about,” Amos called. “Things start falling apart, and the tribes get small. These guys, probably good upstanding folks when there’s a boss to answer to. Clients. Shareholders.” He turned to the man in the hat and grinned amiably. “Hey,” he said.

“Um. Hey,” Hat said.

Amos nodded and called back toward the hangar. “Thing is you take that away, they’re guys with guns. They *act* like guys with guns. Do guys-with-guns stuff. Right?”

“I follow you,” Peaches said.

“You should put your guns down,” Amos said to Hat. “We’ve got just a shitload more of them than you do. So really.”

“You heard the man,” Butch said. “Guns on the ground, please.”

The security men glanced at each other.

“We could have just shot you,” Amos said. As Hat and his partner slowly lowered their guns to the pavement, Amos raised his voice again. “So Peaches, these guys? They go from being protectors of this big tribe with what’s-his-name and them inside the tribe to being protectors of their own little tribe, and those folks on the outside of it. It’s all about who’s in and who’s out.”

Hat lifted his hands, palms out, about shoulder high. Amos hit him in the jaw. It was a solid punch, and his knuckles ached from it. Hat staggered back, and Amos stepped forward twisting his body into the kick. It landed on Hat’s left kneecap and the man screamed.

“Thing is,” Amos called, “most of us don’t got room in our lives for more than six”—he straight-kicked Hat in the middle of the back as he tried

to stand up—“maybe seven people. You get bigger than that, you got to start telling stories about it.”

Hat was crawling back toward the car. Amos put his knee on the man's back, leaned down, and started emptying Hat's pockets and belt. Chemical mace. A Taser. A wallet with ID cards. A two-way radio. He found the unregistered drop gun strapped to the guy's ankle. Each thing he took, he threw out to the edge of the water, listening for the splash. Hat was weeping, and Amos' weight made it hard for him to breathe. The other one was standing perfectly still, like if he didn't move Amos wouldn't notice him. Wasn't like he had a better strategy at this point.

Amos grinned at him. “Hey.”

The guy didn't say anything.

“It's okay,” Amos said. “You didn't say you were gonna skullfuck my friends, right?”

“Right,” the other one said.

“Okay, then.” Amos stood up. “You should probably get him to a doctor. And then whoever else you've got on this shithole of an island, tell them what I did, and how I didn't fuck you up because you hadn't fucked with me. Okay?”

“All right.”

“Great. And then don't come back around here.”

“I won't.”

“We won't,” Amos said. “You mean we won't. Not you and not your tribe.”

“We won't.”

“Perfect. No problems, then. And give Butch your stuff, all right? Drop gun too.”

“Yes, sir.”

Amos walked back toward the hangar. Sure enough, Peaches was standing in the doorway, her arms crossed. He wiped his hand. His knuckles were bleeding.

“See, that's what civilization is,” he said. “Bunch of stories. That's all.”

“So what if it is?” Peaches said. “We're really good at telling stories. Everything just turned to shit, and we're already finding ways to put it back together. Stokes and the other servants were ready to fight us or get killed, but then I knew his name and he remembered me, and now there's a story

where he wants to help us. You go out there and you send a message about how those guys should leave us alone. All of us. More than just six or seven. And, side note here, you know the Pinkwater guys are going to come back and try to kill you for that, right?”

“Just need ’em to take a long time gearing up,” Amos said. “Figure we’ll be off the ground by then.”

Stokes leaned in from behind Peaches, his expression apologetic. “About that? There is a small problem.”

The hangar was as tall as a cathedral, and the *Zhang Guo* stood in the middle of it like a piece of gargantuan art. The surface of the ship was worked to look like gold-and-silver filigree over a body of lapis. The drive cones had golden ideograms written on them in something that looked like gold but apparently didn’t melt at high temperature. He could tell from looking it didn’t have an Epstein drive. Twice as big as the *Rocinante* and maybe—*maybe*—a quarter as functional, it was as much an orbital shuttle as it was a confession of decadence.

And, more to the point, it didn’t run.

“The house power supplies are exhausted,” Stokes explained. “Without power, there’s no water recyclers. No heat. No network connections.”

“So,” Amos said. “You figured the smart move was to get a bunch of people who’ve never seen a working fusion drive to just fire one up so you could top off the batteries? That’s the kind of suicidal optimism you just don’t see every day.”

Stokes shrugged. “The ship was here only because it needed repair. We were never able to make it run.”

Amos clapped the man on the shoulder. “You just go get me all the tools you were using. This is something I know how to do.”

Stokes trotted away, shouting to the others from his group. Erich’s people seemed to be equally divided between setting up a defensive perimeter and looking for the most expensive things that would fit in their pockets. Erich and Peaches came to stand beside him.

“How fucked are we?” Erich said.

“Don’t know,” Amos said. “First guess, there’s something hinky with the power supply. Too much noise. A bad coupler. Something that’s triggering the safety shutdown. But I’ve got to get between her hulls and take a peek.”

“I’ll help you ring the circuits,” Peaches said. Erich looked over at her, confused. “I spent a few months as an electrochemical technician,” she said.

“Well of fucking course you did,” Erich said.

“You bring a deck?” Amos asked.

“Sure,” Erich said. “Why?”

Amos pointed at the drive cone with his chin. “You can get the diagnostics running, and I can tell you what the output means.”

Erich frowned and scratched his neck thoughtfully with his tiny arm. “Sure. Figure I can do that.”

Peaches coughed once, then chuckled. “Erich? Did you ever, you know, *kill* anyone?”

“I run a drug empire in Baltimore,” Erich said. “Of course I’ve killed someone. Why?”

“Nothing,” she said. “It’s just here we are, three murderers, and what’s going to save our asses if anything does is that we happen to have the skill set to repair a fusion drive.”

Erich smiled. “We are kind of well suited to this, aren’t we?”

“Well, we’d better set up some lookouts while we do it, though,” Amos said. “My plan to get out of here before trouble comes back may not work out.”

“I can have Stokes help with that too,” Peaches said. “They can’t fight, but they can watch. And I can get a few of the savvy ones to help us put the ship together if you want.”

“More the merrier,” Amos said. “Long as they don’t touch anything unless we tell them.”

“When we go, are we taking them with us?” Peaches asked.

“Yup,” Amos said.

She smirked. “Because they’re tribe?”

“Shit no. My tribe is the crew on the *Roci*, maybe you two, and a dead woman. I don’t actually give a shit if every damned one of ’em dies.”

“So why take them?”

One of Erich’s people called out. Another one laughed, and one of the

servants tentatively joined in. Amos rubbed the raw spots on his knuckles and shrugged. “Seems like the sort of thing Holden’d do.”

Chapter Forty-one: Naomi

Naomi lifted the handles of the resistance machine over her head then let them slowly down. Sárta sat on the box of resistance gel and watched her like someone a little bit bored at a zoo. Naomi didn't care. They didn't talk. For every purpose but the ones that mattered most, Naomi was alone.

The trick, she'd decided, was not to remove just one EVA suit, but all of them. Corrupt the data, and no one would know whether she'd taken something or not. But if she only broke the inventory for the suits, that would be telling too. She lifted the handles. The muscles in her arms and shoulders ached. She let the handles down, savoring the pain. If she could get one of the scanners she'd used before, she might be able to feed false data into the system. Fill it with a few thousand phantoms. A million EVA suits filling every square centimeter of the ship. Then even if she couldn't erase the data, she could render it useless. The problem was—

The warning Klaxon sounded. Naomi's heart sank into her belly. They were preparing to go to free fall. She was out of time. She wasn't ready. Outside the ship right now, the umbilical was still in place. As soon as it was hauled in, the *Pella* and the *Chetzemoka* would peel apart, and all her fragile hopes would die. She let the handles drop. The cable pulled them back into place, ready for the next person.

She wasn't ready. She wasn't going to *be* ready. It didn't mean she wouldn't try.

She walked the few steps to the resistance gel and nodded at the guard. "Going to the head."

"Just been, you."

"Going again," she said, turning away.

"Hell you are. Hey!" Naomi pretended to ignore the woman, listening as

she scrambled down to come after her. She'd been a model prisoner up to now, and the defiance took Sárta by surprise. Well, it was meant to. The warning sounded again, and the count. Zero g in three. Two. Naomi put both hands on the doorframe. One. Up and down vanished, and she pulled her body into a tight curl and exploded out toward Sárta. Both her feet hit the guard in the belly, sending her back through the wide empty air of the room. She grabbed Naomi's left shoe, prying it off as she spun away. It would take her seconds to reach the other side of the room and something to push against. That was her head start. Sárta was already shouting.

Naomi flipped herself through the hatch, then down the hall, too fast for safety. She had minutes. She had less than minutes. Had she really thought she could pry open a locker, pull on a suit, and cycle the airlock? The math had worked at the time. She couldn't imagine it now.

Sárta was somewhere behind her, shouting. Raising the alarm. But Naomi was already around the corner. With sight lines broken, Sárta would have to guess where she'd gone. With luck, it would buy her a few more seconds. She only needed seconds. She only had them. The crew airlock was closed. She cycled the inner door open, then started pulling at lockers. If someone—anyone—had slipped up. Left one unlocked. The metal clanked and rattled under her fingertips as she tugged and tugged and tugged. Was the umbilical unhooked yet? Were they pulling it in? It seemed like they must be.

There were voices raised from down the hallway. Men and women shouting. One of them was Sárta. Another one was Cyn. She felt herself sobbing and ignored it. She couldn't fail. She couldn't. Not this time. Not now.

For a sickening second, she didn't feel the decompression kit at her waist. She slapped the place where it had been pressed against her skin, and it was there. If she could just get a *suit*. She tried another locker. Her heart skipped as it opened. A simple EVA suit hung there, suspended in the null g by thin bands of elastic. She reached for it.

She stopped.

They'll know the suit is missing, a small voice said in the back of her mind. *They'll know where you've gone. They'll come after you.*

Her breath was heavy and fast, her heart racing. The thing she'd been trying not to think for the last hours came to the front of her mind like an

old friend. *Fewer than fifty meters. It isn't far. You can make it.*

She closed the locker. The inner door of the airlock was open now. She launched herself toward it, forcing herself to pant. To hyperoxygenate. She couldn't tell if the dizziness she felt was from too much oxygen or a kind of existential vertigo. She was really going to do this. Naked in the void. She braced her palms against the outer door of the lock. She expected it to be cold. That it was the same temperature as any decking seemed wrong.

Fifty meters in hard vacuum. Maybe less. Maybe it was possible. She couldn't depressurize first. The long seconds matching the airlock to the outer nothingness would take more time than she had. She'd have to blow it out. Full pressure to nothing in a fraction of a second. If she held her breath, it would pop her lungs. She would have to blow herself empty first, let the void into her. All around her heart. Even if it worked, it would do her damage.

She could handle that.

The voices were loud and getting louder. Someone shouted, "Find the fucking bitch!" Cyn sloped in past the lockers. His eyes widened. Sárta was behind him. *Good, she thought. Perfect. Let them see.* The indicator went from green to red under her thumb. Cyn launched across the room with a wordless cry as the inner door started to close. For a moment, she thought he wouldn't make it, but his hands caught the edge of the door and hauled himself through. She tried to push him back, but he forced his way in.

The airlock door closed behind him, the magnetic seals clacking. Naomi held the handhold by the control panel, waiting for him to hit her. To kick. To put her in a chokehold. The lock was small enough he could put flat palms on both doors. She couldn't get away from him if he attacked, but he didn't. On the other side of the door, Sárta was shouting. Naomi thumbed the emergency override. Three options appeared: OPEN SHIP DOOR, OPEN OUTER DOOR, RETURN TO CYCLE.

"Knuckles, no you hagas eso." His hands were spread before him, wide and empty. "Bist bien. Bist bien alles."

"What are you doing?" Naomi said, surprised to hear the pain in her voice. "Why did you do that?"

"Because you my people, yeah? We're Belt. Born on the float. You, me. Alles la." Tears were welling up in his eyes, waves sheeting over pupil and

iris with no gravity to fight the surface tension. “We travel so far, vide—uns the promised land. And we go all of us together. Tu y mé y alles.”

“You aren’t saving me,” she said.

The big man crossed his arms. “Then I’m die trying. You’re my people. We look out for each other. Take care. Not going to stand by while you die. Won’t.”

She should have been panting, forcing oxygen into her blood. She should have been flying across the emptiness. Cyn floated, turning slowly clockwise a degree at a time, his lips pressed tight, daring her to deny him. Daring her not to see that she was loved here, that she had family here, that she belonged.

Someone hit the inner door of the lock. The voices were louder. More numerous. Naomi knew she could open the door, but if she did, Cyn wouldn’t be the only one going out it. If he’d wanted to, he could have beaten her down by now. That he hadn’t meant he’d chosen not to. Naomi’s heart felt trapped between stones. She couldn’t blow the door. She had to. She couldn’t kill Cyn. She couldn’t save him. *Whatever you do now*, she thought, *you will regret it forever*. Seconds passed.

Another voice. Filip on the other side of the airlock door. She could hear him shouting, telling her to open the door. He sounded frantic.

How the hell did she keep getting into these situations?

“Be strong,” Cyn said. “For Filipito, be *strong*.”

“Okay,” she said. She pushed her jaw forward in a yawn, opening her throat and her Eustachian tubes. Cyn yelped as she hit OPEN OUTER DOOR. Air tugged at her once, hard, as it evacuated. Adrenaline flooded her blood as she was assaulted invisibly on every square centimeter of flesh. The breath in her lungs rushed out of her, trying to pull her lungs along with it. Cyn grabbed at the airlock frame to keep himself inside, spun, screaming, was gone.

With her lungs empty, there was no reserve. She wasn’t holding her breath, surviving off the gas held inside her. Someone could hold their breath for a couple minutes. In the vacuum, she could make it maybe fifteen seconds unaided.

One thousand one. Naomi shifted, hand over hand, to brace against the inner door and look out. The void was there, the great dome of stars. The

Chetzemoka glowed in sunlight brighter than the Earth had ever seen. The umbilical hung to her left, too bright to look at directly and more than halfway retracted. Her ribs ached; her eyes ached. Her diaphragm tugged at her gut, trying to inflate lungs squeezed to knots. If she'd had an EVA suit, it would have had attitude thrusters. Without them, she had one chance and no time to think about it. *One thousand two.* She launched.

For a moment, she saw Cyn in the corner of her eye, a flicker of pale movement. The sun was below her, vast and bright. Radiant heat pressed against her throat and face. The Milky Way spread out, arching across the endless sky. Carbon dioxide built up in her blood; she could feel it in the burning drive to breathe. The *Chetzemoka* grew slowly larger. *One thousand five.* Shadows streaked its side, every protrusion and rivet cutting the sunlight into strips of darkness. Everything fell slightly out of focus as her eyes deformed. The stars shifted from diamond points of light to halos to clouds, like the whole universe dissolving. She'd thought it would be silent, but she heard her heartbeat like someone hammering in the next deck.

If I die here, she thought, at least it's beautiful. This would be a lovely way to die. One thousand eight.

The lines of the *Chetzemoka's* airlock became clear enough to make out. Without magnetic boots, she'd have to reach it with bare handholds, but she was close. She was almost there. The world began to narrow, lights going out in her peripheral vision even as the bright ship grew larger. Passing out. She was passing out. She plucked the black thumb out of her belt, twisted it to expose the needle, and slammed it into her leg. *One thousand ten.*

A coldness spread through her, but the colors came back as the sip of hyperoxygenated blood poured through her. An extra bit of breath without having the luxury of breathing out first. The airlock indicator on the *Chetzemoka's* skin blinked, the emergency response received, the cycle starting. The ship loomed up. She was going to hit, and she couldn't afford to bounce. She put her hands out fingers first, and prepared to crumple as she struck. There were handholds on the surface—some were designed, but others were the protrusions of antennae and cameras. She hit with all the same energy she'd kicked off with, the ship slamming into her. She'd known to expect that. She was ready. Her fingers closed on a handhold. The force of the body wrenched her shoulder and elbow, but she didn't lose her

grip. *One thousand thirteen.*

Across the gap, the umbilical was in the *Pella*. Maneuvering thrusters lit along the warship's side, an ejection mass of superheated water glowing as it jetted out. Cyn's body—he would have lost consciousness by now—was out there somewhere, but she couldn't see it. He was already lost, and at least Sárta and Filip and maybe others had seen them both. Cyn and Naomi in the airlock without suits, and then gone. Spaced. Dead.

Not dead yet. She had to get moving. Her mind had skipped a fraction of a second. She couldn't do that. Naomi pulled herself carefully, skimming along centimeters from the skin of the ship. Too fast, and she wouldn't be able to stop. Too slow and she'd pass out before she reached safety. All she could do was hope there was a golden middle ground. *One thousand...* She didn't know anymore. Fifteen? Her whole body was a confusion of pain and animal panic. She couldn't make out the stars at all anymore. The *Pella* was a blur. The saliva in her mouth bubbled. Boiled. A high, thin whine filled her ears, an illusion of sound where no sound was.

A lot of things happen, she thought, vaguely aware she'd said it to someone else, not long ago. *Even this*. She felt a wave of peace wash over her. Euphoria. It was a bad sign.

The airlock was there, five meters away. Then four. Her mind skipped, and it was flashing past her. She shot out her arm, grabbing for it, and the frame hit her wrist. She clutched for it, snatching the way Cyn had. She was spinning, the impact turning all her forward momentum angular. But she was over the airlock. Its pale mouth rose up from under her feet and vanished overhead, and back again, and back again. When she reached out, her hand was actually inside the ship, but she couldn't touch the frame. Couldn't pull herself in. The *Pella* was drifting away, losing its color as her consciousness began to fade. So close. She'd come so very close. Centimeters more, and she might have lived. But space was unforgiving. People died there all the time. The *Pella* loosed another plume from its maneuvering thrusters, as if in solemn agreement.

Without thinking, she drew up her leg, the spin increasing as she bent tight. She pulled off the shoe that Sárta hadn't gotten. Her hands felt weird. Clumsy, awkward, more than half numbed. When she stretched back out, the spin slowed to what it had been. She tried to judge the timing, but too little of her mind was left. In the end, she saw the *Pella* at the end of a

distant and darkening hall and threw the shoe at it as hard as her failing strength allowed.

Ejection mass. The spin slowed. Her hands reached farther into the airlock. She was drifting in. Her heel hit the steel frame and the pain was excruciating and very far away. Her mind blinked. She had an impression of the airlock control panel, the lights trying to impart some critical information. She couldn't see the colors or the symbols on the pad. Her consciousness faded and was gone.

Naomi woke herself up coughing. The deck was pressing against her face. She couldn't tell if she was desperately weak or under high burn. The edges of the airlock around her were fuzzy. She coughed again, a deep wet sound. Images of hemorrhaging lungs filled her mind, but the fluid she brought up was clear. Her hands were almost unrecognizable as hands. Her fingers were thick as sausages, filled with plasma and fluid. Her skin was too hurt to touch, like a bad sunburn. Her joints ached from her toes to the vertebrae in her neck. Her belly felt like someone had kicked her in the gut a couple dozen times.

She forced a breath. She could do that. Inhale, exhale. Something gurgled in her lungs. Not blood, though. She told herself it wasn't blood. She rolled onto her side, tucked her legs up, rose to sitting, and then lay back down again as the world swam. That was more than a g. That had to be more than a g. She couldn't be that weak, could she?

The *Chetzemoka* hummed under her. She realized vaguely that she was hearing words. Voices. A voice. She knew that didn't make sense, but she didn't know why. She pressed her hands to her face. A storm of emotions ran through her—elation, grief, triumph, rage. Her brain wasn't working well enough yet to associate them with anything. They just happened, and she watched and waited and gathered her scattered self together. Her hands and feet started hurting, tortured nerve endings screaming at her. She ignored them. Pain was only pain, after all. She'd lived through worse.

Next time, she made it to her feet. The little black thumb of the decompression kit was still lodged in her leg. She pulled it out, lifted it to

shoulder high, and dropped it. It felt like maybe one and a half, two gs. That was nice. If she'd felt this bad at just one g, she'd have been worried. She should probably have been worried anyway.

She cycled the inner door open and stumbled out to the cheap locker room. The lockers hung open, EVA suits hanging in them or scattered on the floor. The air bottles were all gone. The voice—it was just one voice, but her ears seemed to have lost all their treble and left only an incomprehensible soup of bass tones—was familiar. She thought she should know it. She moved through the abandoned ship. She wondered how long she'd been unconscious, and if there was any way to know where she was, what heading she was on, and how fast she was already traveling.

She reached a control panel and tried to access the navigation system, but it was locked down. As was the comm, the system status, the repair and diagnostics. She laid her forehead against the panel more from exhaustion than despair. The direct contact of bone on ceramic changed the voice, sound conduction through contact, like pressing helmets together and shouting. She knew the voice. She knew the words. "This is Naomi Nagata of the *Rocinante*. If you get this message, please retransmit. Tell James Holden I am in distress. Comm is not responding. I have no nav control. Please retransmit." She chuckled, coughed up the clear fluid, spat it on the deck, and laughed again. The message was a lie built by Marco to lure Jim to his death.

Every bit of it was true.

Chapter Forty-two: Holden

Arnold Mfume, who wasn't Alex, came out of the crew quarters still drying his hair. When he saw Holden and Foster—the two captains—by the coffee machine, he grimaced.

“Running a little late there, Mister Mfume,” Foster Sales said.

“Yes, sir. Chava just pointed that out to me. I'm on my way.”

“Coffee?” Holden said, holding out a freshly brewed bulb. “Little milk, no sugar. Might not be how you take it, but it's ready now.”

“I won't say no,” Mfume said with a fast, nervous smile. Holden couldn't place his accent. Flat vowel sounds and swallowed consonants. Wherever it came from, it sounded good on him.

As Holden handed over the bulb, Foster cleared his throat. “You know it's a bad habit to be late for your shift.”

“I know, sir. I'm sorry, sir. It won't happen again.”

And then, Mfume was gone, bolting up the ladder toward the cockpit faster than the lift would have taken him. Foster sighed and shook his head. “It's good being young,” he said, “but some people wear it better than others.”

Holden tapped in an order for another coffee. “I wouldn't want people to judge me by what I did in my twenties. What about you? Can I get you one?”

“More of a tea man, myself,” the other captain said. “If that's an option.”

“Don't know that I've ever tried.”

“No?”

“There was always coffee.”

The morning meeting had started off as just part of the shakedown. Between the new crew and the uncertainty surrounding the ship, it had

seemed like a good idea for Holden and Foster Sales to touch base with each other, compare notes, make sure that everything was the way it was supposed to be. The care Foster took to treat the *Roci* with respect had helped Holden. The new crew wasn't his, and he didn't feel comfortable with them, but they weren't going through the real crew's lockers while no one was looking. And day by day, their presence was growing more familiar. Less strange.

When he called down to engineering and Kazantzakis or Ip replied, it didn't seem as wrong anymore. Finding Sun-yi and Gor wired into gaming goggles shooting the crap out of each other in simulated battles—because as weapons techs with no one to shoot at they were getting antsy—stopped being weird and edged into sort of endearing. Maura Patel was spending her insomniac, sleepless shifts upgrading the tightbeam system. Holden knew it was something Naomi had on her list of projects, but he let Maura do it anyway. And after the long, quiet days in the dock, sleeping in his couch and waking to an empty ship, part of him even appreciated the company. They might be the wrong people, but they were people. Having guests in his house kept him from descending into his fear and anxiety. He was only putting on a brave face, but it actually made him feel a little braver.

“Anything else I should be aware of?” Foster asked.

“Just I want to know if anything happens with the *Razorback* or the *Pella*,” Holden said. “Or if we get a message from Earth. Amos Burton or my family, either one.” As if they were different.

“I think you’ve made that clear to the crew,” Foster said solemnly, but with a glimmer of amusement in his eye. Probably Holden had made the point a few times. To everyone. The coffee machine chimed and gave Holden a fresh bulb. Foster made his way to the ladder, and then down toward the torpedo bays where Kazantzakis was cleaning things that were already clean. Holden waited a few seconds and then headed up to the ops deck. Chava, coming down, met him, and they did a little awkward no-you-first dance before they got past each other.

Fred was in the crash couch that he'd appropriated as his office. The hatch to the cockpit was closed, but Holden could still hear the wailing of the raï that Mfume liked to listen to during his shift in the pilot's seat. Between that and the coffee, he wouldn't be sleeping, but Fred had put headphones on and so didn't hear Holden coming. The image on his screen

was familiar. Marco Inaros, the self-styled head of the Free Navy and public face of the devastation of Earth. And—Holden tried the thought carefully in case it hurt too much to think it—if Naomi was dead, the man who'd probably killed her. His chest contracted painfully and he pushed the idea away. Thinking about Amos and Naomi was too dangerous.

Fred turned sharply, noticing him, and pulled off the headphones. "Holden. How long have you been there?"

"Just came up."

"Good. Hate to think I'm getting too feeble to know when there's someone in the room. Everything all right?"

"Apart from being in the middle of a system-wide coup with half of my crew missing? Peachy. I mean, I'm not sleeping, and when I do it's nightmares from start to finish, but peachy."

"Well, it was kind of a stupid question. Sorry about that."

Holden sat on the couch beside Fred's and leaned in.

"What do we know about this guy?"

"Inaros?" Fred said. "He was on my short list of possibilities when the rocks dropped. Not the head of it, but in the top five. He leads a splinter group of high-poverty Belters. The kind of people who live in leaky ships and post screeds about taxation being theft. I've spoken to him a time or two, usually to deescalate a situation he wanted to set on fire."

"You think he's the one behind it all?"

Fred sat back, his couch gimbals hissing as they shifted. From the headphones, Holden could hear the man's voice even over the murmurs of rai—"We will begin again and remake humanity without the corruption, greed, and hatred that the inner planets could not transcend..."

Fred grunted and shook his head. "I don't see it. Inaros is charismatic. And he's smart. Watching his press release, he certainly thinks he's in charge, but he'd have to. The man's a first-rate narcissist and a sadist besides. He'd never knowingly share power with anyone if he could help it. This level of organization? Of coordination? It seems beyond his reach."

"How so?"

Fred gestured toward the screen. The light from it glowed in his eyes; tiny images of Inaros giving his salute. "It doesn't feel right. He's the kind of man who carries a lot of weight in a small circle. Playing at this scale isn't what he does best. He isn't a bad tactician, and the timing of the

attacks was showy in a way that seems like he was likely behind them. And he's charming at the negotiating table. But..."

"But?"

"But he's not a first-class mind, and this is a first-class operation. I don't know how to put it better than that. My gut says that even if he's taking credit for it, he has a handler."

"What would your gut have said before the rocks dropped?"

Fred coughed out a laugh. "That he was an annoyance and a small-time player. So yes, it may just be sour grapes on my part. I'd rather think I was outplayed by someone who's a genius at something grander than self-mythologizing."

"Do you have any idea why Naomi would be on his ship?"

Fred's gaze shifted from the hazy middle distance of thought to directly on Holden. "Is that someplace we want to go right now?"

"Do you?"

"I don't. But I can speculate. Naomi is a Belter, and what I know of her says she grew up in the same circles as Inaros and his crew. I have to assume they crossed paths before and had some unfinished business. Maybe they were on the same side, maybe they were enemies, maybe both. But not neither."

Holden leaned forward, elbows on his knees. As general as they were, as gently as he'd said them, the words were like little hammer blows. He swallowed.

"Holden. Everyone has a past. Naomi was a grown woman when you met her. You didn't think she'd popped out of the packaging right when you set eyes on her, did you?"

"No, of course not. Everyone on the *Canterbury* was there because they had a reason. Including me. It's just if there was something big, like 'part of a cabal that went on to destroy Earth' big, I don't know why she wouldn't have told me."

"Did you ask?"

"No. I mean, she knew that I was interested. That she could tell me whatever she wanted to tell me. I figured if she didn't want to, that was up to her."

"And now you're upset that she didn't. So what changed? Why are you entitled to know things now that you weren't entitled to know before?"

The raï from the cockpit paused, silence filling the ops deck. On Fred's screen, the playback had reached the split circle as it faded to white. "I may," Holden said, "be a small, petty person. But if I'm going to lose her, I at least need to know why."

"We'll see if we can't put you in a position to ask her yourself," Fred said. The music from the cockpit kicked in again, and Fred scowled up at the hatch. "If it's any comfort, I think we have a chance. I don't think it'll be long before he's ready to open negotiations."

"No?" Holden said. It was such a thin sliver of hope, but he felt himself jumping to it all the same.

"No. He got the jump on us tactically. I will absolutely give him that. But the next part is where he has to actually consolidate and hold power. That's not tactics. That's strategy, and I don't see anything in him that leads me to think he has a handle on that."

"I do."

Fred waved a hand like Holden's words had been smoke and he was clearing the air. "He's playing a short-run game. Yes, his stock's high right now, and probably will be for a little while. But he's standing in the way of the gates. All of this is to stop people from going out and setting up colonies. But the hunger is already out there. Smith couldn't stop Mars from depopulating itself. Avasarala couldn't put the brakes on the process, and God knows she tried. Marco Inaros thinks he can do it at the end of a gun, but I don't see it working. Not for long. And he doesn't understand fragility."

"You mean Earth?"

"Yes," Fred said. "It's the blind spot of being a Belter. I've seen it over and over in the past few decades. There's a faith in the technology. In the idea of maintaining an artificial ecosystem. We're able to grow food on Ganymede, so they think humanity's freed from the bonds of Earth. They don't think about how much work we had to do for those crops to grow. The mirrors to concentrate the sun, the genetic modifications to the plants. The process of learning to build rich soil out of substrate and fungus and full-spectrum lights. And backstopping all of that, the complexity of life on Earth. And now these new worlds... well I don't have to tell you how much less hospitable they are than it says on the box. Once it becomes clear that he's got it wrong—"

“He doesn’t, though,” Holden said. “Yeah, okay, the ecological part maybe he hasn’t thought all the way through, but when it comes to the Belt, he *isn’t* wrong. Look at all the people who just pulled up stakes and headed out for the rings. Ilus or New Terra or whatever the hell you want to call it? It’s a terrible, terrible planet, and there are people living on it. All those colony ships that left Mars to go try terraforming a place that’s already got air and a magnetosphere? A lot of those people are really, really smart. Even now, just now, you said how the pressure to get out to the new systems is more than this guy expects or is prepared for. That means he’s doomed, maybe. But that doesn’t make him wrong. We have to make him be wrong.”

“You think I don’t know that?” Fred said. “What I was doing with Medina Station would have—”

“Would have made a place for all the people living on Medina Station. But asteroid prospectors? Water haulers? The crews that are barely eking by? Those are who Marco’s talking to, and he’s right because no one else is taking them into account. Not even you. They’re looking at the future, and they’re seeing that no one needs them anymore. Everything they do will be easier in a gravity well, and they can’t go there. We have to make some kind of future that has a place for them in it. Because unless we do, they have literally nothing to lose. It’s all already gone.”

The system chimed and Maura’s voice came over the speakers. “Captain Holden, sir?”

“I’m here,” Holden said, still looking at Fred’s angry scowl. “And aren’t you supposed to be off shift, Mister Patel?”

“I am off shift, sir. But I couldn’t sleep, so I was running some diagnostics. But Captain Sales said you wanted an alert if the situation changed with the *Razorback* and its pursuers?”

Holden’s mouth flooded with the metallic taste of fear. “What’s going on?”

“We’re getting reports that the Free Navy ships have broken off, sir. The UN forces are still half a day out, but the thought is the Free Navy vessels are trying to steer well clear of any large-scale confrontation.”

“The *Pella*?” Holden said.

“With the Free Navy fleet, sir, but when they made the course change, a civilian ship broke off from the grouping, turning the other way. It’s got a

lot of inertia to overcome, but unless it changes its acceleration profile, it looks to be on a course that will bring it within a million clicks of us.”

“That’s not accidental,” Fred said.

“It isn’t, sir,” Maura said. “The vessel’s registered at the *Chetzemoka*, and it’s broadcasting a message on loop. Message follows.”

Holden’s knuckles hurt and he forced himself to relax his fists. Naomi’s voice filled the ops deck, and it was like being on the verge of passing out from dehydration and being handed a glass of water. As dire as the message was, Holden still felt every syllable untying his knots. When Naomi’s message was done, he fell back in his couch, limp as a rag. She was in trouble, but it was trouble they could fix. She was on her way back toward him.

“Thank you, Mister Patel,” Holden said. “In thanks, you may now have all my stuff. I don’t care about any of it anymore.”

“Including the coffee maker, sir?”

“Almost all my stuff.”

When Fred spoke, his voice was hard. Sharp. Unrelieved. “Mister Patel, what relief ships are in the vicinity?”

“Transponder data shows nothing, sir. The inner system’s been pretty much shut down. UN order.”

Holden rolled to his side and called up a connection to Mfume. Music blared out of the console. Mixed with the sounds filtering through the deck, it made the ops deck seem larger than it was. “Mfume!” Holden shouted, and then a few seconds later, “Mister Mfume!”

The music turned down, but not off. “Sir?”

“I need you to take a look at the flight path for the *Chetzemoka*. See what it’s going to take to match orbits with her.”

“What ship?” Mfume said.

“The *Chetzemoka*,” Holden said. “Just check the newsfeeds. It’ll be there. Let me know what you figure out as quickly as you possibly can. Like now would be good.”

“I’m on it,” Mfume said, and the music turned off both on the console and from the hatch. Holden took a deep breath, then another, then laughed. The relief wasn’t an emotion. It was too physical and profound for that. It was a state of being. It was a drug that poured invisibly through his veins. He started laughing and it turned into a moan that sounded like pain, or else

pain's aftermath.

Fred clicked his tongue against his teeth. "So. If I were to suggest that we not rendezvous with that ship?"

"I would be happy to let you and your friends off anywhere between here and there," Holden said. "Because unless you've decided to turn to piracy and throw me out the airlock, that ship is where we're going."

"I thought as much," Fred said. "Can we at least agree to be careful approaching it?"

Holden felt a little bubble of rage rise up in him. He wanted to shout at Fred, to punish him for taking this moment and soiling it with doubt. With the possibility that it was a trap and not Naomi coming home at last. Holden took the great glowing sense of release and tried to put it aside and his anger with it.

"Yes," he said. "You're right. It could be a trap."

"It may not be," Fred said. "I hope it isn't. But..."

"But we're living in interesting times," Holden said. "It's okay. I get it. I'll be careful. *We'll* be careful. But if it is her, and she really is in trouble, she's my first priority. That's just the way it is."

"I know," Fred said, and the way he said it meant *I know, and everyone who knows anything about you does too. Which is why you should be careful.*

Holden turned to the monitor and pulled up the nav data. As he watched, Mfume laid in the course that would get him to Naomi. Or whatever else was on that ship. Fred's seed of doubt had already taken root. He didn't know whether to be grateful or resent the old man. Between the distances and their respective velocities, it looked like it would be tricky. Naomi had been burning hard toward Earth, and the speed the *Chetzemoka* had built up was almost all in the wrong direction to reach him. If it wasn't a trap and Naomi was in trouble, he could still be too late. The UN force might be able to help, but she was already peeling away from their flight path.

Which still didn't leave him entirely without resources. He flipped to comms and started recording.

"Alex, since you're in the neighborhood and it went so well the last time I asked you to check out a mystery ship, I was wondering if you'd be interested in making a little detour."

OceanofPDF.com

Chapter Forty-three: Alex

The worst thing was not knowing. The newsfeeds were awash with information, but very little of it matched up. Four billion were dead on Earth. Or seven. The ash and vapor that had turned the blue marble to white was starting to thin already—much sooner than the models predicted. Or the surface of the Earth wouldn't see daylight and blue skies for years. It was the dawn of a resurgence of natural flora and fauna driven by the human dieback or it was the final insult that would crash a perennially overstressed ecosystem.

Three more colony ships had been captured on their way to the ring gate and turned back or boarded and the crews spaced, or else seven had, or it was only one. Ceres Station's announcement that Free Navy ships could use the docks was a provocation or a proof that the OPA was unified or the station administration was giving in to fear. All around the system, ships were turning off their transponders, and the systems for visual tracking of the exhaust plumes were getting dusted off and reprogrammed in languages that contemporary systems could parse. Alex told himself it was temporary, that in a few months, maybe a year, everyone would run with transponders again. That the Earth would be the center of human civilization and culture. That he would be back on the *Roci* with Holden and Naomi and Amos.

He told himself that, but he was getting less and less persuasive. Not knowing was the worst thing. The second-worst thing was being chased by a bunch of top-of-the-line warships that really wanted to kill you.

In the display, one of their escort missiles went from green to amber to flashing red.

"Shit," Bobbie said. "Lost one."

"It's all right. We've got plenty more."

In the past hours, the *Pella* and her pack had come up with the bright idea of coordinating their comm lasers to hit a particular missile and then pumping energy into it until the controls overheated. The missiles failed inert, or they would have figured the enemy strategy out when the escorting cloud had cooked off in a massive chain reaction. Instead, they'd lost four missiles in half an hour and put together what was happening. Bobbie and the *Razorback's* antiquated and underpowered system had designed a rolling pattern formation for the missiles that kept any one of them from being in an uninterrupted sightline for more than a few seconds at a time. Watching it on the cameras reminded Alex of documentaries he'd seen about deep sea fish on Earth, vast schools roiling and yet staying together. Only for him, it was their little group of remaining missiles.

Ever since the announcement by the Free Navy, the prime minister had been back in the cabin, using their own tightbeam for what sounded like a hundred furious conversations that all seemed to have the same timbre. Alex couldn't quite make out all the words and he made conscious effort not to listen in case someone asked later what he knew. But the phrases *not substantiated* and *significant failure* and *still investigating* all came through enough times that Alex started to recognize them, kind of like hearing a song often enough that the lyrics became clearer.

His monitor was divided between a large-scale map of the solar system highlighting the parts of it critical to him—the *Razorback*, the UN military escort burning out to meet them, the *Rocinante*, the *Pella* and its pack, Tycho Station, Mars, Earth, Luna—and a smaller inset that was the *Razorback's* internal systems diagnostics. The little pinnacle hadn't been intended for full interplanetary travel, and with Earth and Mars where they were, they were going to be cutting it pretty close. The reactor had enough fuel pellets to burn for months, but once they ran out of ejection mass, the drive wouldn't do them much good. So far, they were still inside the error bars. Which, for him, meant that even if they ran out, they'd be going slow enough that someone could come throw a tether on them. Rescued by professionals was still firmly in his win column.

The navigation system threw an alert to his monitor. He opened it.

"What've you got?" Bobbie asked.

"The *Pella* and her little friend there cut their drives again," Alex said. "And... Hey! I think... Some of the ships are peeling off. I think they're

giving up!”

Bobbie whooped and Smith stopped his conversation in the back long enough to come see what was going on. By the time Alex had explained it all, the *Pella* had its drive on too, and was turning with the others. Not a full flip-and-burn, but a kind of fishtail slide that kept a good fraction of their momentum while still setting them on a course for the Belt and, give or take a few million kilometers, the Jovian system. The *Chetzemoka* peeled off in the opposite direction. Whatever mission the *Pella* was on, it was leaving the *Razorback* behind.

A tension Alex hadn't been consciously aware of started to evaporate along with Bobbie's occasional whoops and laughter. The UN escort force checked in. The solar flares weren't even coming close to intersecting with their path. The *Razorback*'s heat sinks were coping with the radiant heat well enough. Alex let himself relax.

It lasted almost half an hour.

“This is Naomi Nagata of the *Rocinante*. If you get this message, please retransmit. Tell James Holden I am in distress. Comm is not responding. I have no nav control. Please retransmit...”

And then forty minutes after that:

“Alex, since you're in the neighborhood and it went so well the last time I asked you to check out a mystery ship, I was wondering if you'd be interested in making a little detour. I'm having my temporary pilot figure out a fast burn that will get me to Naomi, but you're closer and you're going in nearly the same direction. There's a chance this is the bad guys trying to trick us, so keep your eyes open. If it is Naomi, though, make sure she's still breathing when I get there. Let me know what you think.”

Alex's jaw was clenched hard enough his teeth ached. He already knew what Bobbie was going to say, so instead of starting the conversation, he started quietly feeding data into the nav system and seeing what options were open depending on how hard he wanted to burn and how much fuel he had left, and what telemetry said about the little ship and the convoy it broke off from. The wall screens were set to mimic the exterior view, so

when he looked up from the navigation data, he could pick out the dot of light that was her drive plume. He also pulled up an audio feed matched to the broadcast from it. “This is Naomi Nagata of the *Rocinante*. If you get this message, please retransmit...”

He could feel the disapproval radiating up from behind him. Bobbie didn’t say anything at first, didn’t even make a grunt or a noise. It didn’t matter. Alex knew. When she finally did speak, it was almost a relief to have it out in the open.

“What are you doing there, sailor?” Bobbie asked.

“Figuring the best way to go after Naomi.”

“Any reason you’re doing it?”

“Because we’re going after Naomi.”

“We’re almost at the flip part of the flip-and-burn. Any course changes we make are going to eat up a lot of fuel.”

Alex didn’t look back. Just gestured at the screen. “The way I figure, that’s a distress call. We logged it. We’re obligated to stop.”

“Don’t,” Bobbie said.

“That’s the rules.”

“Don’t throw the rule book at me. We’ve got a mission here. I don’t like it any more than you do, but we need to stand our post. We’ve got orders.”

Alex’s jaw hurt worse. He tried yawning to stretch the ache away. It didn’t work. He turned his crash couch to face her. With her helmet off and her hair pulled back in a tight, functional ponytail, her head seemed small. The power armor was still locked in place, hands in fists against each side of the ship. If she decided to disable him and take command of the pinnace, she was just going to win. Also, he needed to keep in mind that she was jerry-rigged in place, and probably couldn’t actually take a really high-g burn without coming loose.

“We do,” he said. “We’ve got orders. But you’ve got orders from Nate and Avasarala, and I absolutely respect how you look out for both of those. But I got orders from my captain, and the watch I need to stand is over that way and getting farther from us.”

“You’re not thinking with your head,” Bobbie said. “Look at the risk profile, Alex, because if we go, we’re taking a risk. If we win, we get Naomi Nagata out of trouble. If we lose, the leader of one of the most important political organizations in the human race dies at a time when

unity and leadership is critically important. No, stop. I know what you're thinking. I've thought it too, just about some other people. Naomi's yours. She's one of the people in your circle, and fuck if you're going to risk her, much less sacrifice her for some kind of vague greater good, right?"

Alex closed his mouth, paused. "Right."

"I understand that," Bobbie said. "I do. I had to train a lot to understand that isn't what we do. You had that training too. Whether we're on active duty or not doesn't matter. We serve Mars because we swore an oath. If doing the right thing was the same as doing the easy thing, we wouldn't have had to swear. We have the prime minister of Mars in this ship. We have a military escort coming to get him safely to Luna."

"And we have the enemy out there," Alex said, hating the words as he said them. "It's a trap, isn't it?"

"I don't know," Bobbie said. "It could be. Disable someone and shoot the responders is a dirty trick, but I wouldn't put it past these bastards."

"I don't see how going after her would put us in more danger than holding course," Alex said. "If they've got a rail gun pointing at us, they can hole us right here just as well as over there."

"Trojan horse," Bobbie said. "Pack that thing full of soldiers. If we dock with her, all these missiles aren't going to help a damned bit. Or if the *Rocinante* gets to it, they take Fred Johnson."

"The odds of—"

"Don't think about the odds," Bobbie said. "Think about the stakes. Think how much we lose if we take the risk and it goes wrong."

Alex's head felt thick, like the first stages of illness. He looked back at his nav panel. The distance between the *Razorback* and *Chetzemoka* increased with every second. He took a deep breath, blew out. Naomi's voice came softly from the feed. "Tell James Holden I am in distress. Comm is not responding. I have no nav control..."

The voice that came from the cabin space was soft, gentle, conversational. "An interesting analysis, but incomplete."

Nathan Smith stood in the doorway. His hair was greasy and disarrayed. His clothes looked like they'd been slept in. His eyes were bloodshot, the rims red and angry. Alex thought he looked a decade older than when they'd taken off. The prime minister smiled at Alex, then Bobbie, then Alex again.

“Sir,” Bobbie said.

“You’ve neglected a term, Sergeant. Consider what we stand to lose if we don’t make the attempt.”

“The reason for doing this,” Alex said. “The reason for doing any of this. If there’s a chance—and I think there’s a pretty damned good one—that Naomi managed her own escape, and she’s out there and in distress, and she’s called for help, you know what the rules are? That we stop and help. Even if she’s not someone we know. Even if it was someone else’s voice. That’s the rule, because out here, we help each other. And if we stopped doing that because we’re more important or because the rules don’t apply to us anymore, I can make a decent case that we’ve stopped being the good guys.”

Smith beamed. “That was beautiful, Mister Kamal. I had been thinking of explaining to Chrisjen Avasarala that we’d left our only solid witness to the *Pella* behind, but I think I like your version better. Set course and alert the UN escort to our change of plans.”

“Yes, sir,” Alex said. When the door closed, he turned to Bobbie. “Sorry.”

“Don’t be,” Bobbie said. “It’s not like I didn’t want to go after her.”

“And if it turns out the ship’s full of soldiers?”

“I can take this suit out for a drive,” Bobbie said. “Won’t hurt my feelings.”

It only took a few minutes to set the optimal intercept course and fire off a flight plan to the UN escort ships. Afterward, he recorded a tightbeam message for Holden. “Hey there, Cap’n. We’re on our way, but we’ll be careful. Get in, take a good look, and if anything’s getting our hackles up, we won’t board. Meantime, you tell that pilot you’ve got that whoever makes rendezvous first owes the other fella a beer.”

Chapter Forty-four: Naomi

Even a steady one g could be unpleasant for her. The constant press of two was a slow torture. It began as a deep ache in her knees and the base of her spine, then progressed quickly to sharp pain, like a needle stuck into the joints. Naomi surveyed the *Chetzemoka* in stages, moving through a deck, then lying down until the pain lessened, then the next deck. Her hands and feet hurt even as the swelling subsided. Her cough didn't get better, but it didn't get worse.

The first disappointment was that the controls were in lockdown. She tried a few passwords—FreeNavy and Marcoisgreat and Filip—but even if she got it right, there was no reason to expect that they'd left the biometrics profiles turned off.

The lockers by the airlock hung open and empty. The three EVA suits that remained didn't have batteries or air bottles. The emergency rations were gone. She expected the toolboxes to be gone from the machine shop, but they'd taken out the racks that held them too, the drawers from the cabinets, the LEDs from the wall lights. The crash couches were all slit open, gel and padding pooled on the deck beside them. The drug delivery system and reservoirs were gone. The only water was in the drives; ejection mass to be spit out the back of the ship. The only food was the residue in the recyclers that hadn't been processed back into anything edible. The stink of welding rigs and burning still hung in the air, so the air recycler was probably running unfiltered.

Naomi lay on the deck, her head resting on her hands, and her eyes closed. The ship had been constructed for one use and as an insurance write-off. Its working life had begun with it being disposable, and it had been looted from there. Even the physical panels and monitors had been

salvaged and carried away. As presents to Filip went, it was actually pretty crappy. The deck shook under her, the vibration of thrust setting up resonances that no system even tried to damp down. Between the high g and the vacuum damage leaking fluid into her lungs, breathing took more effort than it should have.

The ship wasn't a ship. She needed to stop thinking of it that way. It was a bomb. It was what she'd done to the *Augustín Gamarra* years ago and had carried with her ever since like a weight around her throat. Jim had known the kind of person that landed on water haulers like the *Canterbury*. He'd said that everyone there had reasons for being there. There were reasons the ship she'd tried to give to her son was stripped empty and triggered to kill. Not just her but anyone who came close to her. There were reasons. If she could defuse it, undo the threat, then she could follow it back, though. Take it to Ceres, where it had all started. There should be a way through the machine shop. All machine shops were supposed to be connected at the back.

She reached out her hands, only they weren't her hands. She was dreaming. She forced her eyes open and rolled to her back with an exhausted sob.

Okay. If she stopped moving now, she was going to sleep. That was good to know. She sat up, rested her head against the wall. *Sleep later. Sleep when you're dead. Or even better, sleep when you're safe.* She grinned to herself. Safe. That sounded like a good plan. She should try that for a change. She balled her hands into tight fists. The joints all screamed in pain, but when she opened them, her fingers moved better. That was probably a metaphor for something.

She had to set priorities. She didn't have a lot of resources. If she just grabbed at the first idea that came to her, it would be easy to exhaust herself without getting the critical work done. She needed to get food and water and make sure the air supply was reliable. She needed to warn anyone coming to save her not to approach. She needed to disarm the trap. Maybe dump core, maybe replace the drivers with a copy that didn't carry her poisoned code.

And she needed to do it before the ship blew up. At two g. Without tools or access to the controls. Or... was that right? Access to the controls was going to be hard, but she should be able to improvise some tools. The EVA

suits weren't powered and didn't have bottles, but they had seals and reinforcement. She could take the cloth apart, and salvage some lengths of wire. Maybe something solid enough to cut with. And could she use the helmet clamps as a kind of vise grip or clamp? She wasn't sure.

Even if she could, what would that gain her?

"More than you've got now," she said aloud. Her voice reverberated in the empty space.

All right. Step one, make tools. Step two, drop core. Or warn anyone coming in. She stood up and forced herself back to the airlock lockers.

Five hours later, she was on the ship's perfunctory little engineering deck, sealing the hatch manually. Two of the EVA suits had given up what little they had to offer to make a tiny, sketchy tool kit. Doing anything with the controls had failed. So she could be a rat in a box, or she could take out the middleman. After all, the controls all connected to machinery, and the machinery—some of it—was where she could put her hands on it.

The space between the hulls was in vacuum, and she didn't have any great faith that the outer hull was actually sealed. The one remaining suit held about five minutes' worth of air without a bottle and she could set the radio to passive and pick up the faintest echo of her own voice making the false message with the residual charge in the wires. The lock that should have let her get into and out of the maintenance access had been hauled off as salvage, but she could turn the full engineering deck into a makeshift airlock. Close the hatch to the rest of the ship, force the access panel into the space between hulls. She budgeted two minutes to locate something useful—a power repeater she could sabotage to force the drive to shut down, the wiring for the comm system, an unsecured console that was talking to the computers—then two minutes to get back out. Thirty seconds to close and seal the maintenance panel and pop the engineering hatch. She'd lose a roomful of air every time, but she'd only lose a roomful.

She put on the helmet and checked the seals, then opened the access panel. It fought her at first, then gave all at once. She thought she felt a rush of escaping air go past her, but it was probably her imagination. Twenty

seconds already gone. She crawled into the vacuum between the hulls. The darkness was so complete, it was like closing her eyes. She tapped the suit's controls, but no beam of light came from them.

She backed out, closed the access panel, opened the hatch, and took off her helmet.

"Light," she said to the empty space. "Going to need some light."

The monitor hung from wires, asking for her password. It just fit past the lip of the access panel, and filled the space between the hulls with light so dim, she couldn't see colors in it. Shadows of struts and spars made deeper darkness all around, and shapes she couldn't make sense of. She had forty-five seconds before she had to head back. It was the fifth time she'd been down trying to scrape through the coating on the wires. In a real ship, it would all have been protected by conduit. On this piece of crap, the wiring had all been fixed directly to the hull with a layer of yellowed silicone epoxy. On the one hand, it was a blessing. On the other, she was horrified that she'd ever trusted her life to the ship. If she'd inspected between the hulls before they left Ceres, she'd have been sleeping in an environment suit the whole way to the *Pella*.

The coating peeled free. Thirty seconds. She took a bit of salvaged wire and shorted the circuit. A fat spark leaped out and the world lurched. Across the space, maybe four meters away, an indicator light went amber, and she was falling sideways. With the extra illumination, she could see the round, tree-thick body of the maneuvering thruster. She put out her arms, catching herself against a steel strut. When she pressed her helmet to it, the rumble of the drive drowned out the ghost-quiet radio. She reached for the wire, broke the connection, and the rumble stopped.

Out of time, she turned back, her head swimming. The ship was spinning, then. She had no way to know how quickly, but the Coriolis was enough to make her stumble on the way back.

With the panel closed, the hatch open, and her helmet off again, she sat still until her balance came close to returning. Then, moving carefully, drunkenly, she scratched the new information on the wall. She was

developing a crude map of the ship's secret interior and keeping track of all she learned. She was tired enough not to trust her memory. From the count she'd started, she knew she'd been on thirty sorties. Now, for the first time, she'd done something. It was only one thruster, but the ship was spinning now, tumbling in circles instead of burning ahead in a line. All the acceleration would be bled into the changing angular momentum, and she wouldn't be going toward Jim as quickly. So maybe she'd bought a little time. It would make things harder for her, but she'd grown up in the Belt and on ships. Coriolis—and coping with the sick dizziness—was nothing new to her. She knew that the feeling of power and accomplishment she felt was out of scale with what she'd actually managed, but she grinned all the same.

Thirty sorties. Two and a half hours just of time spent in vacuum. That didn't count the minutes refreshing the air in her suit or planning out the next run. Maybe five hours total since she'd started this. She was exhausted. She felt it in her muscles and the pain in her joints. She hadn't eaten—couldn't eat. She was thirsty with the first strains of a dehydration headache coming on. There was no reason to think she would survive this. So she was surprised to notice that she was happy. Not the powerful, irrational, and dangerous joy of a euphoric attack, but a kind of pleasure and release all the same.

At first, she thought it was because there wasn't anyone there with her, guarding her, judging her. And that, she decided, was part of it. But more than that, she was simply doing what needed to be done without having to concern herself about what anyone else thought. Even Jim. And wasn't that odd? She wanted nothing in the world more than for Jim to be there—followed by Amos and Alex and a good meal and a bed at a humane gravity—but there was a part of her that was also expanding into the silence of simply being herself and utterly alone. There were no dark thoughts, no guilt, no self-doubt tapping at the back of her mind. Either she was too tired for that, or something else had happened to her while she'd been paying attention to other things.

This was the difference, she thought, between solitude and isolation. And now she knew something about herself she hadn't known before. It was an unexpected victory, and all the better for that.

She started getting ready for the thirty-first sortie.

She had almost a minute, because she'd figured out that coming up the comm array power supply took a lot longer than it did going back down. It was the sort of thing she'd have realized much more quickly if her mind hadn't been a little on the compromised side.

The comm system was held in place by more than epoxy. Long strips of metal tape lashed the transmitter in place, the welds still bright as if they'd been made yesterday. Three sorties ago—number forty-four—she'd thought there might be a diagnostic handset. Not that she could speak into it, but she might have been able to tap out a message. But despite the fact that handsets like that were standard and required, there wasn't one.

It had taken her some time to put together a backup plan.

For hours, the looped message had played in her ear, whispering on the back of residual charge. "This is Naomi Nagata of the *Rocinante*. If you get this message, please retransmit. Tell James Holden I am in distress. Comm is not responding. I have no nav control. Please retransmit..."

Thirteen seconds long, and barely louder than the sound of her breath, even with her head less than a meter from the transmitter. With the leads to the transmitter exposed, she was ready. She'd have four times through. It had to be enough that it wouldn't be mistaken for random interference. She pressed her head to the hull to distract from the whirling of her inner ear.

"This is Naomi Nagata," she said, matching the timing and cadence of her false self. "If you get this message, please retransmit. Tell James Holden I am in—" She slammed the wire onto the exposed leads. A shiver of electricity bit her fingertips even through the suit's gloves. The radio was silent, but she kept mouthing the words, replaying them like a song stuck in her head until the right moment, then yanked the wire free "—control. Please retransmit. This is Naomi Nagata of the *Rocinante*. If you get this message, please retransmit. Tell James Holden I am in—" Cut, pause. "—control. Please retransmit."

After the fourth time, she took the length of steel spring she'd been using as a knife and cut the transmitter. Her false voice went dead. She scrambled down, moving from strut to strut, watching her hands and feet with every movement so she wouldn't misjudge. The acceleration gravity

made her ankles and wrists feel unstable. The air in her suit didn't feel stale or close; the carbon dioxide scrubbers worked well enough on passive that she wouldn't feel the panic of asphyxiation. She'd just gently pass out and die.

She ducked into the engineering deck, closed the access panel. On the way to the hatch, her knee buckled. She popped the hatch open, ripped off her helmet, and sank down, gasping. Her vision narrowed, bright sparkles filling in her peripheral vision. She dry heaved once, paused, did it again, and let her body's weight sink deep into the deck below her.

Tell James Holden I'm in control for some really broad definition of control, she thought and laughed. Then coughed until her ribs hurt even worse. Then laughed again.

At her seventy-first sortie, she hit the wall. It wasn't subtle. She had closed the hatch to the main body of the ship, closed the seals, and put her helmet onto the environment suit. Before she fixed it into place and started the next five-minute count, her hands dropped to her sides. She hadn't consciously intended to do that; it had just happened. Alarmed in a vague, distant kind of way, she sat on the deck with her back against the wall and tried moving them. If she'd just become paralyzed or something, that would change the situation. Give her permission to stop. But her hands still flexed; her shoulders still moved. She was just exhausted. Even the effort to swallow seemed heroic. She closed her eyes, wondering if she'd instantly fall asleep, but she was too weary for that. So she sat.

If the suit had a battery, it would probably be cataloging the failures of her body right now. The dehydration headache was worse now, and moving in toward nausea. Her skin felt raw where the unshielded sun had burned her. Though she wasn't producing as much, she was still coughing. And she figured her blood was probably about equal parts plasma and fatigue poisons by now.

Her two little victories—the thruster, the transmitter—had been the end. Since then, either her efforts had degraded or things had genuinely gotten more complicated, or both. The repeaters that would cause the core to shut

down had either been omitted in the build or were tucked someplace that couldn't be reached from between the hulls. The sensor array that would trigger the bottle failure when a rescue ship got too close would have been a lovely thing to access, but it appeared to be mounted on the exterior where she couldn't get to it. There were half a dozen places she could have tried tapping into the computer system, but none of them had interfaces, and she didn't have any she could bring. Other plans and strategies flickered through her mind from time to time like fireflies. Some of them might have been good. She couldn't keep hold of them long enough to say.

She might have slept or the timeless skipping might just have been how her brain worked now. The voice she heard was just a whisper fainter than her own voice had been, but it snapped her back to herself.

"Hey there, *Chetzemoka*. This is Alex Kamal presently of the *Razorback*. Naomi? If you're there, I'd appreciate you giving me a sign. I'd sort of like to make sure it's you before we come over. Your ship's been acting a mite odd, and we're a little on the jumpy side. And, just in case it's not Naomi Nagata? I've got fifteen missiles locked on you right now, so whoever you are, you might want to talk with me."

"Don't," she said, knowing he couldn't hear her. "Stay away. Stay away."

Everything hurt. Everything whirled. Nothing was easy. When she got to her feet, her head swam. She was afraid she was going to pass out, but if she bent over, she wasn't sure she'd have the strength to stand back up. She had to find a way to wave him off. She had to keep him from getting close enough to be caught in the blast. Whether it saved her life or not didn't matter. She'd had her good day. It was more than she'd expected, and she was so deeply weary...

Breathing hard, she opened the engineering hatch for the last time and stumbled for the lift. And after the lift, the airlock.

Chapter Forty-five: Amos

Even though it was strictly local, running off the *Zhang Guo*'s system, it was nice having working hand terminals again. Amos lay on a support wedged in the narrow space between the hulls. The rest of his work team was only the soft clanging of magnetic clamps and the gentle, soothing smell of a welding torch. The meter he had clipped to the power line was at zero.

"Now?" Peaches said.

"Nothing."

A couple seconds passed.

"Now?"

"Nothing."

Another second. The meter chirped, the indicator going from zero to eighty-nine. Amos grinned. "That's it, Peaches. I'm a little shy of ninety."

"Locking that in," she said, and even though the hand terminals were set for audio, he knew she was smiling. He plucked the meter free and sprayed sealant over the holes he'd made for the leads. "Erich? If you're there, we're ready for another run."

"Of course I'm here," Erich said. "Where would I go? Starting the diagnostics run now. You two go stretch your legs or something."

Amos whistled once between his teeth, the shrill echo making the sound seem larger. "I'm taking a break. You guys get that conduit open, just wait for me. Don't try to do something smart."

There was a rough clatter of agreement as he swung out and up, climbing to the access panel with the handholds and the structural supports. The B-team wasn't much by way of help, but they could do some of the time-consuming easy stuff while Amos and Peaches and Erich made the

Zhang Guo skyworthy. So far, it had been as much cleaning up the servants' half-assed attempts to fix the ship as it had been finding why she'd been grounded in the first place. As showy as the ship was, her internal design was pretty nearly off-the-shelf. On the engineering deck, Amos dug up a cleaning rag and wiped the hardening shell of sealant off his fingers and wrist. Where it was thinnest, it was already solid, coming away from his skin like the shell off a shrimp.

Both doors of the airlock were open, and a portable stairway led down to the hangar floor. The windows were still dark, and a filthy, gritty rain tapped against the panes. The air smelled of ozone and cold, and Amos' breath ghosted. The overhead LEDs cast a harsh light, cutting shadows so distinct they looked fake. Stokes and the other household servants were clustered against one wall, clutching bags and hard cases and talking anxiously among themselves. Butch leaned against one wall, her hand to her ear in an attitude of concentration. Amos watched her as he came down the stairs. The woman radiated a sense of barely restrained violence. Amos had known a lot of people who had the same air about them. Some of them were criminals. Some were cops. She caught him staring and lifted her chin in something between a greeting and a challenge. He smiled amiably and waved.

He got to the hangar floor about the same time Peaches climbed out the airlock onto the stair. Stokes broke free of the huddled group and trotted over toward Amos, smiling anxiously. "Mr. Burton? Mr. Burton?"

"You can call me Amos."

"Yes, thank you. I wondered whether Natalia could perhaps go to the Silas house? Her husband is a janitor there, and she is afraid if she leaves without him, they will never see each other again. She's very worried, sir."

Peaches came down the stairs behind him with footsteps soft as a cat's. Her shadow spilled down the walkway in front of her. Amos scratched his arm. "Here's the thing. Pretty sure we're going to be able to start the final run-through in maybe forty-five minutes. Anyone who's here when we're done, they can bum a lift so long as there's room. Anybody not here should be far enough away they don't get burned down to their component atoms when we take off. Between those, I don't actually give a shit what any of you people do."

Stokes chuckled and made a short birdlike bob with his head. "Very

good, Mr. Burton. Thank you.” Amos watched him scamper away.

“Mr. Burton, is it?” Peaches said.

“Apparently,” Amos said, then lifted a thumb to point after Stokes. “Did he think I was joking about something? ’Cause I was just telling him how the sun comes up in the east.”

Peaches lifted a shoulder. “In his mind, we’re the good guys. Everything we say, he interprets that way. If you say you don’t care if he lives or dies, it must be your dry gallows humor.”

“Seriously?”

“Yep.”

“That’s a really stupid way to go through life.”

“It’s how most people do.”

“Then most people are really stupid.”

“And yet we made it to the stars,” Peaches said.

Amos stretched out his arms, the muscles across his shoulders hurting pleasantly. “You know, Peaches, it’s nice how we got all this help and stuff, but I kind of liked it better when it was only you and me.”

“You say the sweetest things. I’m going to track down some coffee or tea. Or amphetamines. You need anything?”

“Nope. I’m solid.” He watched her walk away. She was still way too thin, but since he’d stepped into the room in the Pit at Bethlehem, she’d taken on a kind of confidence. He wondered, if she had to go back, whether she still wanted him to kill her. Probably something worth asking about. He stifled a yawn and tapped his hand terminal. “How’s it looking up there?”

“Not throwing any errors yet,” Erich said. “So this is what you do now?”

“This is what I’ve been doing for years.”

“And you can make a living this way?”

“Sure, if you don’t mind weird-ass aliens and corporate security assholes trying to kill you now and then.”

“Never minded before,” Erich said. “Okay, that’s it. We’re at the end of the run. I got that one hiccup from the water recycler, but everything else is good to go.”

“If we’re in this brick long enough to recycle the water, something will have gone badly wrong.”

“That’s what I was thinking too. You want me to start firing the reactor up? They’ve got scripts and a checklist.”

“Yeah, why don’t you let me take—”

The hand terminal squawked and a man’s voice Amos didn’t recognize came on. “Boss? I think we’ve got company.”

“What’re you seeing?” Erich snapped.

“Three trucks.”

“Okay, fuck it,” Erich said. “I’m starting up the reactor.”

Amos trotted toward the front of the hangar. The lookouts at the windows were all standing and tense. They knew. The servants were still milling in their corner, out of the way. “Yeah, I’d go ahead and run the check first,” he said. “It’d be a shame to do all this just so we could give the folks in Vermont a nice light show.”

The silence was harsh. Amos didn’t understand what the problem was until Erich spoke again. “I don’t take orders from you. *Burton.*”

Amos rolled his eyes. He shouldn’t have said that on an open channel. So many years and so many catastrophes, and it was still all about not losing face. “I was thinking of it more as expert opinion,” Amos said. And then, “Sir.”

“Noted. While I take my time to do that, how about you go help hold the perimeter,” Erich said, and Amos grinned. Like he wasn’t already on his way to do that. Erich went on. “Walt, start getting the passengers in the ship. Clarissa can assist with the start-up.”

“On my way,” she said, and Amos saw her running across the hangar for the stairs. Stokes was watching her with alarm. Amos waved him over.

“Mr. Burton?” the man said.

“That girl going after her old man? Yeah, she might need to rethink that.”

Stokes went pale and searchlights brighter than the sun flooded through the hangar windows. A voice echoed through bullhorns, barking syllables too muddled by the echo to be words. It didn’t matter. They all got the gist. By the time Amos got to the front doors, there were figures in the lights. Men in riot gear approaching the hangar with assault rifles in their hands that looked a little more heavy-duty than crowd control demanded. The servants were lined up on the stairs to the ship’s airlock, but they weren’t moving fast. One of Erich’s men—maybe twenty years old with a red scarf at his neck—handed Amos a rifle and grinned.

“Aim for the lights?”

“Any plan’s better than no plan,” Amos said, and broke the windowpane out with the butt of the rifle. The gunfire started before he could flip the barrel around to take aim. It roared like a storm, no gap between one report and the next. Somewhere people were screaming, but Erich and Peaches were in the ship and Holden and Alex and Naomi were somewhere off-planet and Lydia was safely dead. There was only so much to worry about. The guy next to him was screaming a wordless war cry. Amos took aim, breathed out, squeezed. The rifle kicked, and one of the glaring lights went out. Then someone else got another one. One of the Pinkwater soldiers pulled back an arm to throw something, and Amos shot them in the hip. A second after they went down, the grenade they dropped flashed and a plume of tear gas rose up through the falling rain.

Someone—Butch, it sounded like—yelled “Push ’em back!” and Amos crouched down, squinting back at the *Zhang Guo*. The civilians were almost all on, Stokes at the back waving his arms and yelling to hurry them. Something detonated, blowing the glass out of the remaining windows. The shock wave thudded through Amos’ chest like the explosion had kicked him. He stood up, glanced through the window, and shot the nearest figure in the face. The deeper rattle came from outside, and stuttering muzzle flash brighter than the remaining lights. Holes appeared in the wall, beams of light shining through into the vast cathedral space of the hangar.

“We got to get out of here!” Scarf Boy shouted.

“Sounds good,” Amos said, and started walking backward, firing through the window. A half second later, Scarf Boy was with him. The others either noticed them or had already reached the same conclusion. Two were already on the stairs, shooting as they climbed. At this point, no one was trying to hit anything; they were just keeping the others from advancing too fast for everyone to get on board. Amos’ rifle went dry. He dropped it and jogged back to the stairs, holding his hand terminal to his ear as he went.

“How’re we doing?” he shouted.

“You’re very clever,” Peaches yelled back. “We had a power hiccup on start-up. Would have lost maneuvering thrusters.”

“We going to lose them now?”

“Don’t think so.”

“Good.”

He stopped at the base of the stairs. Scarf Boy crouched behind him, reloading his assault rifle. When he had the new magazine in, Amos plucked it out of his hands and pointed at the stairway with his chin. Scarf Boy nodded thanks and scuttled up the steps, his head low. Shadows danced on the windows, and the side door burst in with a three-person team rushing in. Amos mowed them down. Half a dozen of Erich's people were on the stairs now, some still shooting as they climbed. One of them—Butch—stumbled as she got to the fourth step up. Blood soaked her arm and the side of her neck. Amos held the assault rifle up, spraying the walls, and knelt beside her.

“Come on,” he said. “Time to go.”

“Don't think that's happening,” Butch said.

Amos sighed. He put his hand terminal in his pocket, took the woman's collar in one hand and the rifle's grip in the other, and ran up the steps to the rattle of his own gunfire. The woman screamed and bounced. Something exploded, but Amos didn't pause to figure out what. At the airlock, he hauled Butch through, fired one last burst down the stairway, and hit the controls to cycle the lock closed.

All around him, Erich's people and the house servants were huddled. Some were covered in blood. He was covered in blood. He was pretty sure it was all Butch's, but not a hundred percent. Sometimes, in the heat of the moment, he missed things like getting shot. He let Butch down to the deck and pulled out his hand terminal.

“Okay,” he said. “Now would be good.”

“The exhaust's going to kill everyone out there,” Erich said.

“Are we caring about that?” Amos shouted.

“I guess not.”

The drive roared to life. “Lay down!” Amos shouted. “We don't have time to get to couches. Everyone lay down. You want the thrust spread out over your whole body!”

He lay down beside Butch. Her eyes were on him with something that might have been pain or anger. She didn't speak, and neither did he. Erich's voice came over the ship's system, telling them to brace, and then Amos weighed a whole lot more than he had a few seconds before. A loud crunching sound rattled the deck—the *Zhang Guo* pushing through the hangar's roof on her way to the sky. The ship rattled, dropped, rose again.

The deck pressed into Amos' back. If they had to make any hard turns, there were going to be at least a dozen people all mushed together in the corner where the deck met the wall.

The screen over the engineering controls flickered to life; clouds and rain falling down onto the forward cameras as the ship rose. Lightning flickered, the thunder rolling through the ship. He couldn't remember if a standard orbital escape called for three gs or four, but whatever it was would have been a whole hell of a lot more fun in a crash couch. His jaw ached, and he had to remember to clench his arms and legs to keep from passing out. All around him, the others weren't remembering that in time, or more likely never knew. Most of them, this was their first time up the well.

Over the course of long minutes, the rain and clouds on the screen faded. The lightning fell away behind them. Then, through the featureless gray, the first shining stars. Amos laughed and whooped, but no one joined him. Looking around, he seemed to be the only one still conscious, so instead, he lay back on the deck and waited for the thrust gravity to drop out when they hit orbit.

The stars slowly grew brighter, twinkling at first as the last gritty layers of atmosphere passed by them, and then growing steady. The Milky Way appeared like a dark cloud lit from behind. The thrust gravity began to ease and he got to his feet. Around him, other people were starting to come back to themselves. Scarf Boy and the others were hauling Butch out to the lift and the med bay, assuming the *Zhang Guo* had one of those. Stokes and the others were laughing or weeping or staring off in shock and disbelief. Amos checked himself for wounds and, apart from a series of four deep, gouging scrapes along his left thigh whose origins he couldn't recall, felt fine.

He turned his hand terminal to the open channel. "This is Amos Burton. You guys mind if I come up to ops?"

"You can do that, Burton," Erich said. There was maybe just a hint of smug in his voice. This saving face for Erich thing was going to get old fast, but right at the moment, he was feeling too high to care.

The ops deck was offensively lush. The anti-spalling had been made to look like red-velvet wallpaper and the light came from silver-and-gold sconces all along the walls. Erich sat in the captain's couch. His good hand was moving over the deck in his lap, his bad one holding on to the straps.

Peaches was in the navigator's couch, her eyes closed and her smile beatific.

"Grab a couch," Erich said with a grin. His old friend and not the criminal boss who needed to keep Amos in his place. He switched to the ship system. "Brace for maneuvers. Repeat, brace for maneuvers."

"That's not how they really do that," Amos said, strapping in at communications. "That's just something they say in the movies."
